The Letters of Cicero are thoroughly natural—colloquia absentium amicorum, to use his own phrase. Cicero's letters to Atticus, and to the friends with whom he was completely at his ease, are the most sincere and immediate expression of the thought and feeling of the moment. They let us into the secret of his most serious thoughts and cares, and they give a natural outlet to his vivacity of observation, his wit and humour, his kindliness of nature. It shows how flexible an instrument Latin prose had become in his hands, when it could do justice at once to the ample and vehement volume of his oratory, to the calmer and more rhythmical movement of his philosophical meditation, and to the fresher exchange of thought and feeling in the everyday intercourse of life.

Among the many rival orators of the age the most eminent were Quintus Hortensius Oratulus and C. Julius Caesar. Caesar was the leading representative of the Asiatic or florid style of oratory, and, like other members of the aristocracy, such as C. Memmius and L. Manlius Torquatus, and like Q. Catulus in the preceding generation, was a kind of dilettante poet and a precursor of the poetry of pleasure, which attained such prominence in the elegiac poets of the Augustan age. Of C. Julius Caesar (102–44) as an orator we can judge only by his reputation and by the testimony of his great rival and adversary Cicero; but we are able to appreciate the special praise of perfect taste in the use of language attributed to him.1 In his Commentaries, by laying aside the ornaments of oratory, he created the most admirable style of prose narrative, the style which presents interesting events in their sequence of time and dependence on the will of the actor, rapidly and vividly, with scarcely any colouring of personal or moral feeling, any oratorical passion, any pictorial illustration. While he shows the persuasive art of an orator by presenting the subjagation of Gaul and his own action in the Civil War in the light most favourable to his claim to rule the Roman world, he is entirely free from the Roman fashion of self-laudation or disparagement of an adversary. The character of the man reveals itself especially in a perfect simplicity of style, the result of the clearest intelligence and the strongest sense of personal dignity. He avoids not only every unusual but every superfluous word; and, although no writing can be more free from rhetorical colouring, yet there may from time to time be detected a glow of sympathy, like the glow of generous passion in Thucydides, the more effective from the reserve with which it betrays itself whenever he is called on to record any act of personal heroism or of devotion to military duty.

In the simplicity of his style, the directness of his narrative, the entire absence of any didactic tendency, Caesar presents a marked contrast to another prose writer of that age, the historian C. Sallustius Crispus or Sallust (c. 86–35). Like Varro, he revived Cicero by some extent, but he was more one and spirit in which his works are written assign him to the republican era. He was the first of the purely artistic historians, as distinct from the annalists and the writers of personal memoirs. He imitated the Greek historians in taking particular actions—the Jugurthan War and the Catilinarian Conspiracy—as the subjects of artistic treatment. He wrote also a continuous work, Historiae, treating of the events of the twelve years following the death of Sulla, of which only fragments are preserved. His two extant works are more valuable as artistic studies of the rival parties in the state and of personal character than as trustworthy narratives of facts. His style aims at effectiveness by pregnant expression, sententiousness, archaism. He produces the impression of caring more for the manner of saying a thing than for its truth. Yet he has great value as a painter of historical portraits, some of them those of his contemporaries, and as an author who had been a political partisan and had taken some part in making history before undertaking to write it; and he gives us, from the popular side, the views of a contemporary on the politics of the times. Of the other historians, or rather annalists, who belong to this period, such as Q. Claudius Quadrigarius, Q. Valerius Antias, and C. Licinius Macer, the father of Calvus, we have only fragments remaining.

The period was also remarkable for the production of works which we should class as technical or scientific rather than literary. The activity of one of these writers was so great that he is entitled to a separate mention. This was M. Terentius Varro, the most learned not only of the Romans but of the Greeks, as he has been called. The list of Varro's writings includes over seventy treatises and more than sixty hundred books dealing with topics of every conceivable kind. His Memispeae Satureae, miscellanies in prose and verse, of which unfortunately only fragments are left, was a work of singular literary interest. His Animae of Ennius no great and original poem had appeared. The powerful poetical force which for half a century continued to be the strongest force in literature, and which created masterpieces of art and genius, first revealed itself in the latter part of the Ciceronian age. The conditions which enabled the poetic genius of Italy to come to maturity in the person of T. Lucretius Carus (96–55) were entire seclusion from public life and absorption in the ideal pleasures of contemplation and artistic production. This isolation from the familiar ways of his contemporaries, while it was, according to tradition and the internal evidence of his poem, destructive to his spirit's health, resulted in a work of genius, unique in character, which still stands forth as the greatest philosophical poem in any language. In the form of his poem he followed a Greek original; and the stuff out of which the texture of his philosophical argument is framed was derived from Greek science; but all that is of deep human and poetical meaning in the poem is his own. While we recognize in the De Rerum Natura some of the most powerful poetry in any language and feel that few poets have penetrated with such passionate sincerity and courage into the secret of nature and some of the deeper truths of human life, we must acknowledge that, as compared with the great didactic poem of Virgil, it is crude and unformed in artistic design, and often rough and unequal in artistic execution. Yet, apart altogether from its independent value, by his speculative power and enthusiasm, by his revelation of the life and spectacle of nature, by the fresh creativeness of his diction and the elevated movement of his rhythm, Lucretius exercised a more powerful influence than any other on the art of his more perfect successors.

While the imaginative and emotional side of Roman poetry was so powerfully represented by Lucretius, attention was directed to its artistic side by a younger generation, who moulded themselves in a great degree on Alexandrian models. Such were Valerius Catullus also a distinguished literary critic, and T. Lucretius Calvus, an eminent orator. Of this small group of poets one only has survived, fortunately the man of most genius among them, the bosom-friend of Calvus, C. Valerius Catullus (84–54). He too was a new force in Roman literature. He was a provincial by birth, although early brought into intimate relations with members of the great Roman families. The subjects of his best art are taken immediately from his own life—his loves, his friendships, his travels, his animalities, personal and political. His most original contribution to the substance of Roman literature was that he first shaped into poetry the experience of his own heart, as it had been shaped by Alcaeus and Sappho in the early days of Greek poetry. No poet has surpassed him in the power of vitally reproducing the pleasure and pain of the passing hour, not recalled by idealizing reflection as in Horace, nor overlaid with mythological ornament as in Propertius, but in all the keeness

1 Latine loqui elegansistime.
of immediate impression. He also introduced into Roman literature that personal as distinct from political or social satire which appears later in the Epodes of Horace and the Epigrams of Martial. He anticipated Ovid in recalling the stories of Greek mythology to a second poetical life. His greatest contribution to poetic art consisted in the perfection which he attained in the phalaecean, the pure iambic, and the saccen metres, and in the ease and grace with which he used the language of familiar intercourse, as distinct from that of the creative imagination, of the rostra, and of the schools, to give at once a lifelike and an artistic expression to his feelings. He has the interest of being the last poet of the free republic. In his life and in his art he was the precursor of those poets who used their genius as the interpreter and minister of pleasure; but he rises above them in the spirit of personal independence, in his affection for his friends, in his keen enjoyment of natural and simple pleasures, and in his power of giving vital expression to those feelings.

Third Period: Augustan Age, 42 B.C. to A.D. 17.

The poetic impulse and culture communicated to Roman literature in the last years of the republic passed on without any break of continuity into the literature of the succeeding age. One or two of the circle of Catullus survived into that age; but an entirely new spirit came into the literature of the new period, and it is by new men, educated indeed under the same literary influences, but living in an altered world and belonging originally to a different order in the state, that the new spirit was expressed. The literature of the later republic reflects the sympathies and prejudices of an aristocratic class, sharing in the conduct of national affairs and living on terms of equality with one another; that of the Augustan age, first in its early serious enthusiasm, and then in the licence and levity of its later development, represents the hopes and aspirations with which the new monarch was ushered into the world, and the pursuit of pleasure and amusement, which becomes the chief interest of a class cut off from the higher energies of practical life, and moving in the refining and enervating atmosphere of an imperial court. The great inspiring influence of the new literature was the enthusiasm produced first by the hope and afterwards by the fulfilment of the restoration of peace, order, national glory, under the rule of Augustus. All that the age longed for seemed to be embodied in a man who had both in his own person and by inheritance the natural spell which sways the imagination of the world. The sentiment of hero-worship was at all times strong in the Romans, and no one was ever the object of more sincere as well as more superficial worship than Augustus, however, by his equals in station that the first feeling was likely to be entertained. The earliest to give expression to it was Virgil; but the spell was soon acknowledged by the colder and more worldly-wise Horace. The disgust aroused by the anti-national policy of Antony, and the danger to the empire which was averted by the result of the battle of Actium, combined with the confidence inspired by the new ruler to reconcile the great families as well as the great body of the people to the new order of things.

While the establishment of the empire produced a revival of national and imperial feeling, it suppressed all independent political thought and action. Hence the two great forms of prose literature which drew their nourishment from the struggles of political life, oratory and contemporary history, were arrested in their development. The main course of literature was thus for a time diverted into poetry. That poetry in its most elevated form aimed at being the organ of the new empire and of realizing the national ideals of life and character under its auspices; and in carrying out this aim it sought to recall the great memories of the past. It became also the organ of the pleasures and interests of private life, the chief motives of which were the love of nature and the passion of love. It sought also to make the art and poetry of Greece live a new artistic life. Satire, debauched from comment on political action, turned to social and individual life, and combined with the newly-developed taste for ethical analysis and reflection introduced by Cicero. One great work had still to be done in prose—a retrospect of the past history of the state from an idealizing and romanticizing point of view. For that work the Augustan age, as the end of one great cycle of events and the beginning of another, was eminently suited, and a writer who, by his gifts of imagination and sympathy, was perhaps better fitted than any other man of antiquity for the task, and who through the whole of this period lived a life of literary leisure, was found to do justice to the subject.

Although the age did not afford free scope and stimulus to individual energy and enterprise, it furnished more material and social advantages for the peaceful cultivation of letters. The new influence of patronage, which in other times has chilled the genial current of literature, become, in the person of Maccenas, the medium through which literature and the imperial policy were brought into union. Poetry thus acquired the tone of the world, kept in close connexion with the chief source of national life, while it was cultivated to the highest pitch of artistic perfection under the most favourable conditions of leisure and freedom from the distractions and anxieties of life.

The earliest in the order of time of the poets who adorn this age—P. Vergil Maro or Virgil (70–19)—is also the greatest in genius, the most richly cultivated, and the most perfect in art. He is the idealizing poet of the hopes and aspirations and of the purer and happier life of which the age seemed to contain the promise. He elevates the present by associating it with the past and future of the world, and sanctifies it by seeing in it the fulfilment of a divine purpose. Virgil is the true representative poet of Rome and Italy, of national glory and of the beauty of nature, the artist in whom all the efforts of the past were made perfect, and the unapproachable standard of excellence to future times. While more richly endowed with sensibility to all native influences, he was more deeply imbued than any of his contemporaries with the poetry, the thought and the learning of Greece. The earliest efforts of his art (the Elegies) reproduce the cadences, the diction and the pastoral fancies of Theocritus; but even in these imitative poems of his youth Virgil shows a perfect mastery of his materials. The Latin hexameter, which in Ennius and Lucretius was the organ of the more dignified and majestic emotions, became in his hands the most perfect measure in which the softer and more luxurious sentiment of nature has been expressed. The sentiment of Italian scenery and the love which the Italian peasant has for the familiar sights and sounds of his home found a voice and a form through Virgil.

In the Georgics we are struck by the great advance in the originality and self-dependence of the artist, in the mature perfection of his workmanship, in the deepening and strengthening of all his sympathies and convictions. His genius still works under forms prescribed by Greek art, and under the disadvantage of having a practical and utilitarian aim imposed on it. But he has ever in form so far surpassed his originals that he alone has gained for the pure didactic poem a place among the highest forms of serious poetry, while he has so transmuted his material that, without violation of truth, he has made the whole poem alive with poetic feeling. The homeliest details of the farmer's work are transfigured through the poet's love of nature; through his religious feeling and his pious sympathy with the sanctities of human affection; through his patriotic sympathy with the national greatness; and through the rich allusiveness of his art to everything in poetry and legend which can illustrate and glorify his theme.

In the Elegies and Georgics Virgil is the idealizing poet of the old simple and hardy life of Italy, as the imagination could conceive of it in an altered world. In the Aeneid he is the idealizing poet of national glory, as manifested in the person of Augustus. The epic of national life, vividly conceived but rudeley executed by Ennius, was perfected in the years that followed the decisive victory at Actium. To do justice to his idea Virgil enters into rivalry with a greater poet than those whom he had equalled or surpassed in his previous works. And,
though he cannot unravel before us the page of heroic action with the power and majesty of Homer, yet by the sympathy with which he realizes the idea of Rome, and by the power with which he has used the details of tradition, of local scenes, of religious usage, to embody it, he has built up in the form of an epic the most enduring and the most artistically constructed monument of national grandeur.

The second great poet of the time—Q. Horatius Flaccus or Horace (68–8) is both the realist and the idealist of his age. If we want to know the actual lives, manners and ways of thinking of the Romans of the generation succeeding the overthrow of the republic it is in the Satires and partially in the Epistles of Horace that we shall find them. If we ask what that time provided to stir the fancy and move the mood of imaginative reflection, it is in the lyrical poems of Horace that we shall find the most varied and trustworthy answer. His literary activity extends over about thirty years and naturally divides itself into three periods, each marked by a distinct character. The first—extending from about 40 to 29—is that of the Epodes and Satires. In the former he imitates the Greek poet Archilochus, but takes his subjects from the men, women and incidents of the day. Personality is the essence of his Epodes; in the Satires it is used merely as illustrative of general tendencies. In the Satires we find realistic pictures of social life, and the conduct and opinions of the world submitted to the standard of good feeling and common sense. The style of the Epodes is pointed and epigrammatic, that of the Satires natural and familiar. The hexameter no longer, as in Lucilius, moves awkwardly as if in fetters, but, like the language of Terence, of Catullus in his lighter pieces, of Cicero in his letters to Atticus, adapts itself to the everyday intercourse of life. The next period is the meridian of his genius, the time of his greatest lyrical inspiration, which he himself associates with the peace and leisure secured to him by his Sabine farm. The life of pleasure which he had lived in his youth comes back to him, not as it was in its actual distractions and disappointments, but in the idealizing light of meditative retrospect. He had not only become reconciled to the new order of things, but was moved by his intimate friendship with Maecenas to aid in raising the world to sympathy with the imperial rule through the medium of his lyrical inspiration, as Virgil had through the glory of his epic art. With the completion of the three books of Odes he cast aside for a time the office of the rates, and resumed that of the critical spectator of human life, but in the spirit of a moralist rather than a satirist. He feels the increasing languor of the time as well as the languor of advancing years, and seeks to encourage younger men to take up the role of lyrical poetry, while he devotes himself to the contemplation of the true art of living. Self-culture rather than the fulfillment of public or social duty, as in the moral teaching of Cicero, is the aim of his teaching; and in this we recognize the influence of the empire in throwing the individual back on himself. As Cicero tones down his oratory in his moral treatises, so Horace tones down the fervour of his bitter utterances in his Epistles, and thus produces a style combining the ease of the best epistolary style with the grace and concentration of poetry—the style, as it has been called, of “idealized common sense,” that of the urbanus and cultivated man of the world who is also in his hours of inspiration a genuine poet. In the last ten years of his life Horace resumed his lyrical function for a time, under pressure of the imperial command, and produced some of the most exquisite and mature products of his art. But his chief activity is devoted to criticism. He first vindicates the domination of the Augustan age to literary pre-eminence, and then seeks to stimulate the younger writers of the period to follow the regular, as the manlier forms of poetry, and especially to the tragic drama, which seemed for a short time to give promise of an artistic revival.

But the poetry of the latter half of the Augustan age destined to survive did not follow the lines either of lyrical or of dramatic art marked out by Horace. The latest form of poetry adopted from Greece and destined to gain and permanently to hold the ear of the world was the elegy. From the time of Mimnermus this form seems to have presented itself as the most natural vehicle for the poetry of pleasure in an age of luxury, refinement and incipient decay. Its facile flow and rhythm seem to adapt it to the expression and illustration of personal feeling. It goes to the mind of the reader through a medium of sentiment rather than of continuous thought or imaginative illustration. The greatest masters of this kind of poetry are the elegiac poets of the Augustan age—Tibullus, Propertius and Ovid.

Of the ill-fated C. Cornelius Gallus, their predecessor, we have but a single pentameter remaining. Of the three Tibullus (c. 54–19) is the most refined and tender. As the poet of love he gives utterance to the pensive melancholy rather than to the pleasures associated with it. In his sympathy with the life and beliefs of the country people he shows an affinity both to the idyllic spirit and to the piety of Virgil. There is something, too, in his fastidious refinement and in his shrinking from the rough contact of life that reminds us of the English poet Gray.

A poet of more strength and more powerful imagination, but of less refinement in his life and less exquisite taste in his art, is Sextus Propertius (c. 50–c. 15). His youth was a more stormy one than that of Tibullus, and was passed, not like his, among the “healthy woods” of his country estate, but amid all the licence of the capital. His passion for Cynthia, the theme of his most finished poetry, is second only in interest to that of Catullus for Lesbia; and Cynthia in her fascination and caprices seems a more real and intelligible personage than the idealized object first of the idolatry and afterwards of the maltreatment of Catullus. Propertius is a less accomplished artist and a less equably pleasing writer than either Tibullus or Ovid, but he shows more power of dealing gravely with a great or tragic situation than either of them, and his conception and rhythm give frequent proof of an intense and passionate feeling of conception and a corresponding movement of imaginative feeling which remind us of Lucretius.

The most facile and brilliant of the elegiac poets and the least serious in tone and spirit is P. Ovidius Naso or Ovid (43 B.C.—A.D. 18). As an amatory poet he is the poet of pleasure and intrigue rather than of tender sentiment or absorbing passion. Though he treated his subject in relation to himself with more levity and irony than real feeling, yet by his sparkling wit and fancy he created a literature of sentiment and adventure adapted to amuse the idle and luxurious society of which the elder Julia was the centre. His power of continuous narrative is best seen in the Metamorphoses, written in hexameters to which he has imparted a rapidity and precision of movement more suited to romantic and picturesque narrative than the weighty self-restrained verse of Virgil. In his Fasti he treats a subject of national interest; it is not, however, through the strength of Roman sentiment but through the power of vividly conceiving and narrating stories of stories of human interest that the poem lives. In his latest works—the Tristia and Ex Ponto—he imparts the interest of personal confessions to the record of a unique experience. Latin poetry is more rich in the expression of personal feeling than of dramatic realism. In Ovid we have both. We know him in the intense liveliness of his feeling and the human weakness of his nature more intimately than any other writer of antiquity, except perhaps Cicero. As Virgil marks the point of maturest excellence in poetic diction and rhythm, Ovid marks that of the greatest facility.

The Augustan age was one of those great eras in the world like the era succeeding the Persian War in Greece, the Elizabethan age in England, and the beginning of the 19th century in Europe, in which what seems a new spring of national and individual life calls out an idealizing retrospect of the past. As the present seems full of new life, the past seems rich in glory and the future in hope. The past of Rome had always a peculiar fascination for Roman writers. Virgil in a supreme degree, and Horace, Propertius and Ovid in a less degree, had expressed in their poetry the romance of the past. But it was in the great historical work of T. Livius or Livy (59 B.C.—A.D. 17) that the record of the national life received its
most systematic exposition. Its execution was the work of a life prolonged through the languor of dissolution following so soon upon the promise of the new era, during which time the past became glorified by contrast with the disheartening aspect of the present. The value of the work consists not in any power of critical investigation or weighing of historical evidence but in the intense sympathy of the writer with the national ideal, and the vivid imagination with which under the influence of this sympathy he gives life to the events and personages, the wars and political struggles, of times remote from his own. He makes us feel more than any one the majesty of the Roman state, of its great magistracies, and of the august council by which its policy was guided. And, while he makes the words sententiae populi etque Romanus full of significance for all times, no one realizes with more enthusiasm all that is implied in the words imperium Romanum, and the great military qualities of head and heart by which that empire was acquired and maintained. The vast scale on which the work was conceived and the thoroughness of artistic execution with which the details are finished are characteristically Roman. The prose style of Rome, as a vehicle for the continuous narration of events coloured by a rich and picturesque imagination and instinct with dignified emotion, attained its perfection in Livy.

Fourth Period: The Silver Age, from a.d. 17 to about 130.

For more than a century after the death of Augustus Roman literature continues to flow in the old channels. Though drawing from the provinces, Rome remains the centre of the literary movement. The characteristics of the great writers are essentially national, not provincial nor cosmopolitan. In prose the old forms—oratory, history, the epistle, treatises or dialogues on ethical and literary questions—continue to be cultivated. Scientific and practical subjects, such as natural history, architecture, medicine, agriculture, are treated in more elaborate literary style. The old Roman satura is developed into something like the modern prose novel. In the various provinces of poetry, while there is little novelty or inspiration, there is abundance of industry and ambitious effort. The national love of blank verse compass shows itself in the production of long epic poems, both of the historic and of the imitative Alexandrian type. The imitative and rhetorical tastes of Rome showed themselves in the composition of exotic tragedies, as remote in spirit and character from Greek as from Roman life, of which the only extant specimens are those attributed to the younger Seneca. The composition of didactic, lyrical and elegiac poetry also was the accomplishment and pastime of an educated dilettante class, the only extant specimens of any interest being some of the Silvae of Statius. The only voice with which the poet of this age can express himself with force and sincerity is that of satire and satiric epigram. We find now only imitative echoes of the old music created by Virgil and others, as in Statius, or powerful declamation, as in Lucan and Juvenal. There is a deterioration in the diction as well as in the music of poetry. The elaborate literary culture of the Augustan age has done nothing to impair the native force of the Latin idiom. The language of literature, in the most elaborate kind of prose as well as poetry, loses all ring of popular speech. The old oratorical tastes and aptitudes find their outlet in public recitations and the practice of declamation. Forced and distorted expression, exaggerated emphasis, point and antithesis, an affected prettiness, are studied with the view of gaining the applause of audiences who throned the lecture and recitation rooms in search of temporary excitement. Education is more widely diffused, but is less thorough, less liberal in its method, derived less than before from the purer sources of culture. The precocious immaturity of Lucan’s career affords a marked contrast to the long preparation of Virgil and Horace for their high office. Although there are some works of this so-called Silver Age of considerable and one at least of supreme interest, from the insight they afford into the experience of a century of organized despotism and its effect on the spiritual life of the ancient world, it cannot be doubted that the steady literary decline which characterized the last centuries of Augustus was beginning before the death of Ovid and Livy.

The influences which had inspired republican and Augustan literature were the artistic impulse derived from a familiarity with the great works of Greek genius, becoming more intimate with every new generation, the spell of Rome over the imagination of the kindred Italian races, the charm of Italy, and the vivid sensibility of the Italian temperament. These influences were certainly much less operative in the first century of the empire. The imitative impulse, which had much of the character of a creative impulse, and had resulted in the appropriation of the forms of poetry suited to the Roman and Italian character and of the metres suited to the genius of the Latin language, no longer stimulated to artistic effort. The great sources of Greek poetry were no longer regarded, as they were by Lucretius and Virgil, as sacred, untasted springs, to be approached in a spirit of enthusiasm tempered with reverence. We have the testimony of two men of shrewd common sense and masculine understanding—Martial and Juvenal—to the state and lifeless character of the art of the Silver Age, which sought to reproduce in the form of these charades and elegies the bright fancies of the Greek mythology.

The idea of Rome, owing to the antagonism between the policy of the government and the sympathies of the class by which literature was favoured and cultivated, could no longer be an inspiring motive, as it had been in the literature of the republic and of the Augustan age. The spirit of Rome appears only as animating the protest of Lucan, the satire of Persius and Juvenal, the sombre picture which Tacitus paints of the annals of the empire. Oratory is no longer an independent voice appealing to sentiments of Roman dignity, but the weapon of the “informers” (delatores), wielded for their own advancement and the destruction of that class which, even in their degeneracy, retained most sympathy with the national traditions. Roman history was no longer a record of national glory, stimulating the patriotism and flattering the pride of all Roman citizens, but a personal eulogy or a personal invective, according as servility to a present or hatred of a recent ruler was the motive which animated it. The charm of Italian scenes still remained the same, but the fresh and inspiring feeling of nature gave place to the more sensuous gratification derived from the luxurious and artificial beauty of the country villa. The idealizing poetry of passion, which found a genuine voice in Catullus and the elegiac poets, could not prolong itself through the exhausting licence of successive generations. The vigorous vital energy which gives interest to the personality of Catullus, Propertius and Ovid no longer characterizes their successors. The pathos of natural affection is occasionally recognized in Statius and more rarely in Martial, but it has not the depth of tenderness found in Lucretius and Virgil. The wealth and luxury of successive generations, the monotonous routine of life, the separation of the educated class from the higher work of the world, have produced their emervating and paralysing effect on the main springs of poetic and imaginative feeling.

New elements, however, appear in the literature of this period. As the result of the liberation from the active interests of life, a new interest is awakened in the inner life of the individual. The immorality of Roman society not only affords abundant material to the satirist, but deepens the consciousness of moral evil in purer and more thoughtful minds. To these causes we attribute the pathological observation of Seneca and Tacitus, the new sense of purity in Persius called out by contrast with the impurity around him, the glowing if somewhat sensational exaggeration of Juvenal, the vivid characterization of Martial. The literature of no time presents so powerfully the contrast between moral good and evil. In this respect it is truly representative of the life of the age. Another new element is the influence of a new race. In the two preceding periods the rapid diffusion of literary culture following the Social War and the first Civil War was seen to awaken into new life the elements of original genius in Italy and Cisalpine Gaul. In the first century of the empire a similar
result was produced by the diffusion of that culture in the Latinized districts of Spain. The fervid temperament of a fresh and vigorous race, which received the Latin discipline just as Latium had two or three centuries previously received the Greek discipline, revealed itself in the writings of the Senecas, Lucan, Quintilian, Martial and others, who in their own time added literary distinction to the Spanish towns from which they came. The new extraneous element introduced into Roman literature draws into greater prominence the characteristics of the last great representatives of the genuine Roman and Italian spirit—the historian Tacitus and the satirist Juvenal.

On the whole this century shows, in form, language and substance, the signs of literary decay. But it is still capable of producing men of original force; it still maintains the traditions of a happier time; it is still alive to the value of literary culture, and endeavours by minute attention to style to produce new effects. Though it was not one of the great eras in the annals of literature, yet the century which produced Martial, Juvenal and Tacitus cannot be pronounced barren in literary originality, nor that which produced Seneca and Quintilian devoid of culture and literary taste.

The Flavian period is itself subdivided into three divisions: (1) from the accession of Tiberius to the death of Nero, 68—the most important part of it being the Neronian age, 54 to 68; (2) the Flavian era, from the death of Nero to the death of Domitian, 96; (3) the reigns of Nerva and Trajan and part of the reign of Hadrian.

1. For a generation after the death of Augustus no new original literary force appeared. The later poetry of the Augustan age had ended in trilling dilettantism, for the continuance of which the atmosphere of the court was no longer favourable. The class by which literature was encouraged had become both enervated and terrorized. The most remarkable poetical product of the time is the long-neglected astrological poem of Manlius which was written at the beginning of Tiberius's reign. Its vigour and originality have had scanty justice done to them owing to the difficulty of the subject-matter and the style, and the corruptions which still disfigure its text. Very different has been the fate of the *Fables* of Phaedrus. This slight work of a Macedonian freedman, destitute of national significance and representative in its morality only of the spirit of cosmopolitan individualism, owes its vogue to its easy Latinity and popular subject-matter. Of the prose writers C. Velleius Paterculus, the historian, and Valerius Maximus, the collector of anecdotes, are the most important. A. Cornelius Celsus composed a series of technical handbooks, one of which, upon medicine, has survived. Its purity of style and the fact that it was long a standard work entitle it to a mention here. The traditional culture was still, however, maintained, and the age was rich in grammarians and rhetoricians. The new profession of the *delator* must have given a stimulus to oratory. A high idea of culture, literary as well as practical, was realized in Germanicus, which seems to have been transmitted to his daughter Agrippina, whose patronage of Seneca had important results in the next generation. The reign of Claudius was a time in which antiquarian learning, grammatical studies, and jurisprudence were cultivated, but no important additions were made to literature. A fresh impulse was given to letters on the accession of Nero, and this was partly due to the taste and artistic taste of the young emperor. Four writers of the Neronian age still possess considerable interest,—L. Annaeus Seneca, M. Annaeus Lucanus, A. Persius Flaccus and Petronius Arbiter. The first three represent the spirit of their age by exhibiting the power of the Stoic philosophy as a moral, political and religious force; the last is the most cynical exponent of the depravity of the time. Seneca (c. 5 B.C.—A.D. 65) is less than Persius a pure Stoic, and more of a moralist and pathological observer of man's inner life. He makes the commonplace of a cosmopolitan philosophy interesting by his abundant illustration drawn from the private and social life of his contemporaries. He has knowledge of the world, the suppleness of a courtier, Spanish vivacity, and the *ingenium amoenum* attributed to him by Tacitus, the fruit of which is sometimes seen in the "honeyed phrases" mentioned by Petronius—pure product of the Stoicism—of Stoicism that had found in a contemporary, Thrasea, a more rational and practical hero than Cato. But no important writer of antiquity has less literary charm than Persius. In avoiding the literary conceits and fopperies which he satirizes he has recourse to the most unnatural contortions of expression. Of hardly greater length are the seven eclogues of T. Calpurinus Siculo, written at the beginning of the reign of Nero, which are not without grace and facility of diction. Of the works of those two eras one that which from a human point of view is perhaps the most desirable in ancient literature is the most genuine literary quality, the fragment of a prose novel—the *Satyricon* of Petronius (d. 66). It is most sincere in its representation, least artificial in diction, most penetrating in its satire, most just in its criticism of art and style.

2. A greater sobriety of tone was introduced both into life and literature with the accession of Vespasian. The time was, however, characterized rather by good sense and industry than by original genius. Under Vespasian C. Plinius Secundus, or Pliny the elder (compiler of the *Natural History*, an encyclopaedic treatise, 23–79), is the most important prose writer, and C. Valerius Flaccus Setinius Balbus, author of the *Argonautica* (d. 90), the most important among the writers of poetry. The reign of Domitian, although it silenced the more independent spirits of the time, Tacitus and Juvenal, witnessed more important contributions to Roman literature than any age since the Augustan, among them the *Institutes* of Quintilian, the *Panic War* of Silius Italicus, the epics and the *Silvae* of Statius, and the *Epigrams* of Martial. M. Fabius Fujianus and A. Quintilianus are the.copyists of the last quarter of the 1st cent. forward by Juvenal as a unique instance of a thoroughly successful man of letters, of one not belonging by birth to the rich or official class, who had risen to wealth and honours through literature. He was well adapted to his time by his good sense and sobriety of judgment. His criticism is just and true rather than subtle or ingenious, and has thus stood the test of the judgment of after-times. The poem of Ti. Catus Silius Italicus (25–101) is a proof of the industry and literary ambition of members of the rich official class. Of the epic poets of the Silver Age P. Papinius Statius (c. 45–96) shows the greatest technical skill and the richest pictorial fancy in the execution of detail; but his epics have no true inspiring motive, and, although the recitation of the *Thebaid* could attract and charm an audience in the days of Juvenal, it really belongs to the class of poems so unsparingly condemned both by him and Martial. In the *Silvae*, though many of them have little root in the deeper feelings of human nature, we find occasionally more than in any poetry after the Augustan age something of the pure charming and noble life of Statius and in the epics and tragedies of the time, nor in the cultivated criticism of Quintilian that the age of Domitian lives for us. It is in the *Epigrams* of M. Valerius Martinus or Martial (c. 41–104) that we have a true image of the average sensual frivolous life of Rome at the end of the 1st century, seen through a medium of wit and humour, but undistorted by the exaggeration which moral indignation and the love of effect add to the representation of Juvenal. Martial represents his age in his *Epigrams*, as Horace does his in his *Satires* and *Odes*, with more variety and incisive force in his sketches, though with much less poetic charm and serious meaning. We know the daily life, the familiar personages, the outward aspect of Rome in the age of Domitian
better than at any other period of Roman history, and this knowledge we owe to Martial.

3. But it was under Nerva and Trajan that the greatest and most truly representative works of the empire were written. The Annals and Histories of Cornelius Tacitus (54–110), with the supplementary Life of Agricola and the Germania, and the Satires of D. Iunius Juvenalis or Juvenal (c. 47–130), sum up for posterity the moral experience of the Roman world from the accession of Tiberius to the death of Domitian. The generous scorn and pathos of the historian acting on extraordinary gifts of imaginative insight and characterization, and the fierce indignation of the satirist finding its vent in exaggerating realism, doubtless to some extent warped their impressions; nevertheless their works are the last voices expressive of the freedom and manly virtue of the ancient world. In them alone among the writers of the empire the spirit of the Roman republic seems to revive. The Letters of C. Plinius Caecilius Secundus or Pliny the Younger (61–c. 113), though they do not contradict the representation of Tacitus and Juvenal regarded as an exposure of the political degradation and moral corruption of prominent individuals and classes, do much to modify the pervadingly tragic and sombre character of their representation.

With the death of Juvenal, the most important part of whose activity falls in the reign of Trajan, Latin literature as an original and national expression of the experience, character, and sentiment of the Roman state and empire, as well as of the great literatures of the world, may be considered closed.

Later Writers.

What remains to describe is little but death and decay. Poetry died first; the paucity of writings in verse is matched by their insignificance. For two centuries after Juvenal there are no names but those of Q. Serenus Sammonicus, with his pharmacopoeia in verse (c. 225), and M. Aurelius Olympius Nemesianus, who wrote a few feeble eclogues and (283) a dull piece on the training of dogs for the chase. Towards the middle of the 4th century we have Decimus Magnus Ausonius, a professor of Bordeaux and afterwards consul (379), whose style is as little like that of classical poetry as is his prose. His Mosella, a detailed description of the river Moselle, is the least unattractive of his works. A little better is his contemporary, Rufius Festus Avienus, who made some free translations of astronomical and geographical poets; in Greek. As a Latin writer, in what may be called the expiring effort of Latin poetry, appeared the prose writers of much greater merit. The first is Claudius Claudianus (c. 400), a native of Alexandria and the court poet of the emperor Honorius and his minister Stilicho. Claudian may be properly styled the last of the poets of Rome.

Claudian.

He breathed the old national spirit, and his mastery of classical idiom and versification is for his age extraordinary. Something of the same may be seen in Rutilius Namatianus, a Gaul by birth, who wrote in 416 a description of his voyage from the capital to his native land, which contains the most glowing eulogy of Rome ever penned by an ancient hand. Of the Christian "poets" only Aurelius Prudentius Clemens (c. 348–410) need be mentioned. He was well read in the ancient literature; but the task of embodying the Christian spirit in the classical form was one far beyond his powers.

The vitality of the prose literature was not much greater though its complete extinction was from the nature of the case impossible.

The most important writer in the age succeeding Suetonius:—Juvenal was the biographer C. Suetonius Tranquillus (c. 75–160), whose work is more valuable for its matter than its manner. His style is simple and direct, but has hardly any other merit. A little later the rise of M. Cornelius Fronto (c. 100–175), a native of Cirta, marks the beginning of an African influence. Fronto, a distinguished orator and intimate friend of the emperor M. Aurelius, broke away from the traditional Latin of the Silver and Golden ages, and took as his models the pre-classical authors. The reaction was shortlived; but the same affectation of antiquity is seen in the writings of Apuleius, also an African, who lived a little later than Fronto and was a man of much greater natural parts. In his Metamorphoses, which were based upon a Greek original, he takes the wonderful story of the adventures of Lucius of Madara, and interweaves the famous legend of Cupid and Psyche. His bizarre and mystical style has a strange fascination for the reader; but there is nothing Roman or Italian about it. Two epitomists of previous histories may be mentioned: Justinus (of uncertain date) who abridged the history of Pompeius Trogus, an Augustan writer; and P. Annius Florus, who wrote in the reign of Hadrian a rhetorical sketch based upon Livy. The Historia Augusta, which includes the lives of the emperors from Hadrian to Numerianus (117–284), is the work of six writers, four of whom wrote under Diocletian and two under Constantine. It is a collection of personal memoirs of little historical importance, and marked by puerility and powerlessness of style. Ammianus Marcellinus (c. 330–400) had a higher conception of the historian’s function. His narrative of the years 353–378 (all that now remains) is honest and straightforward, but his diction is awkward and obscure. The last pagan prose writer who need be mentioned is Q. Aurelius Symmachus (c. 350–410), the author of some speeches and a collection of letters. All the art of his orate and courtly periods cannot disguise the fact that there was nothing new for paganism to say.

It is in Christian writers alone that we find the vigour of life. The earliest work of Christian apologists is the Octavius or Minucius Felix, a contemporary of Fronto. It is written in pure Latin and is strongly tinged by classical influence. Quite work of 'hence Tertullian,' Q. Septimius Florens Tertullianus (c. 150–230), a native of Carthage, the most vigorous of the Latin champions of the new faith. His style shows the African revolt of which we have already spoken, and in its medley of archaisms, Graecisms and Hebrews reveals the strength of the disintegrating forces at work upon the Latin language. A more commanding figure is that of Aurelius Augustinus or St Augustine (354–430), bishop of Hippo, who for comprehensiveness and dialectical power stands out in the same way as Hieronymus or St Jerome (c. 331 or 340–420), a native of Stridon in Dalmatia, does for modern-sided learning and scholarship.

The decline of literature proper was attended by an increased output of grammatical and critical studies. From the time of L. Aelius Stilo Præconinus, who was the teacher of V. Oderic, we have the first Latin grammars of any importance. The grammarians, the literary and linguistic problems at Rome. Varro under the republic, and M. Verrius Flaccus in the Augustan age, had busied themselves with lexicography and etymology. The outstanding in the 4th century by Nonius Marcellus and C. Marius Victorinus, both Africans; Aelius Donatus, the grammarian and commentator on Terence and Virgil. Flavius Sosipater, Charisius and Diomedes, and Servius, the author of a valuable commentary on Virgil. Ambrosius Macrobius Theodosius (c. 400) wrote a treatise on Cicero’s Somnium Scipionis and seven books of miscellaneous (Saturnalia); and Martianus Capella (c. 430), a native of Africa, published a compendium of the seven liberal arts, written in a mixture of prose and verse, with some literary pretensions. The last grammarians who need be named is the most widely known of all, the celebrated Priscianus, who published his text-book at Constantinople probably in the middle of the 5th century.

In jurisprudence, which may be regarded as one of the outlying regions of literature, Roman genius had had some of its greatest triumphs, and, if we take account of the "codes," was active to the end. The most distinguished of the early jurists (who
works are lost) were Q. Mucius Scaevola, who died in 52 B.C., and following him Ser. Sulpicius Rufus, who died in 41 B.C.

In the Augustan age M. Antonius Labeo and C. Aurelius Capito headed two opposing schools in jurisprudence, Labeo being an advocate of method and reform, and Capito being a conservative and empiricist. The strife, which reflects the controversy between the "analogists" and the "anomalists" in philology, continued long after their death. Salvius Julianus was entrusted by Hadrian with the task of reducing into shape the immense mass of law which had grown up in the edicts of successive praetors—thus taking the first step towards a code. Sex. Pomponius, a contemporary, wrote an important legal manual of which fragments are preserved. The most celebrated handbook, however, is the Institutiones of Gaius, who lived under Antoninus Pius—a model of what such treatises should be. The most eminent of all the Roman jurists was Aemilius Papinianus, the intimate friend of Septimius Severus; of his works only fragments remain. Other considerable writers were the prolific Domitian Ulpianus (c. 215) and Julius Paulus, his contemporary. The last juridical writer of note was Herennius Modestianus (c. 350). But even of great lawyers had it seems, the effects of their work remained and are clearly visible long after in the "codes"—the code of Theodosius (438) and the still more famous code of Justinian (529 and 533), with which is associated the name of Tribonianus.

BIBLIOGRAPHY.—The most full and satisfactory modern account of Latin literature is M. Schanz's Geschichte der römischen Literatur. The standard English is the C. Warr and W. Teuffel and L. Schwabe's History of Latin Literature. E. W. Mackall's short History of Latin Literature is full of excellent literary and aesthetic criticisms on the writers. C. Lamarr's Histoire de la littérature latine (1886, with specimens) alone deals with the writers of the republic. W. Y. Mayor's Roman Poets of the Republic and Poets of the Augustan Age, and R. Y. Tyrrell's Lectures on Latin Poetry, will also be found of service. An accurate concordance of the various Latin writers and their works, together with bibliographies, is given in J. E. Lecky's Bibliographical Guide to Latin Literature (1879), which is based on a German work by E. Hübner. See also the separate bibliographies to the articles on individual writers.

(W. Y. S.; J. P. P.)

LATINUS, in Roman legend, king of the aborigines in Latium, and eponymous hero of the Latin race. In Hesiod (Theogony, 1013) he is the son of Odysseus and Circe, and ruler of the Tyrrhenians; in Virgil, the son of Faunus and the nymph Marus. Maximus of Turin composed a national genealogy being substituted for the Hesiodic, which probably originated from a Greek source. Latinus was a shadowy personality, invented to explain the origin of Rome and its relations with Latium, and only obtained importance in later times through his legendary connexion with Aeneas and the foundation of Rome. According to Virgil (Aeneid, vii.1110), Aeneas, on landing at the mouth of the Tiber, was welcomed by Latinus, the peaceful ruler whose seat of government was Laurentum, and ultimately married his daughter Lavinia.

Other accounts of Latinus, differing considerably in detail, are to be found in the fragments of Catullus (De Res Gestis), Servius's commentary on Virgil) and in Dionysius of Halicarnassus; see further authorities in the article by J. A. Hild, in Darmenberg and Saglio, Dictionnaire des antiquités.

LATITUDE (Lat. latitude, lotus, broad), a word meaning breadth or width, hence, figuratively, freedom from restriction, but more generally used in the geographical and astronomical senses. The latitude of an object is its angular distance from the equator, measured on the curved surface of the earth. The direct measure of this distance being impracticable, it has to be determined by astronomical observations. As thus determined it is the angle between the direction of the plumb-line at the place and the plane of the equator. This is identical with the angle between the horizontal planes at the place and at the equator, and also with the elevation of the celestial pole above the horizon (see Astronomy). Latitude thus determined by the plumb-line is termed astronomical. The geocentric latitude of a place is the angle which the line from the earth's centre to the place makes with the plane of the equator. Geographical latitude, which is used in mapping, is based on the supposition that the earth is an elliptic spheroid of known compression, and is the angle which the normal to this spheroid makes with the equator. It differs from the astronomical latitude only in being corrected for local deviation of the plumb-line.

The latitude of a celestial object is the angle which the line drawn from some fixed point of reference to the object makes with the plane of the ecliptic.

Variability of Terrestrial Latitudes.—The latitude of a point on the earth's surface, as above defined, is measured from the equator. The latter is defined by the condition that its plane makes a right angle with the earth's axis of rotation. It follows that if the points in which this axis intersects the earth's surface, i.e. the poles of the earth, change their positions on the earth's surface, the position of the equator will also change, and therefore the latitudes of places will change also. About the end of the 19th century research showed that there actually was a very minute but measurable periodic change of this kind. The north and south poles, instead of being fixed points on the earth's surface, wander round within a circle about 50 ft. in diameter. The result is a variability of terrestrial latitudes generally.

To show the cause of this motion, let OQ represent a section of an oblate spheroid through its shortest axis, PP. We may consider this spheroid to be that of the earth, the ellipticity being greatly exaggerated. If in rotation around its axis of figure PP, it will rotate around the axis for an indefinite time. But instead of rotating around PP, it rotates around some other axis, RR, making a small angle, POR, with the axis of figure PP; this has been known since the time of Euler that the axis of rotation RR, if referred to the spheroid regarded as fixed, will necessarily rotate round the axis of figure PP in a period defined in the following way: If we put C= the moment of momentum of the spheroid around the axis of figure, and A= the corresponding moment of momentum around an axis passing through the equator EQ, then, calling one day the period of rotation of the earth on the spheroid, the axis RR will make a revolution around PP in a number of days represented by the formula C/(C−A). In the case of the earth, this ratio is 365.242193 or 365. It follows that the period in question is 365 days.

Up to 1800 the most careful observations and researches failed to establish the periodicity of such a rotation, though there was strong evidence of a variation of latitude. Then S. C. Chandler, from an elaborate discussion of a great number of observations, showed that there was really a variation of the latitude of the points of observation; but, instead of the period being 365 days, it was about 428 days. At first sight this period seemed to be inconsistent with dynamical theory. But a defect was soon found in the latter, the correction of which reconciled the divergence. In deriving a period of 365 days the earth is regarded as an absolutely rigid body, and no account is taken either of its elasticity or of the mobility of the ocean. A study of the figure will show that the centrifugal force round the axis RR, will act on the earth's surface, with a horizontal protrusion of the rotating earth so as to make it tend in the direction of the arrows. A slight deformation of the earth will thus result; and the axis of figure of the distorted spheroid will no longer be PP, but a line P'P'' between PP and RR. As the latter moves round, P'T' will continually follow it through the incessant change of figure produced by the change in the direction of the centrifugal force. Now the rate of motion of RR is determined by the actual figure at the moment. It is therefore less than the motion in an absolutely rigid spheroid in the proportion RP' : RP. It is found that, even though the earth were no more elastic than steel, its yielding combined with the mobility of the ocean would make this ratio about 2:3, resulting in an increase of the period by one-half, making it about 457 days. Thus this small flexibility is even
greater than that necessary to the reconciliation of observation with theory, and the earth is shown to be more rigid than steel—a conclusion long since announced by Kelvin for other reasons.

Chandler afterwards made an important addition to the subject by showing that the motion was represented by the superposition of two harmonic terms, the first having a period of about 430 days, the other of one year. The result of this superposition is a seven-year period, which makes 6 periods of the 428-day term \((2.48 \times 6 = 2.568 \text{ years, nearly})\), and 7 periods of the annual term. Near one phase of this combined period the two component motions nearly annul each other, so that the variation is then small, while at the opposite phase, 3 to 4 years later, the two motions are in the same direction and the range of variation is at its maximum. The coefficient of the 428-day term seems to be between 0.12° and 0.16°, that of the annual term between 0.06° and 0.11°. Recent observations give smaller values of both than those made between 1890 and 1900, and there is no reason to suppose either to be constant.

The present state of the theory may be summed up as follows:—

1. The fourteen-month term is an immediate result of the fact that the axes of rotation and figure of the earth do not strictly coincide, but make with each other a small angle of which the mean value is about 0.15°. If the earth remained invariable, without any motion of matter on its surface, the result of this non-coincidence would be the revolution of the one pole round the other in a circle of radius 0.15°, or about 15 ft., in a period of about 429 days. This revolution is called the Eulerian motion, after the mathematician who discovered it.

2. The mixture of causes is deposits of snow or ice slowly changing the position of the pole of figure of the earth. For example, a deposit of snow in Siberia would bring the equator of Mars nearer to Siberia and throw the pole a little way from it, while a deposit on the American continent would have the opposite effect. Owing to the approximate symmetry of the American and Asiatic continents it does not seem likely that the inequality of snowfall would produce an appreciable effect.

3. The dynamical causes are atmospheric and oceanic currents. Were these currents invariable their only effect would be that the Eulerian motion would not take exactly round the pole of figure, but round a point slightly removed from it. But, as a matter of fact, they are subject to annual variation. Hence the motion of the pole of rotation is also subject to a similar variation. The annual term in the latitude is thus accounted for.

Besides Chandler, Albrecht of Berlin has investigated the motion of the pole \(P\). The methods of the two astronomers are in some points different. Chandler has constructed empirical formulae representing the motion, with the results already given, while Albrecht has determined the motion of the pole from observation simply, without trying to represent it either by a formula or by theory. It is noteworthy that the difference between Albrecht's numerical results and Chandler's formulae is generally less than 0.03°.

We have the fluctuations in the position of the pole was fully confirmed, its importance in astronomy and geodesy led the International Geodetic Association to establish a series of stations round the globe, as nearly as possible on the same parallel of latitude, for the purpose of observing the fluctuation with a greater degree of precision than could be attained by the miscellaneous observations before available. The same stars were to be observed from month to month at each station with zenith-telescopes of similar approved construction. This secures a double observation of each component of the polar motion, from which most of the systematic errors are eliminated. The principal stations are: Carloforte, Italy; Mizusawa, Japan; Gaithersburg, Maryland; and Ukiah, California, all nearly on the same parallel of latitude, 39° 8'.

The fluctuations derived from this international work during the last seven years deviate but slightly from Chandler's formulae, though they show a markedly smaller value of the annual term. In consequence, the change in the amplitude of the fluctuation through the seven-year period is not so well marked as before 1900.

Chandler's investigations are found in a series of papers published in the Astronomical Journal, vols. xi. to xv. and xviii. "The explanation of the lengthening of the Eulerian period is found in the Monthly Notices of the Royal Astronomical Society for March 1892. Later volumes of the Astronomical Journal contain discussions of the causes which may produce the annual fluctuation. An elaborate mathematical discussion of the theory is by Vito Volterra: "Sulla permanenza del movimento terrestre," in Astronomische Nachrichten. vols. 135; also, more fully in his memoir "Sur la théorie des variations des latitudes," Acta Mathematica, vol. xxiii. The results of the international observations are discussed from time to time by Albrecht in the publications of the International Geodetic Association, and in the Astronomische Nachrichten (see also Earth, Figure of)."

LATIUM; in ancient geography, the name given to the portion of central Italy which was bounded on the N.W. by Etruria, on the S.W. by the Tyrrhenian Sea, on the S.E. by Campania, on the E. by Samnium and on the N.E. by the mountainous district inhabited by the Sabini, Aequi and Marsi. The name was, however, applied very differently at different times. Latium originally means the land of the Latini, and in this sense it comprises the whole of Italy, which alone was bounded, at first, on the N.W. by the Po, and on the S.E. by the Adriatic Sea; later, however, its extent was considerably reduced; but after the overthrow of the Latin confederacy, when the neighbouring tribes of the Rutuli, Hernici, Volsci and Aurunci, as well as the Latini properly so called, were reduced to the condition of subjects and citizens of Rome, the name of Latium was extended to comprise them all. It thus denoted the whole country from the Tiber to the mouth of the Savo, and just included the Mons Saccius, though the boundary was not very precisely fixed (see below). The change thus introduced, though already manifest in the composition of the Latin language (see below) was not formally established till the reign of Augustus, who formed this larger Latium and Campania together the first region of Italy; but it is already recognized by Strabo (v. 5, 1. p. 218), as well as by Pliny, who terms the additional territory thus incorporated Latium Adjutum, while he designates the original Latium, extending from the Tiber to Circei, as Latium Antiquum.

1. LATIUM ANTIQUUM consisted principally of an extensive plain, now known as the Campagna di Roma, bounded towards the interior by the Apennines, which rise very abruptly from the plains to a height of between 4000 and 3000 ft. Several of the Latin cities, including Tibur and Praeneste, were situated on the terrace-like underfalls of these mountains, while Cora, Norba and Setia were placed in like manner on the slopes of the Volscian mountains (Monti Lepini), a rugged and lofty limestone range, which runs parallel to the main mass of the Apennines, being separated from them, however, by the valley of the Trebius (Sacco), and forms a continuous barrier from there to Terracina.

Earthquakes (not of a violent character within recent centuries, though the ruin of the Colossus is probably to be ascribed to this cause) are not unknown even at the present day in Rome and in the Alban Hills, and a seismograph has been established at Rocca di Papa. The surface is by no means a uniform plain, but is a broad undulating tract, furrowed through by numerous depressions, with precipitous banks, serving as water-courses, though rarely traversed by any considerable stream. As the general level of the plain rises gradually, though almost imperceptibly, to the foot of the Apennines, these channels by degrees assume the character of ravines of a formidable description.

1. Latium, from the same root as Lūtus, side; later, brick, nārīs, flat; Sans. prātha: not connected with lūtus, whole.

2. In the time of Augustus the boundary of Latium extended as far as Treba (Trevi), 12 m. S.E. of Sublauquem (Subiaco).
Four main periods may be distinguished in the geological history of Rome and the surrounding district. The hills on the right bank of the Tiber culminating in Monte Mario (455 ft.) belong to the first of these, being of the Pliocene formation; they consist of alluvial deposits (clays and gravels) and covered almost entirely with marshes. The clay has supplied the material for brick-making, and the valleys which now separate the different summits (Janiculum, Vatican, Monte Mario) are in considerable measure artificial. On the left bank, these hills have been paralleled at a lower level, at the foot of the Pincian Hill, while in the Campagna it has been found to extend below the later volcanic formations. The latter may be divided into two groups, corresponding to the second and third periods of the Tertiary. The first of these three periods, which are now variously called the Cenozoic, began 60 million years ago. The second and third periods, in the Campagna, are the last of the Cenozoic or the recent volcanic age. By means of this drainage system, streams and rivers were already present at this time, but no lake existed. The deep valleys, drained by the Anio and its headwaters, are the result of geological processes which have affected the Campagna at various epochs. The Tiber, a river of the Aegean system, is almost certainly of Greek origin and in origin is a tributary of the river Anio. It was already a river in classical times, and it is probable that it was already a navigable river, at least from Rome to the plain of Albano and from there to the lake of Nemi. The Tiber is a natural boundary for the nomenclature of Roman antiquity, and the Tiberine hills are an important guide to the period and the limits of Roman expansion.

The third period of the Tertiary, the Neogene, is characterized by the presence of volcanic rocks, mainly in the Campagna. The Campagna area is thus a region of volcanic rocks, and the Tiber is a natural boundary for the nomenclature of Roman antiquity. The Tiberine hills are an important guide to the period and the limits of Roman expansion.

Gravity.

The Campagna area is characterized by the presence of volcanic rocks, mainly in the Campagna. The Campagna area is thus a region of volcanic rocks, and the Tiber is a natural boundary for the nomenclature of Roman antiquity. The Tiberine hills are an important guide to the period and the limits of Roman expansion.

In the Campagna area, the volcanic rocks are mainly of the peperino type, which is a tuffaceous material. These rocks are found in the Campagna area, and they were used as building material for the city of Rome. The Campagna area is thus a region of volcanic rocks, and the Tiber is a natural boundary for the nomenclature of Roman antiquity. The Tiberine hills are an important guide to the period and the limits of Roman expansion.

Drainage.

The Campagna area is characterized by the presence of volcanic rocks, mainly in the Campagna. The Campagna area is thus a region of volcanic rocks, and the Tiber is a natural boundary for the nomenclature of Roman antiquity. The Tiberine hills are an important guide to the period and the limits of Roman expansion.

LATIUM

(v. 61) is, however, of great importance. It is considered by Th. Mommsen (Roman History, i. 148) that it dates from about the 7th century B.C. which period belong the closing of the confederacy, no fresh communities being afterwards admitted to it, and the consequent fixing of the boundaries of Latium. The list is as follows: Ardeates, Arcini, Bovillani,1 Buhenantes, Cabani, Carventani, Circaei, Coriolani, Corbintes, Corni (probably Corani), Fortinei (?), Gabini, Laurentini, Lavinates, Labicani, Lanuvini, Nomentini, Norbani, Praenestini, Pedani, Querquetulani, Satricani, Scapini, Setini, Tellenii, Tiburtini, Tolerini, Tusculani, Veliterni.

These communities may be briefly described according to their geographical arrangement. Laurentum and Lavinium, which constitute the chief point of the history of Latio, is situated in the sandy strip near the sea-coast—the former only 8 m. S.E. of Ostia, which was from the first merely the port of Rome, and never figured as an independent city. Farther S.E. again lay Ardea, the ancient capital of the Alban, and some distance within which stood the town of Tusculum occupied one of the northern summits of the same group; while opposite to it, in a commanding position on a lofty hill, rose the town of Pontus, which became the chief town of the Latini. The name and the form of some of the hill towns, Latiaris, Cabenses, and the like, were doubtless derived from this camp.

The cities of the Latin league continued to hold general meetings or assemblies from time to time at the grove of the Aqua Gratia, a sanctuary at the foot of the Alban Hills, perhaps in a valley below Marino, while they had also a common place of worship on the summit of the Alban Mount (Monte Cavo), where stood the celebrated temple of Jupiter Latiaris.

The participation in the annual sacrifices at this sanctuary was regarded as typical of a Latin city (hence the name "prisci Latini" given to the participating peoples); and they continued to be celebrated long after the Latins had lost their independence and been incorporated in the Roman state.

We are on firmer ground in dealing with the spread of the supremacy of Rome in Latium when we take account of the foundation of new colonies and of the formation of new tribes, processes which as a rule go together. The information that we have as to the districts in which the sixteen earliest clans (tribus rusticæ)4 were settled shows us that, except along the Tiber, Rome's dominion extended hardly more than 5 m. beyond the city gates (Mommsen, History of Rome, i. 58). Thus, towards the N. and E. we find the towns of Antemnae, Fidenae, Cenia and Gabii;3 on the S.E., towards Alba, the boundaries of Roman territory was at the Fossa Florentina, the valley of the Sacco, 5 m. from Rome, where Coriolanus encamped (Livy ii. 39), and, on the S., towards Laurentum at the 6th mile, where sacrifice to Terminus was made (Ovid, Fasti, i. 681). The Ambravari were too celebrated even in Strabo's day (v. 3. p. 230) at a place called Φιστος between the 5th and 6th mile.

The identification (cf. Hübner in Pauly-Wissowa, Realencyclopädie, vi, 2223) of this locality with the grove of the Arval brothers at the 5th mile of the Via Portuensis, to the W. of Rome, and of the Ambravari with the festival celebrated by this brotherhood in May of each year, is now generally accepted. But Roman sway must either from the first, or very soon, have extended to Ostia, the port of Rome at the mouth of the Tiber: and it was as the emporium of Latium that Rome acquired her first importance.6

1 Albani, Accaianae (probably E. of Tiber), Arcienses, Abalani, Bubentani, Bolani, Cussetani (Carventani ?), Coriolani, Fidenates, Foretti (Forteini ?), Hortenses (near Corbio), Latinenses (near Rome itself), Longani, Manates, Macrales, Munieses (Castraformenses ?), Numinenses, Olivcianae, Octulani, Pedani, Poletaurinii, Querquetulani, Runcinti, Sacellantes, Sabinenses, Serens, Tullienses, Uscinenses, Vitelenses (not far from Corbio).

2 Although an earlier station of the Latini in the N. league, perhaps about 430 B.C. (Mommsen, op. cit. 445 n. 2) belongs the dedication of the grove of Diana by a duxoria Latinius, in the name of the people of Rome, Aricia, Lanuvium, Laurentum, Cora, Tiber, Suessa Pometia and Ardea. In the search of the Latium rusticum originis (Vienna, 1882) we find no traces of the sixth or at most eight of those found in the list of Dionysius, and these for the most part among the more obscure and least known of the names given by him. Many of the rest are unknown; while the more powerful cities of Aricia, Lanuvium and Tusculum, though situated immediately on the Alban Hills, are not included, and appear to have maintained a wholly independent position. This earlier league was doubtless broken up by the fall of Alba; it was probably the increasing power of the Volsci and Aequi that led to the formation of the later league, including all the more powerful cities of Latium, as well as to the alliance concluded by them with the Romans in the consulsip of Spurius Cassius (493 B.C.). Other cities of the Latin league had already (according to the traditional dates) received Latin colonies—Veltinæ (494 B.C.), Norba (492), Ardea (442), Labici (418), Circæi (393), Satricum (385), Setia (382).

3 The cities of the Latin league continued to hold general meetings or assemblies from time to time at the grove of the Aqua Gratia, a sanctuary at the foot of the Alban Hills, perhaps in a valley below Marino, while they had also a common place of worship on the summit of the Alban Mount (Monte Cavo), where stood the celebrated temple of Jupiter Latiaris.

4 The participation in the annual sacrifices at this sanctuary was regarded as typical of a Latin city (hence the name "prisci Latini" given to the participating peoples); and they continued to be celebrated long after the Latins had lost their independence and been incorporated in the Roman state.

5 We are on firmer ground in dealing with the spread of the supremacy of Rome in Latium when we take account of the foundation of new colonies and of the formation of new tribes, processes which as a rule go together. The information that we have as to the districts in which the sixteen earliest clans (tribus rusticæ) were settled shows us that, except along the Tiber, Rome's dominion extended hardly more than 5 m. beyond the city gates (Mommsen, History of Rome, i. 58). Thus, towards the N. and E. we find the towns of Antemnae, Fidenae, Cenia and Gabii; on the S.E., towards Alba, the boundaries of Roman territory was at the Fossa Pometia, the valley of the Sacco, 5 m. from Rome, where Coriolanus encamped (Livy ii. 39), and, on the S., towards Laurentum at the 6th mile, where sacrifice to Terminus was made (Ovid, Fasti, i. 681). The Ambravari were too celebrated even in Strabo's day (v. 3. p. 230) at a place called Φιστος between the 5th and 6th mile.

6 The identification (cf. Hübner in Pauly-Wissowa, Realencyclopädie, vi, 2223) of this locality with the grove of the Arval brothers at the 5th mile of the Via Portuensis, to the W. of Rome, and of the Ambravari with the festival celebrated by this brotherhood in May of each year, is now generally accepted. But Roman sway must either from the first, or very soon, have extended to Ostia, the port of Rome at the mouth of the Tiber: and it was as the emporium of Latium that Rome acquired her first importance.
Latinum

The boundary of the Ager Romanus antiquus towards the north-west is similarly fixed by the festival of the Robigalia at the 3rd milestone of the Via Claudia. Within this area fall the districts inhabited by the earliest tribes, so far as these are known to us. The tribus Papiunia was settled on the right bank of the Tiber near the sanctuary of the Arvalles, the Galeria perhaps a little farther west on the lower course of the stream now known as Galera, and the Tabia perhaps on the Cremera towards Veii. We know that the pagus Luniæ was on the Via Latina, and that the tribes Papia and Rupina dwelt between Tusculum and the city, while the territory of the Papia possibly lay nearer Tusculum, as it was to this tribe that the Roman citizens in Tusculum belonged in later days. It is possible that the Camilia was situated in the direction of Tibur, inasmuch as this town was afterwards enrolled in this tribe. The tribus Claudia, probably the last of the 6 older tribes rustice, was settled on both banks in 504 B.C. Its territory lay beyond the Anio, between Fidenae and Ficulae (Liv. ii. 16; Dion. Hal. v. 40). The locality of the pagi round which the other tribes are grouped is not known to us.

With the earliest extensions of the Roman territory coincided the first beginnings of the Roman road system. The road to Ostia may have existed from the first; but after the Latin community was confirmed in 428 B.C. and Carthage under Caius Gracchus the elder of Rome, we may well believe that the first portion of the Via Salaria, leading to Antemnae, Fidenae (the fall of which is placed by tradition in 428 B.C.) and Crustumérium, came into existence. The road is traced to the Capitoline from the vicinity of the tribus Claústunia (the only one of the earliest twenty-one tribes which bears a local name) is both a consequence of an extension of territory and of the establishment of the assembly of the plebs by tribes, for which there was inequality of the number of members desirous of admission (Mommsen, History of Rome, i. 280). The construction of the Via Salaria took its name, inasmuch as it was the route by which Sabine traders came from the interior to fetch the salt. To this period would also belong the Via Flaminia, leading to Ficulæ, and afterwards to Collatiæ, and the Via Collatina, which was afterwards called to Collatiæ. Gabii became Roman in fairly early times, though at what period is uncertain, and with its subjugation must have originated the Via Gabina, afterwards prolonged to Praeneste. The Via Latina too must be of very early origin; and tradition places the foundation of the Latin colony at Signia (to which it led) as early as 405 B.C. Not long after the capture of Fidenæ, the main outlet of Veii, the chief city itself fell (396 B.C.) and a road (still traceable) was thrown down leading from Tusculum to the Via Caselle in early times, inasmuch as we hear of the flight of the Vestales thither in 380 B.C. The origin of the rest of the roads is no doubt to be connected with the gradual establishment of the Latin league. We need only add with the later (long distance) roads and the name of their constructor, all the short distance roads on the left bank of the Tiber bear the names of towns which belonged to the league—Nomentum, Tibur, Praeneste, Labici, Ardea, Laurentum which guided to Collatia, and the Capitoline road leading to Pedum, is known to us only from an inscription (Bull. Soc. Antiquaires de France, 1905, p. 177) discovered in Tunisia in 1908, and may be of much later origin; it was a branch of the Via Praenestina.

There must also have been a road, along the line of the later Via Appia, to Bovillae, Aricia, Lanuvium and Velitrae, going thence to Cuta, Norba and Setia along the foot of the Volscanian Mountains; while nameless roads, which can still be traced, led direct from Rome to Sutrium and Falernum. We can therefore trace the advance of the Roman supremacy with greater ease after 387 B.C. Inasmuch as this year (adopting the traditional dating for what it is worth) 299 B.C. every accession of territory is marked by the foundation of a group of new tribes; the limit of 35 in all was reached in the latter year. In 387, after the departure of the Gauls, southern Etruria was conquered, and four new tribes were formed: Arminis (probably derived from Aro, mod. Arrone)—though the ancient name does not occur in literature—the stream which forms the outlet to the lake of Bracciano, anc. Locus Sabatinus,2 Sabatina (called after this lake), Stelatina (named from the Campus Stellatus, near Capena; cf. Festus p. 343. Mlll.) and Trentorena (which, Festus tells us, was so called from the ancient name is known from an inscription discovered in 1888.

1 So Kubitschek in Pauly-Wissowa, Realencyclopädie, ii. 1204.

2 Aymonin, Landmarkstr.: 111, § 22. The Sabatina formed a part of the area of the city of Bovillae, and doubtless the Sabatina could not be the name of a tribe in Latin but only a primordial name.

3 For the long distance roads, see Mommsen, History of Rome, 1911, ii. 182 ff.

4 Festus tells us (p. 156 Mlll.) that the Maecia derived its name "quae dominii Martis" from the Roman city of Maecia (now called Maccio) which was the only part of the Latin league that gave its name to a tribe.

5 Festus tells us (p. 156 Mlll.) that the Maecia derived its name "quae dominii Martis" from the Roman city of Maecia (now called Maccio) which was the only part of the Latin league that gave its name to a tribe.

6 See Flaminia, Via and Valeria, Via.

7 L. Caetani indeed (Nineteenth Century and After, 1908) attributes the economic decadence of the Roman Campania to the existence of free trade throughout the Roman empire.
speaks of Gabii, Labici and Bovillae as places that had fallen into abject poverty, while Horace refers to Gabii and Fidenae as mere "deserted villages," and Strabo as "once fortified towns, but now villages, belonging to private individuals." Many of the smaller places mentioned in the list of Dionysius, or the early wars of the Romans, had altogether ceased to exist, but the statement of Pliny that fifty-three communities (populi) had thus perished within the boundaries of Old Latium is perhaps exaggerated. By the end of the Republic a good many parts of Latium were infected, and Rome itself was highly malarious in the warm months (see W. H. S. Jones in Annals of Archaeology and Anthropology, ii. 97, Liverpool, 1909). The emperors Claudius, Nerva and Trajan turned their attention to the district, and under their example and exhortation the Roman aristocracy erected numerous villas, which were surrounded by their own private roads and bourned them at least for summer residences. During the 2nd century the Campagna seems to have entered on a new era of prosperity. The system of roads radiating in all directions from Rome (see ITALY: History, § B) belonged to a much earlier period; but they were connected by a network of crossroads (now mostly abandoned, while the main lines are still almost all in use) leading to the very numerous villas with which the Campagna was strewed (even in districts which till recently were devastated by malaria), and which seem in large measure to belong to this period. Some of these are of enormous extent, e.g. the villa of the Quintilli on the Via Appia, that known as Setta Bassi on the Via Latina, and that of Hadrian near Tibur, the largest of all.

When the land tax was introduced into Italy in 292, the first region of Apulia and various towns in Provence Campania. Later on the name Latium entirely disappeared, and the name Campania extended as far as Vii and the Via Aurelia, whence the medieval and modern name Campagna di Roma. The donation made by Constantine to various churches of Rome of numerous estates belonging to the patrimonium Caesaris in the neighbourhood of Rome was of great historical importance, as being the origin of the territorial dominion of the popacy. His example was followed by others, so that the church property in the Campagna soon became considerable; and, owing to the immunities and privileges which it enjoyed, a certain revival of prosperity ensued. The invasions of the barbarian hordes did great harm, but the formation of centres (domuscolae) in the 8th and 9th centuries was a fact of great importance: the region was again inhabited and the marshes were again covered with trees. Smaller centres (the colonia—often formed in the remains of an ancient villa—the curtil or curia, the castrum, the casale) grew up later. We may note that, owing to the growth of the temporal power of the popes, there was never a dux Romae dependent on the exarchate of Ravenna, similar to those established by Narses in the other districts of Italy.

The papal influence was also retained by means of the suburban bishoprics, which took their rise as early as the 4th and 5th centuries. The rise of the democratic commune of Rome 1 about 1143 and of the various trade corporations which we already find in the early 11th century led to struggles with the papacy; the commune of Rome made various attempts to exercise supremacy in the Campagna, and although the wine-growing of the region reached its height in the 15th. The commune also tried to restrict the power of the barons, who, in the 13th century especially, though we find them feudatories of the holy see from the 10th century onwards, threatened to become masters of the whole territory, which is still dotted over with the baronial castles and lofty solitary towers of the rival families of Rome—Orsini, Colonna, Savelli, Conti, Caetani—who ruthlessly destroyed the remains of earlier edifices to obtain materials for their own, and whose castles, often placed upon the high roads, thus following a strategic line to a stronghold in the country, did not contribute to the undisturbed security of traffic upon them, but rather led to their abandonment. On a list of the inhabited centres of the Campagna of the 14th century with the amount of salt (which was a monopoly of the commune of Rome) consumed by each, Tomassetti bases an estimate of the population: this was about equal to that of our own times, but differently distributed, some of the smaller centres having disappeared at the expense of the towns. Several of the popes, as Sixtus IV. and Julius III., made unsuccessful attempts to improve the condition of the Campagna, the former making a serious attempt to revive agriculture as against pasture, while in the latter part of the 16th century a line of watch-towers was erected along the coast. In the Renaissance, it is true, the erection of many fine villas in the neighbourhood of Rome—not only in the hills round the Campagna, but even in certain places in the lower ground, e.g. those of Julius II. at La Magliana and of Cardinal Trivulzio at Salone—and these continued to be frequented as summer residences, though they did not deal a fatal blow to the prosperity of the Roman nobility. The 17th and 18th centuries, however, mark the worst period of depopulation in the more malarious parts of the Campagna, which seems to have begun in the 15th century, though we hear of malaria throughout the middle ages. The most healthy portions of the territory are in the north and east, embracing the slopes of the Apennines which are watered by the Teverone and Sacco; and the most pestilential is the stretch between the Monti Lepini and the sea. The Pontine Marshes (q.v.) included in the latter division, were drained, according to the plan of Bolognini, by Pius VI., who restored the ancient Via Appia to traffic; but though they have returned to pasture and cultivation, their insalubrity is still notorious. The soil in many parts is very fertile and springs are often plentiful and abundant: the water is in some cases sulphurous or ferruginous. In summer, indeed, the vast expanses are little better than an arid steppe; but in the winter it furnishes abundant pasture to flocks of sheep from the Apennines and herds of silver-grey oxen and shaggy black horses, and sheep passing in the summer to the mountain pastures. A certain amount of horse-breeding is done, and the government has, as elsewhere in Italy, a certain number of stallions. Efforts have been made since 1882 to cure the waterlogged condition of the marshy grounds. The methods employed have been three—(i.) the cutting of drainage channels and clearing the marshes by pumping, the method principally employed; (ii.) the system of warping, i.e. directing a river so that it may deposit its silt in the middle of a flat area, and make it level, so working it up and consolidating them, and then leading the water away again by drainage; (iii.) the planting of firs and eucalyptus trees, e.g. at Tre Fontane and elsewhere. These efforts have not been without success, though it cannot be affirmed that the malarial Campagna is anything like healthy yet. The regulation of the rivers, more especially of the Tiber, is probably the most efficient method for coping with the problem. Since 1884 the Italian Government have been systematically enclosing, pumping dry, and generally draining the marshes of the Agro Romano, that is, the tracts around Ostia; the Isola Sacra, at the mouth of the Tiber; and Maccarone. Of the whole of the Campagna less than one-tenth comes annually under the plough. In its picturesque desolation, contrasting so strongly with its prosperity in Roman times, the low marshes, with their million inhabitants, and with lofty mountains in view from all parts of it, is one of the most interesting districts in the world, and has a peculiar and indefinable charm. The modern province of Rome (forming the compartimento di Lazio) includes also considerable mountain districts, extending as far N.W. as the Lake of Bolsena, and being divided on the N.E. from Umbria by the Tiber, while on the E. it includes a considerable part of the Sabine mountains and Apennines. The ancient district of the Hernicans, of which Alatri is regarded as the centre, is known as the Ciociara, from a kind of sandals (cioccare) worn by the peasants. On the S.E. too a considerable proportion of the group of the Lepini belongs to the province. The land is for the most part let by the proprietors to mercanti di Campagna, who employ a subordinate class of factors (fattori) to manage their affairs on the spot.
The recent discovery that the malaria which has hitherto rendered parts of the Campagna almost uninhabitable during the summer is propagated by the mosquito (*Anopheles claviger*) marks a new epoch; the most diverse theories as to its origin had hitherto been propounded, but it is now possible to combat it on a definite plan, by draining the marshes, protecting the houses by fine mosquito-proof wire netting (for *Anopheles* is not active by day), improving the water supply, &c., while for those who have fever, quinine (now sold cheaply by the state) is a great specific. A great improvement is already apparent; and a law carried in 1903 for the *Bonifica dell’Agro Romano* compels the proprietors within a radius of some 6 m. of Rome to cultivate their lands in a more productive way than has often hitherto been the case, exemption from taxes for ten years and loans at 2½% from the government being granted to those who carry on improvements, and those who refuse being expropriated compulsorily. The government further resolved to open roads and schools and provide twelve additional doctors. Much is done in combating against malaria by the Italian Red Cross Society. In 1900 31% of the inhabitants of the Agro Romano had been fever-stricken; since then the figure has rapidly decreased (5½% in 1905).

The wheat crop in 1906 in the Agro Romano was 8,185,500 bushels, the Indian corn 3,314,000 bushels, the wine 12,100,000 gallons and the olive oil 1,980,000 gallons,—these last two from the hill districts. The wine production had declined by one-half from the previous year, exportation having fallen off in the whole country. 1907, however, was a year of great overproduction all over Italy. The wine of the Alban hills is famous in modern as in ancient times, but will not as a rule bear exportation. The forests of the Alban hills and near the coast produce much charcoal and light timber, while the Sabine and Volscian hills have been largely deforested and are now bare limestone rocks. Much of the labour in the winter and spring is furnished by peasants who come down from the Volscian and Herculanian mountains, and from Abruzzi, and carry on the manufacture of charcoal, for which the hills are admirably adapted. There are in the Apennines, on the sea-coast between the Liris (Garigliano) and the Vulturine, at the foot of the Monte Massico, in the last town in Latium according to the official use of the term and sometimes assigned to Campania, while Suessa was more properly belonging to it, the woods along the whole lower course of the Liris, Aurunci, Sinuessa, on the sea-coast between the Liris (Garigliano) and the Vulturine, at the foot of the Monte Massico, was the last town in Latium according to the official use of the term and was sometimes assigned to Campania, while Suessa was more properly belonging to it. On the other hand, the Apennines, in the Vicinity of Suessa, which is the 100th milestone of the Via Latina—a fact which led later to the enjoyment of the Roman courts being extended on every side to the 100th mile from the city, and to this being the limit beyond which possession from Rome was considered to begin, form steep and rugged mountain masses from 4000 to 5000 ft. high. They are traversed by three principal valleys: (1) that of the Anio, now called Teverone, which descends from above Subiaco to Tivoli, where it enters the plain of the Campagna; (2) that of the Trerus (Sacro), which descends from the Sabine hills, and forms the confluence of the Tiber; (3) the Liri, which by the river Frascati, flows past the town of Sora, and has a very tortuous course from the sea at Minturnae; its lower valley is for the most part of considerable width, and forms a fertile tract of considerable extent, bounded on the north by olive-trees and oaks, and thickly studded with towns and villages.

It may be observed that, long after the Latins had ceased to exist as a separate people we meet in Roman writers with the phrase of Latium, which is not to be interpreted in the sense, commonly so-called of the Romans, who had conferred the Latin rights; (2) an inferior form of the Roman franchise, which had been granted in the first instance to certain cities of the Latins, when they became subjects of Rome, and was afterwards bestowed upon many other cities of Italy, especially the so-called Latin colonies. At a later period the same privileges were extended to places in other countries also—s—e.

LATONA (Lat. form of Gr. Ἀπρό, Leto), daughter of Coeus and Phoebe, mother of Apollo and Artemis. The chief seats of her legend are Delos and Delphi, and the generally accepted tradition is a union of the legends of these two places. Leto, pregnant by Zeus, seeks a place of refuge to be delivered. After long wandering she reaches the barren isle of Delos, which, according to Pindar ( Frag. 87, 88), was a wandering rock borne about by the waves till it was fixed to the bottom of the sea for the birth of Apollo and Artemis. In the oldest forms of the legend Hera is not mentioned; but afterwards the wanderings of Leto are ascribed to the jealousy of that goddess, enraged at her amours with Zeus. The foundation of Delphi follows immediately on the birth of the god; and on the sacred way between Tempe and Delphi the giant Tityus offers violence to Leto, and is immediately slain by the arrows of Apollo and Artemis (Odyssey, xi. 576-581; Iliadorus i. 4). Such are the main features of the traditional form of the Leto legend, which is due especially to the two Homeric hymns to Apollo. But Leto is a real goddess, not a mere mythological figure. The honour paid to her in Delphi and Delos might be explained as part of the cult of her son Apollo; but temples to her existed in Argos, in Mantinea and in Xanthus in Lycia; her sacred grove was on the coast of Crete. In Lycia graves are frequently placed under her protection, and she is also known as a goddess of fertility and as *soupopódotos*. It is to be observed that she appears far more conspicuously in the Apolline myths than in those which grew round the great centres of Artemis worship, the reason being that the idea of Apollo and Artemis as twins is one of later growth on Greek soil. Lycia, one of the chief seats of the cult of Apollo, where most frequent traces are found of the worship of Leto as the great goddess, was probably the earlier home of her religion.
LATTOUCHE—LA TOUR D’AUVERGNE

In Greek art Leto usually appears carrying her children in her arms, pursued by the dragon sent by the jealous Hera, which is slain by the infant Apollo; in vase paintings especially she is often represented with Apollo and Artemis. The statue of Leto in the Letoion at Argos was the work of Praxiteles.

LATOUCHE, HYACINTHE JOSEPH ALEXANDRE THA-BAUDE (known as Henri) (1785-1855), French poet and novelist, was born at La Châtre (Indre) on the 2nd of February 1788. Among his works may be distinguished his comedies: Projets (1811), and, in collaboration with Émile Deschamps, Sœurs de Florian (1818), which ran for a hundred nights; also La Reine d’Espagne (1831), which proved too indecent for the public taste; a novel, Fragolletta: Naples et Paris en 1790 (1829), which attained a success of notoriety; La Vallée aux coups (1833), a volume of prose essays and verse; and two volumes of poems, Les Adieux (1834) and Les Agrestes (1844).

Latouche’s chief claim to remembrance is that he revealed to the world the genius of André Chénier, only known to a limited few. The remains of the poet’s work had passed from the hands of Daunou to Latouche, who had sufficient critical insight instantly to recognize their value. In editing the first selection of Chénier’s poems (1819) he made some trifling emendations, but did not. As Béranger afterwards asserted, make radical alterations, since the work was greater than one literary fraud. He caused a licentious story of his own to be attributed to the duchesse de Duras, the irreproachable author of Ourika. He made many enemies by malicious attacks on his contemporaries.

The Constitutionnel was suppressed in 1817 by the government for an obscure political allusion in an article by Latouche. He then undertook the management of the Mercure du XIXe siècle, and began a bitter warfare against the monarchy. After 1830 he edited the Figaro, and spared neither the liberal politicians nor the romanticists who triumphed under the monarchy of July. In his turn he was violently attacked by Gustave Planche in the Recueil des deux mondes for November 1831. But it must be remembered to the credit of Latouche that he did much to encourage George Sand at the beginning of her career. The last twenty years of his life were spent in retirement at Aulnay, where he died on the 9th of March 1851.

Sainte-Beuve, in the Causeries du lundi, vol. 3, gives a not too sympathetic portrait of Latouche. See also George Sand in the Siècle for the 18th, 19th and 20th of July 1851.

LA TOUR, MAURICE QUENTIN DE (1704-1788), French pastellist, was born at St Quentin on the 5th of September 1704. After leaving Picardy for Paris in 1727 he entered the studio of Speoè—a upright man, but a poor master, rector of the academy of St Luke, who still continued, in the teeth of the Royal Academy, the traditions of the old guild of the master painters of Paris. This possibly contributed to the adoption by La Tour of a line of work foreign to that imposed by an academical training; for pastels, though occasionally used, were not a principal and distinct branch of work until 1726, when Rosalba Carriera brought them into fashion with the Parisian world. In 1737 La Tour exhibited the first of that splendid series of a hundred and fifty portraits which formed the glory of the Salon for the succeeding thirty-seven years. In 1746 he was received into the academy; and in 1751, the following year to that in which he received the title of painter to the king, he was promoted by that body to the grade of councillor. His work had the rare merit of satisfying at once both the taste of his fashionable models and the judgment of his brother artists. His art, consummate of its kind, achieved the task of flattering his sitters, whilst hiding that flattery behind the just and striking likeness which, says Pierre Jean Mariette, he hardly ever missed. His portraits of Rousseau, of Voltaire, of Louis XV., of his queen, of the dauphin and dauphine, are at once documents and masterpieces unsurpassed except by his life-size portrait of Madame de Pompadour, which, exhibited at the Salon of 1755, became the chief ornament of the cabinet of pastels in the Louvre. The museum of St Quentin also possesses a magnificent collection of works which at his death were in his own hands. La Tour retired to St Quentin at the age of 80, and there he died on the 8th of February 1788. The riches amased during his long life were freely bestowed by him in great part before his death; he founded prizes at the school of fine arts in Paris and for the town of Amiens, and endowed St Quentin with a great number of useful and charitable institutions. He never married, but lived on terms of warm affection with his brother (who survived him, and left to the town the drawings now in the museum); and his relations to Mlle Marie Fel (1713-1789), the celebrated singer, were distinguished by a strength and depth of feeling not common to the loves of the 18th century.

See, in addition to the general works on French art, C. Desmeuze, M. O. de La Tour, peintre du roi (1854); Chapeillepy, Les Peintres de la Tour (1864), and "La Tour" in the Collection des artistes célèbres (1866); E. and J. de Goncourt, La Tour (1867); Giffrey and M. Tourneux, Correspondance inédite de M. G. de La Tour (1885); Tourneux, La Tour, biographie critique (1904); and Tourneux, "M. Quentin de la Tour au musée de St Quentin" (1882).

LA TOUR D’AUVERGNE, THÉOPHILE MALO (1743-1800), French soldier, was born at Carhaix in Brittany on 23rd of December 1743, the son of an advocate named Corret. His desire for a military career being strongly marked, he was enabled, by the not uncommon device of producing a certificate of nobility signed by his friends, first to be nominally enlisted in the Maison du Roi, and soon afterwards to receive a commission in the line, under the name of Corret de Kerbaufret. Four years after joining, in 1771, he assumed by leave of the duke of Bouillon the surname of La Tour d’Auvergne, being in fact descended from an illegitimate half-brother of the great Turenne. Many years of routine service with his regiment were broken only by his participation as a volunteer in the duc de Crillon’s Franco-Spanish expedition to Minorca in 1781. This led to an offer of promotion into the Spanish army, but he refused to change his allegiance. In 1788 he was promoted captain, and in 1791 he received the cross of St Louis. In the early part of the Revolution he was Fillon’s close friend, and played a liberal opposition to the proposals of many of his brother officers in the Angoumois regiment to emigrate rather than to swear to the constitution. In 1792 his lifelong interest in numismatics and questions of language was shown by a work which he published on the Bretons. At this time he was serving under Montesquieu in the Alps, and although there was only outpost fighting he distinguished himself by his courage and audacity, qualities which were displayed in more serious fighting in the Pyrenees the next year. He declined well-earned promotion to colonel, and, being broken in health and compelled, owing to the loss of his teeth, to live on milk, he left the army in 1795. On his return by sea to Brittany he was captured by the English and held prisoner for two years. When released, he settled at Passy and published Origines gauloises, but in 1797, on the appeal of an old friend whose son had been taken as a conscript, he volunteered as the youth’s substitute, and served on the Rhine (1797) and in Switzerland (1798-1799) as a captain.

In recognition of his singular bravery and modesty Carnot obtained a decree from the first consul naming La Tour d’Auvergne “first grenadier of France” (27th of April 1800). This led him to volunteer again, and he was killed in action at Oberhausen, near Donauwörth, on the 27th of June 1800.

La Tour d’Auvergne’s almost legendary courage had cultivated the imagination of the French soldier, and his memory was not suffered to die. It was customary for the French troops and their allies of the Rhine Confederation under Napoleon to march at attention when passing his burial-place on the battlefield. His heart was long carried by the grenadier company of his regiment, the 46th; after being in the possession of Garibaldi for many years, it was finally deposited in the keeping of the city of Paris in 1883. But the most striking tribute to his memory is paid to-day as it was by order of the first consul in 1800. “His name is to be kept on the pay list and roll of his company, if it will be called at all parades and a non-commissioned officer will reply, Morted champ d’honneur.” This custom, with little variation, is still observed in the 46th regiment on all occasions when the colour is taken on parade.
LATREILLE—LATUKA

LATREILLE, PIERRE ANDRÉ (1762-1833), French naturalist, was born in humble circumstances at Brives-la-Gaillarde (Corrèze), on the 26th of November 1762. In 1778 he entered the college Lamoine at Paris, and on his admission to priestly orders in 1786 he retired to Brives, where he devoted all the leisure which the discharge of his professional duties allowed to the study of entomology. In 1788 he returned to Paris and found means of making himself known to the leading naturalists there. His "Mémoire sur les mites découvertes en France," contributed to the Proceedings of the Society of Natural History in Paris, procured for him admission to that body. At the Revolution he was compelled to quit Paris, and as a priest of conservative sympathies suffered considerable hardship, being imprisoned for some time at Bordeaux. His Précis des caractères génériques des insectes, disposés dans un ordre naturel, appeared at Brives in 1796. In 1798 he became a corresponding member of the Institute, and at the same time was entrusted with the task of arranging the entomological collection at the recently organized Muséum d'Histoire Naturelle (Jardin des Plantes); in 1814 he succeeded G. A. Olivier as member of the Académie des Sciences, and in 1821 he was made a chevalier of the Legion of Honour. For some time he acted as professor of zoology in the veterinary school at Allôe near Paris, and in 1830, when the chair of zoology of invertebrates at the Muséum was divided after the death of Lamarck, Latreille was appointed professor of zoology of crustaceans, arachnids and insects, the chair of molluscs, worms and zoophytes being assigned to H. M. D. de Blainville. "On me donne du pain quand je n'ai plus de dents," said Latreille, who was then in his sixty-eighth year. He died in Paris on the 6th of February 1833.

In addition to the works already mentioned, the numerous works of Latreille include: Histoire naturelle générale et particulière des crustacés et insectes (4 vols., 1802-1803), forming part of C. N. S. Sonini's edition of Buffon; Genera crustaceorum et insectorum, secundum ordinem naturalis in familias disposita (4 vols., 1806-1810); Genera crustaceorum & insectorum: sur l'ordre naturel des classes, composant les classes des crustacés, des arachnides, et des insectes (1810); Familles naturelles du règne animal, exposées succinctement et dans un ordre analytique (1825); Cours d'entomologie (of which only the first volume appeared, 1831); the whole of the section "Crustacés, Arachnides, Insectes," in G. Cuvier's Règne animal; besides many papers in the Annales du Muséum, the Encyclopédie méthodique, the Dictionnaire classique d'histoire naturelle and elsewhere.

LA TRÉMOUILLE, an old French family which derives its name from a village (the modern La Trémouille) in the department of Vienne. The family has been known since the middle of the 11th century, and since the 14th century its members have been conspicuous in French history. Guy, sire de la Trémouille, statesman, was tied to France, was imprisoned at the battle of Nicopolis (1396), and Georges, the favourite of King Charles VII, was captured at Agincourt (1415). Louis (2), called the chevalier sans reproche, defeated and captured the duke of Orleans at the battle of Saint-Aubin-du-Cormier (1488), distinguished himself in the wars in Italy, and was killed at Pavia (1525). In 1521 François (2) acquired a claim on the kingdom of Naples by his marriage with Anne de Laval, daughter of Charlotte of Aragon. Louis (3) became duke of Thouars in 1563, and his son Claude turned Protestant, was created a peer of France in 1595, and married a daughter of William the Silent in 1598. To this family belonged the line of the counts of Jojny, the marquises of Royan and counts of Olonne, and the marquises and dukes of Noirmoutier.

LATROBE, CHARLES JOSEPH (1801-1875), Australian explorator, was born in London on the 20th of March 1801. The Latrobes were of Huguenot extraction, and belonged to the Moravian community, of which the father and grandfather of C. J. Latrobe were ministers. His father, Christian Ignatius Latrobe (1758-1836), a musician of some note, did good service in the direction of popularizing classical music in England by his Selection of Sacred Music from the Works of the most Eminent Composers of Germany and Italy (6 vols., 1806-1825). C. J. Latrobe was an excellent mountaineer, and made some important ascents in Switzerland in 1824-1826. In 1832 he went to America with Count Albert Poutouze, and in 1834 crossed the prairies from New Orleans to Mexico with Washington Irving. In 1837 he was invested with a government commission in the West Indies, and two years later was made superintendent of the Port Phillip district of New South Wales. When Port Phillip was erected into a separate colony as Victoria in 1851, Latrobe became lieutenant-governor. The discovery of gold in that year attracted enormous numbers of immigrants annually. Latrobe discharged the difficult duties of government at this critical period with tact and success. He retired in 1854, became C. B. in 1858 and died in London on the 2nd of December 1875. Beside some volumes of travel he published a volume of poems, The Solace of Song (1857).

LATTEN (from O. Fr. laton, mod. Fr. laiton, possibly connected with Span. lato, Ital. latta, a lath), a mixed metal like brass, composed of copper and zinc, generally made in thin sheets, and used especially for monumental brasses and effigies. A fine example is in the screen of Henry VII's tomb in Westminster Abbey. There are three forms of latten, "black latten," unpolished; "white latten," of extreme thinness, and "roll latten," of the thickness either of black or shaven latten, but with both sides polished.

LATTICE LEAF PLANT, in botany, the common name for Outirella fenestrata, an aquatic monocotyledonous plant belonging to the small natural order Aponogenotaceae and a native of Madagascar. It has a singular appearance from the structure of the leaves, which are oblong in shape, from 6 to 18 in. long and from 2 to 4 in. broad; they spread horizontally beneath the surface of the water, and are reduced to little more than a lattice-like network of veins. The tuberculate roots are edible. The plant is grown in cultivation as a stooe-aquatic.

LATUDE, JEAN HENRI, often called DANNY or MASERS DE LATUDE (1725-1803), prisoner of the Bastille, was born at Montagnac in Gascony on the 23rd of March 1725. He received a military education and went to Paris in 1748 to study mathematics. He led a dissipated life and endeavoured to curry favour with the marquis de Pompadour by secretly sending her a box of poison and then informing her of the supposed plot against her life. The ruse was discovered, and Mme de Pompadour, not appreciating the humour of the situation, had Latude put in the Bastille on the 1st of May 1749. He was later transferred to Vincennes, whence he escaped in 1750. Retaken and imprisoned in the Bastille, he made a second brief escape in 1756. He was transferred to Vincennes in 1764, and the next year made a third escape and was a third time recaptured. He was put in a madhouse by Mulesherbes in 1775, and discharged in 1777 on condition that he should retire to his native town. He remained in Paris and was again imprisoned. A certain Mme Legros became interested in him through chance reading of one of his memoirs, and, by a vigorous agitation in his behalf, secured his definite release in 1784. He exploited his long captivity with considerable ability, posing as a brave officer, a son of the marquis de la Tude, and a victim of Pompadour's intrigues. He was exiled and pensioned during the Revolution, and in 1793 the convention compelled the heirs of Mme de Pompadour to pay him 60,000 francs damages. He died in obscurity at Paris on the 1st of January 1805.

The principal work of Latude is the account of his imprisonment, written in collaboration with an advocate named Thierry, and entitled Prison de Porte ouvert, ou Memoires de Henri Latude, detenu pendant trente-cinq ans dans les diverses prisons d'etat (Amsterdam, 1787, 5th ed. Paris, 1889). An Eng. trans. of a portion was published in 1787. The work is full of lies and misrepresentations, but had a great vogue at the time of the French Revolution. Latude also wrote essays on all sorts of subjects.

LATUKA, a tribe of negro stock inhabiting the mountainous country of the Congo. They have received a tinge of Hamitic blood from the Gallar people, and have high
foreheads, large eyes, straight noses and thick but not pouting lips. They are believed by Sir H. H. Johnston to be the original and purest type of the great Masai people, and are assimilated to the Nilotic negro races in customs. Like their neighbours the Bari and Shilluk tribes, they despise clothing, though the important chiefs have adopted Arab attire. Their country is fertile, and they cultivate tobacco, durra and other crops. Their villages are numerous, and some are of considerable size. Tarangole, for instance, on the Khor Kohs, has upwards of three thousand huts, and sheds for many thousands of cattle. The Latuka are industrious and especially noted for skill as smiths. Emin Pasha stated that the lion was so little dreaded by the Latuka that on one being caught in a leopard trap they hastily set it free.

LAUBN, a town of Germany in the Prussian province of Silesia, is situated in a picturesque valley, at the junction of the lines of railway from Gottitz and Sorau, 16 m. E. of the former. Pop. (1905) 14,644. Lauban has a Roman Catholic and two Evangelical churches, a town hall, dating from 1541, a conventual house of the order of St. Magdalene, dating from the 14th century, a municipal library and museum, two hospitals, an orphanage and several schools. Its industrial establishments comprise tobacco, yarn, thread, linen and woolen cloth manufacturies, bleaching and dyeing works, breweries and oil and flour mills.

Lauban was founded in the 10th and fortified in the 13th century; in 1427 and 1431 it was devastated by the Hussites, and in 1640 by the Swedes. In 1671 it was the headquarters of Frederick the Great, and in 1815 it was the last Saxon town that made its submission to Prussia.

See Berkel, Geschichte der Stadt Lauban (Lauban, 1896).

LAUBE, HEINRICH (1806-1884), German dramatist, novelist and theatre-director, was born at Sprottau in Silesia on the 18th of September 1806. He studied theology at Halle and Breslau (1826-1829), and settled in Leipzig in 1832. Here he at once came into prominence with his political essays, collected under the title Das neue Jahrhundert, in two parts—Polen (1833) and Politische Briefe (1833)—and with the novel Das junge Europa, in three parts—Die Poeten, Die Krieger, Die Bürger—(1833-1837). These writings, in which, after the fashion of Heinrich Heine and Ludwig Börne, he severely criticized the political régime in Germany, together with the part he played in the literary movement known as Das junge Deutschland, led to the university expelling him, and the Prussian government was about to suppress him. On his return, in 1834, from a journey to Italy, undertaken in the company of Karl Gutzkow, Laube was expelled from Saxony and imprisoned for nine months in Berlin. In 1836 he married the widow of Professor Hänel of Leipzig; almost immediately afterwards he suffered a year's imprisonment for his revolutionary sympathies. In 1839 he again settled in Leipzig and began a literary activity as a playwright. Chief among his earlier productions are the tragedies Monadelechi (1845) and Strenuose (1847); the comedies Kokoko, oder die alten Herren (1846); Goitsch und Gellert (1847); and Die Karlsschüler (1847), of which the youthful Schiller is the hero. In 1845 Laube was elected to the national assembly at Frankfort-on-Main for the district of Elbogen, but resigned in the spring of 1846. In 1848 he was appointed artistic director of the Hofburg theatre in Vienna. This office he held until 1867, and in this period fall his finest dramatic productions, notably the tragedies Graf Essen (1856) and Monthrose (1859), and his historical romance Der deutsche Krieg (1865-1866, 9 vols.), which graphically pictures a period in the Thirty Years' War. In 1869 he became director of the Leipzig Stadttheater, but returned to Vienna in 1870, where in 1872 he was placed at the head of the new Stadttheater; with the exception of a short interval he managed this theatre with brilliant success until his retirement from public life in 1880. He has left a valuable record of his work in Vienna and Leipzig in the three volumes Das Burgtheater (1868), Das nordische Theater (1872) and Das Wiener Stadttheater (1873). His pen was still active after his retirement, and in the five years preceding his death, which took place at Vienna on the 1st of August 1884, he wrote the romances and novels Die Böhmingen (1880), Louison (1881), Der Schatten-Wilhelm (1883), and published an interesting volume of reminiscences, Erinnerungen, 1841-1881 (1882). Laube's dramas are not remarkable for originality or for poetical beauty; their real and great merit lies in their stage-craft. As a theatre-manager he has had no equal in Germany, and his services in this capacity have assured him a more lasting name in German literary history than his writings.

His Gesammelte Schriften (excluding his dramas) were published in 16 vols. (1875-1882); his Dramatische Werke in 13 vols. (1845-1875); and his essays and lectures in the latter of 12 vols. (1880-1892). An edition of Laube's Ausgegebene Werke in 10 vols. appeared in 1906 with an introduction by H. H. Houben. See also J. Proels, Das junge Deutschland (1892); and H. Bulthaupt, Dramaturgie des Schau- spiels (vol. ii., 6th ed., 1895).

L'AUBESPINE, a French family which sprang from Claude de l'Aubespine, a lawyer of Orleans and bailiff of the abbey of St. Evverte in the beginning of the 16th century, and rapidly acquired distinction in offices connected with the law. Sebastien de l'Aubespine (d. 1582), abbot of Bassefontaine, bishop of Vannes and afterwards of Limoges, fulfilled important diplomatic missions in Germany, Hungary, England, the Low Countries and Switzerland under Francis I. and his successors. Claude (d. 1600-1657), baron of Châteauneuf-sur-Cher, Sebastien's brother, was a secretary of finance; he had charge of negotiations with England in 1555 and 1559, and was several times commissioned to treat with the Huguenots in the king's name. His son Guillaume was a councillor of state and ambassador to England. Charles de l'Aubespine (1585-1653) was ambassador to Germany, the Low Countries, Venice and England, besides twice holding the office of keeper of the seals of France, from 1630 to 1633, and from 1639 to 1631. The family fell into poor circumstances and became extinct in the 19th century. (M.P.)

LAUCHSTÄDT, a town of Germany in the province of Prussian Saxony, on the Laucha, 6 m. N.W. of Merseburg by the railway to Schaffstädten. Pop. (1905) 2034. It contains an Evangelical church, a theatre, a hydropathic establishment and several educational institutions, among which is an agricultural school affiliated to the university of Halle. Its industries include malting, vinegar-making and brewing. Lauchstädt was a popular watering-place in the 18th century, the dukes of Saxe-Merseburg often making it their summer residence. From 1789 to 1811 the Weimar court theatrical company gave performances here of a part of Schiller's Wallenstein, an attraction which greatly contributed to the well-being of the town.

See Maak, Das Goethetheater in Lauchstädt (Lauchstädt, 1905); and Nasemann, Bad Lauchstädt (Halle, 1885).

LAUD, WILLIAM (1573—1645), English archbishop, only son of William Laud, a clothier, was born at Reading on the 7th of October 1573. He was educated at Reading free school, matriculated at St John's college, Oxford, in 1580, gained a scholarship in 1590, a fellowship in 1593, and graduated B.A. in 1594, proceeding to D.D. in 1608. In 1601 he took orders, in 1603 becoming chaplain to Charles Blount, earl of Devonshire. Laud early took up a position of antagonism to the Calvinistic party in the church, and in 1604 was reproved by the authorities for maintaining in his thesis for the degree of B.D. "that there could be no true church without bishops, and again in 1606 for the opposing "popish" opinions in his sermon at St Mary's. If high-church doctrines, however, met with opposition at Oxford, they were relished elsewhere, and Laud obtained rapid advancement. In 1607 he was made vicar of Stanford in Northamptonshire, and in 1608 he became chaplain to Bishop Nelle, who in 1610 presented him to the living of Cuxton, when he resigned his fellowship. In 1611, in spite of the influence of Archbishop Abbot and Lord Chancellor Ellesmere, Laud was made president of St John's, and in 1614 obtained in addition the prebend of Buckden, in 1615 the archdeaconry of Huntingdon, and in 1616 the deanery of Gloucester. Here he repaired the fabric and changed the position of the communion table, a matter which aroused great religious controversy, from the centre of the choir to the east end, by a characteristic tactless exercise of power offending the bishop, who henceforth refused to enter the
cathedral. In 1617 he went with the king to Scotland, and aroused hostility by wearing the surplice. In 1621 he became bishop of St David's, when he resigned the presidency of St John's.

In April 1622 Laud, by the king's orders, took part in a controversy with Percy, a Jesuit, known as Fisher, the aim of which was to prevent the conversion of the countless of Buckingham, the favourite's mother, to Romanism, and his opinions expressed on that occasion show considerable breadth and comprehension. While refusing to acknowledge the Roman Church as the true church, he allowed it to be a true church and a branch of the Catholic body, at the same time emphasizing the perils of knowingly associating with error; and with regard to the English Church he denied that the acceptance of all its articles was necessary. The foundation of belief was the Bible, not any one branch of the Catholic church arrogating to itself infallibility, and when dispute on matters of faith arose, "a lawful and free council, determining according to Scripture, is the best judge on earth." A close and somewhat strange intimacy, considering the difference in the characters and ideals of the two men, between Laud and Buckingham now began, and proved the chief instrument of Laud's advancement. The opportunity came with the old king's death in 1625, for James, with all his pedantry, was too wise and cautious to embark in Laud's rash undertakings, and had already shown a prudent moderation, after setting up bishops in Scotland, in going no further in opposition to the religious feelings of the people. On the accession of Charles, Laud's ambitious activities were allowed free scope. A list of the clergy was immediately prepared by him for the king, in which each name was labelled with an O or a P, distinguishing the Orthodox to be promoted from the Puritans to be suppressed. Laud defended Richard Montague, who had aroused the wrath of the parliament by his pamphlet against Calvinism. His influence soon extended into the domain of the state. He supported the king's prerogative throughout the conflict with the parliament, preached in favour of it before Charles's second parliament in 1626, and assisted in Buckingham's defence. In 1626 he was nominated bishop of Bath and Wells, and in July 1628 bishop of London. On the 12th of April 1629 he was made chancellor of Oxford University.

In the patronage of learning and in the exercise of authority over the morals and education of youth Laud was in his proper sphere, many valuable reforms at Oxford being due to his activity, including the codification of the statutes, the statute by which public examinations were rendered obligatory for university degrees, and the ordinance for the election of proctors, the reviving of the college system, of moral and religious discipline and order, and of academic dress. He founded or endowed various professorships, including those of Hebrew and Arabic, and the office of public orator, encouraged English and foreign scholars, such as Voss, Selden and Jeremy Taylor, founded the university printing press, procuring in 1633 the royal patent for Oxford, and obtained for the Bodleian library over 1300 MSS., adding a new wing to the building to contain his gifts. His rule at Oxford was marked by a great increase in the number of students. In his own college he erected the new buildings, and was its second founder. Of his chancellorship he himself wrote a history, and the Laudian tradition long remained the great standard of order and good government in the university. Elsewhere he showed his liberality and his zeal for reform. He was an active visitor of Eton and Winchester, and endowed the grammar school at Reading, where he was himself educated. In 1618 the king proceeded for the restoration of the dilapidated cathedral of St Paul's.

He was far less great as a ruler in the state, showing as a judge a tyrannical spirit both in the star chamber and high commission court, threatening Felton, the assassin of Buckingham, with the rack, and showing special activity in procuring a cruel sentence in the former court against Alexander Leighton in June 1630 and against Henry Sherfield in 1634. His power was greatly increased after his return from Scotland, whither he had accompanied the king, by his promotion to the archbishopric of Canterbury in August 1633. "As for the state indeed," he wrote to Wentworth on this occasion, "I am for Thorough."

In 1636 the privy council decided in his favour his claim of jurisdiction as visitor over both universities. Soon afterwards he was placed on the commission of the treasury and on the committee of the privy council for foreign affairs. He was all-powerful both in church and state. He proceeded to impose by authority the religious ceremonies and usages to which he attached so much importance. His vicar-general, Sir Nathaniel Brent, went through the dioceses of his province, noting every dilapidation and every irregularity. The pulpil was no longer to be the chief feature in the church, but the communion table. The Puritan lecturers were suppressed. He showed great hostility to the Puritan sabbath and supported the reissue of the Book of Sports, especially odious to that party, and severely reprimanded Chief Justice Richardson for his interference with the Somerset wakers. He insisted on the use of the prayer-book among the English soldiers in the service of Holland, and forced strict conformity on the church of the merchant adventurers at Delft, endeavouring even to reach the colonists in New England. He tried to compel the Dutch and French refugees in England to unite with the Church of England, advising double taxation and other forms of persecution. In 1634 the justices of the peace were ordered to enter houses to search for persons holding conventicles and bring them before the commissioners. He took pleasure in displaying his power over the great, and in punishing them in the spiritual courts for moral offences. In 1637 he took part in the sentence of the star chamber on Prynne, Bastwick and Burton, and in the same year in the prosecution of Bishop Williams. He urged Strafford in Ireland to carry out the same reforms and severities.

He was now to extend his ecclesiastical system to Scotland, where during his visits the appearance of the churches had greatly displeased him. The new prayer-book and canons were drawn up by the Scottish bishops with his assistance and enforced in the country, and, though not officially connected with the work, he was rightly regarded as its real author. The attack not only on the national religion, but on the national independence of Scotland, proved to be the point at which the system, already strained, broke and collapsed. Laud continued to support Strafford's and the king's arbitrary measures to the last, and spoke in favour of the vigorous continuation of the war on Strafford's side in the memorable meeting of the committee of eight on the 5th of May 1640, and for the employment of any means for carrying it on. "I tried all ways," so ran the notes of his speech, "and refused all ways. By the law of God and man you may make God afraid and man do your will." He was at first opposed to the setting of convocation, after the dissolution of parliament, as an independent body, on account of the opposition it would arouse, he yet caused to be passed in it the new canons which both enforced his ecclesiastical system and assisted the king's divine right, resistance to his power entailing "damnation." Laud's infatuated policy could go no further, and the eletora oath, according to which whole classes of men were to be forced to swear perpetual allegiance to the government of this church by archbishops, bishops, deans and archdeacons, &c., was long remembered and derided. His power now quickly abandoned him. He was attacked and reviled as the chief author of the troubles on all sides. In October he was ordered by Charles to suspend the eletora oath. The same month, when the high commission court was sacked by the mob, he was unable to persuade the star chamber to punish the offenders. On the 18th of December he was impeached by the Long Parliament, and on the 1st of March imprisoned in the tower. On the 12th of May, at Strafford's request, the archbishop appeared at the window of his cell to give him his blessing on his way to execution, and fainted as he passed by. For some time he was left unnoticed in confinement. On the 31st of May 1643, however, Prynne received orders from the parliament to search his papers, and published a mutilated edition of his diary. The articles of impeachment were sent up to the Lords in October, the trial beginning on the 12th of March 1644, but the attempt
to bring his conduct under a charge of high treason proving hopeless, an attainder was substituted and sent up to the Lords on the 22d of November. In these proceedings there was no semblance of respect for law or justice, the Lords yielding (4th of January 1645) to the menaces of the Commons, who arrogated to themselves the right to declare any crimes they pleased high treason. Laud now tendered the king’s pardon, which had been granted to him in April 1643. This was rejected, and it was with some difficulty that his petition to be executed with the axe, instead of undergoing the ordinary brutal punishment for high treason, was granted. He suffered death on the 10th of January on Tower Hill, asserting his innocence of any offence known to the law, repudiating the charge of “popery,” and declaring that he had always lived in the Protestant Church of England. He was buried in the chancel of All Hallows, Barking, whence his body was removed on the 24th of July 1663 to the chapel of St. John’s College, Oxford.

Laud never married. He is described by Fuller as “low of stature, little in bulk, cheerful in countenance (wherein gravity and quickness were all compounded), of a sharp and piercing eye, clear judgment and (abating the influence of age) firm memory.” His personality, on account of the sharp religious antagonisms with which his name is inevitably associated, has rarely been judged with impartiality. His severities were the result of a narrow mind and not of a vindictive spirit, and their number has certainly been exaggerated. His career was distinguished by uprightness, by piety, by a devotion to duty, by courage and consistency. In particular it is clear that the charge of partiality for Rome is unfounded. At the same time the circumstances of the period, the fact that various schemes of union with Rome were abroad, that the missions of Panzani and later of Conn were gathering into the Church of Rome numbers of members of the Church of England who, like Laud himself, were dissatisfied with the Puritan bias which then characterized it, the incident mentioned by Laud himself of his being twice offered the cardinalate, the movement carried on at the court in favour of Laud and the fact that changes in ritual, however clearly defined and restricted in his own intention, all tended towards Roman practice, fully warranted the suspicions and fears of his contemporaries. Laud’s complete neglect of the national sentiment, in his belief that the exercise of mere power was sufficient to suppress it, is a principal proof of his total lack of true statesmanship. The hostility to “innovations in religion,” it is generally allowed, was a far stronger incentive to the rebellion against the arbitrary power of the crown, than even the violation of constitutional liberties; and to Laud, therefore, more than to Strafford, to Buckingham, or even perhaps to Charles himself, is especially due the responsibility for the catastrophe. He held fast to the great idea of the catholicity of the English Church, to that conception of it which regards it as a branch of the whole Christian church, and emphasizes its historical continuity and identity from the time of the apostles, but here again his policy was at fault; for his desire to maintain and restrict the tendencies to separatism and independentism which finally prevailed, but excluded large bodies of faithful churchmen from communion with their church and from their country. The emigration to Massachusetts in 1629, which continued in a stream till 1640, was not composed of separatists but of episcopalian. Thus what Laud grasped with one hand he destroyed with the other.

Passing to the more indirect influence of Laud on his times, we can observe a narrowness of mind and aim which separates him from a man of such high imagination and idealism as Strafford, however closely identified their policies may have been for the moment. The chief feature of Laud’s administration is attention to countless details, to the most trivial of which he attached excessive importance, and which are uninspired by any great underlying principle. His view was always essentially material. The one element in the church which to him was all essential was its visibility. This was the source of his intense dislike of the Puritan and Nonconformist conception of the church, which afforded no tangible or definite form. Hence the necessity for outward conformity, and the importance attached to ritual and ceremony, unity in which must be established at all costs, in contrast to dogma and doctrine, in which he showed himself lenient and large-minded, winning over Hales by friendly discussion, and encouraging the publication of Chillingworth’s Religion of Protestants. He was not a bigot, but a martinet. The external form was with him the essential feature of religion, preceding the spiritual conception, and in Laud’s opinion being the real foundation of it. In his last words on the scaffold he alludes to the dangers and slanders he had endured labouring to keep an uniformity in the external service of God; and Bacon’s conception of a spiritual union founded on variety and liberty was one completely beyond his comprehension.

This narrow materialism was the true cause of his fatal influence both in church and state. In his own character it produced the somewhat blunted moral sense which led to the few incidents in his career which need moral defence, his performance of the marriage ceremony between his first patron Lord Devonshire and the latter’s mistress, the divorced wife of Lord Rich, an act completely at variance with his principles; his strange intimacy with Buckingham; his love of power and place. Indistinguishable from his personal ambition was his passion for the aggrandisement of the church and its predominance in the state. He was greatly delighted at the foolish appointment of Bishop Juxon as lord treasurer in 1636. “No churchman had it,” he cries exultingly, “since Henry VII’s time, . . . and now if the church will not hold up themselves under God, I can do no more.” Spiritual influence, in Laud’s opinion, was not enough for the church. The church as the guide of the nation in duty and godliness, even extending its activity into state affairs as a mediator and a moderator, was not sufficient. Its power must be material and visible, embodied in great places of secular administration and enfronned in high offices of state. Thus the church, descending into the political arena, became identified with the doctrines of one political party in the state—doctrines odious to the majority of the nation—and at the same time became associated with acts of violence and injustice, losing at once its influence and its reputation. Equally disastrous to the state was the identification of the king’s administration with one party in the church, and that with the party in an immense minority not only in the nation but even among the clergy themselves.

BIBLIOGRAPHY.—All Laud’s works are to be found in the Library of Anglo-Catholic Theology (7 vols.), including his sermons (of no great merit), letters, history of the chancellorship, history of his troubles and his reasoning, and his remaining works. His MSS. of the last two works are in the possession of the property of St. John’s College. Various modern opinions of Laud’s career can be studied in T. Longueville’s Life of Laud, by a Romish Recusant (1894); Congressional Union Jubilee Lectures, vol. ii.; H. Hutton, Bishop of Rich, by A. C. Benson (1887); Wm. Laud, by W. H. Hutton (1895); Archbishop Laud Commemoration, ed. by W. F. Collins (lectures, bibliography, catalogue of exhibits, 1895); Hook’s Lives of the Archbishops of Canterbury; and H. Bell, Archbishop Laud and Priestly Government (1907).

LAUD (Lat. laudus), a term meaning praise, now rarely found in this sense except in poetry or hymns. Laud is the name for the second of the offices of the canonical hours in the Roman breviary, so called from the three laudes or psalms of praise, cxvii.-cl. which form part of the service (see breviary and hours, canonical).

LAUDANUM, originally the name given by Paracelsus to a famous medical preparation of his own composed of gold, pearls, &c. (Opera, 1658, i. 402/9), but containing opium as its chief ingredient. The term is now only used for the alcoholic tincture of opium (q.v.). The name was either invented by Paracelsus from Lat. laudare to praise, or was a corrupted form of “ladanum” (Gr. ἱδάον, from Pers. ladan), a resinous juice or gum obtained from various kinds of the Cistus shrub, formerly used medicinally in external applications and as a stomachic, but now only in perfumery and in the making of sweet flowers, &c.

LAUDER, SIR THOMAS DICK, Bart. (1783–1848), Scottish author, only son of Sir Andrew Lauder, 6th baronet, was born at Edinburgh in 1784. He succeeded to the baronetcy in 1820. His first contribution to Blackwood’s Magazine in 1817, entitled
LAUDER, W.—LAUDERDALE, DUKE OF

279

"Simon Roy, Gardener at Dunphail," was by some ascribed to Sir Walter Scott. His paper (1838) on "The Parallel Roads of Glenroy," printed in vol. ix. of the Transactions of the Royal Society of Edinburgh, first drew attention to the phenomenon in question. In 1825 and 1827 he published two romances, Lochandel and the Wolf of Badenoch. He became a frequent contributor to Blackwood and also to Tait's Magazine, and in 1830 he published An Account of the Great Floods of August 1829 in the Province of Moray and adjoining Districts. Subsequent works were Highland Rambles, with Long Tales to Shorten the Way (2 vols. 8vo, 1837), Legendary Tales of the Highlands (3 vols. 12mo, 1841), Tour round the Coasts of Scotland (1842) and Memorial of the Royal Progress in Scotland (1843). Vol. i. of a Miscellany of Natural History, published in 1833, was also partly prepared by Lauder. He was a Liberal, and took an active interest in politics; he held the office of secretary to the Board of Scottish Manufactures. He died on the 29th of May 1848. An unfinished series of papers, written for Tait's Magazine shortly before his death, was published under the title Scottish Rivers, with a preface by John Brown, M.D., in 1871.

LAUDER, WILLIAM (d. 1771), Scottish literary forger, was born in the latter part of the 17th century, and was educated at Edinburgh university, where he graduated in 1695. He applied unsuccessfully for the post of professor of humanity there, in succession to Adam Watt, whose assistant he had been for a time, and also for the keepership of the university library. He was a good scholar, and in 1739, published Poetarum Scotorum Musae Sacrae, a collection of poems by various writers, mostly paraphrased from the Bible. In 1742 Lauder came to London. In 1747 he wrote an article for the Gentleman's Magazine to prove that Milton's Paradise Lost was largely a plagiarism from the Adamus Exul (1601) of Hugo Grotius, the Sarcotis (1654) of J. Masen (Masenius, 1606-1681), and the Poema Sacra (1633) of Andrew Ramsay (1574-1659). Lauder expounded his case in a series of articles, and in a book (1753) increased the list of plagiarists and shortened his succession. Some scholars, who had independently studied the alleged sources of Milton's inspiration, proved conclusively that Lauder had not only garbled most of his quotations, but had even inserted amongst them extracts from a Latin rendering of Paradise Lost. This led to his exposure, and he was obliged to write a complete confession at the dictation of his former friend Samuel Johnson. After several vain endeavours to clear his character he emigrated to Barbadoes, where he died in 1771.

LAUDER, a royal and police burgh of Berwickshire, Scotland. Pop. (1901) 779. It is situated on the Leader, 29 m. S.E. of Edinburgh by the North British railway's branch line from Fountainhall, of which it is the terminus. The burgh is said to date from the reign of William the Lion (1165-1214); its charter was granted in 1502. In 1482 James III. with his court and army rested here on the way to raise the siege of Berwick. While the nobles were in the church considering grievances, Robert Crichton (q.v.), the abbot of Furness, raised a party, and one of the king's favourites, whose "removal" was at the very moment under discussion, demanded admittance. Archibald Douglas, earl of Angus, opened the door and seized Mar, who was forthwith dragged to Lauder Bridge and there, along with six other obnoxious favourites, hanged in sight of his royal master. It was in connexion with this exploit that Angus acquired the nickname of "Bell-the-cat." The public buildings include a town-hall and a library. The parish church was built in 1573 by the earl of Lauderdale, in exchange for the older edifice, the site of which was required for the enlargement of Thirlestane castle, which, originally a fortress, was then remodelled for a residence. The town is a favourite with anglers.

LAUDERDALE, JOHN MAITLAND, DUKE OF (1616-1682), eldest surviving son of John Maitland, 2nd Lord Maitland of Thirlestane (d. 1643), who was created earl of Lauderdale in 1624, and Lady Isabel Seton, daughter of Alexander, earl of Dunfermline, and great-grandson of Sir Richard Maitland (q.v.), the poet, a member of an ancient family of Berwickshire, was born on the 24th of May 1616, at Lethington. He began public life as a zealous adherent of the Presbyterian cause, took the covenant, sat as an elder in the assembly at St Andrews in July 1643, and was sent to England as a commissioner for the covenant in August, and to attend the Westminster assembly in November. In February 1644 he was a member of the committee of both kingdoms, and on the 20th of November was one of the commissioners appointed to treat with the king at Uxbridge, when he made efforts to persuade Charles to agree to the establishment of Presbyterianism. In 1645 he advised Charles to reject the proposals of the Independents, and in 1647 approved of the king's surrender to the Scots. At this period Lauderdale veered round completely to the king's cause, had several interviews with him, and engaged in various projects for his restoration, offering the aid of the Scots, on the condition of Charles's consent to the establishment of Presbyterianism, and on the 26th of December he obtained from Charles at Carisbrooke "the engagement" by which Presbyterianism was to be established for three years, schismatics were to be suppressed, and the acts of the Scottish parliament ratified, the king in addition promising to admit the Scottish nobles into public employment in England and to reside frequently in Scotland. Returning to Scotland, in the spring of 1648, Lauderdale joined the party of Hamilton in alliance with the English royalists. Their defeat at Preston postponed the arrival of the prince of Wales, but Lauderdale had an interview with the prince in the Downs in August, and from this period obtained supreme influence over the future king. He persuaded him later to accept the invitation to Scotland from the Argyll faction, accompanied him thither in 1650 and in the expedition into England, and was taken prisoner at Worcester in 1651, remaining in confinement till March 1660. He joined Charles in May 1660 at Breda, and, in spite of the opposition of Clarendon and Monk, was appointed secretary of state. From this time onwards he kept his hold upon the king, was lodged at Whitehall, was "never from the king's ear nor council," and maintained his position against "several envious adversaries by a crafty dexterous in dealing with men, a fearless unscrupulousness, and a robust strength of will, which overcame all opposition. Though a man of considerable learning and intellectual attainment, his character was exceptionally and grossly licentious, and his base and ignoble career was henceforward unredeemed by a single redeeming feature. He abandoned Argyll to his fate, permitted, if he did not assist in, the restoration of episcopacy in Scotland, and after triumphing over all his opponents in Scotland drew into his own hands the whole administration of that kingdom, and proceeded to impose upon it the absolute supremacy of the crown in church and state, restoring the nomination of the lords of the articles to the king and initiating severe measures against the Covenanters. In 1669 he was able to boast with truth that "the king is now master here in all causes and over all persons."

His own power was now at its height, and his position as the favourite of Charles, controlled by no considerations of patriotism or state, and completely independent of the English parliament, recalled the worst scandals and abuses of the Stuart administration before the Civil War. He was a member of the cabal ministry, but took little part in English affairs, and was not entrusted with the first secret treaty of Dover, but gave personal support to Charles in his degrading demands for pensions from Louis XIV. On the 2nd of May 1672 he was created duke of Lauderdale and earl of March, and on the 3rd of June knight of the garter. In 1673, on the resignation of James in consequence of the Test Act, he was appointed a commissioner for the admiralty. In October he visited Scotland to suppress the dissenters and obtain money for the Dutch War, and the intrigues organized by Shaftesbury against his power in his absence, and the attacks made upon him in the House of Commons in January 1674 and April 1675, were alike rendered futile by the steady support of Charles and James. On the 25th of June 1674 he was created earl of Guildford and Baron Petersham, and was created sergeant-at-law. On the 29th of July 1674 he was made Lord High Commissioner and became the peerage of England. His ferocious measures having failed to suppress the conventicles in Scotland, he summoned to his 1 Pepys's Diary, 2nd of March 1664.
aid in 1677 a band of Highlanders, who were sent into the western country. In consequence, a large party of Scottish nobles came to London, made common cause with the English country faction, and compelled Charles to order the disbandment of the marauders. In May 1678 another demand by the Commons for Lauderdale's removal was thrown out by court influence by one vote. He maintained his triumphs almost to the end. In Scotland, which he visited immediately after this victory in parliament, he overbore all opposition to the king's demands for money. Another address for his removal from the Commons in England was suppressed by the dissolution of parliament on the 26th of May 1679, and a renewed attack upon him, by the Scottish party and Shaftesbury's faction combined, also failed. On the 22nd of June 1679 the last attempt of the unfortunate Covenanters was suppressed at Bothwell Brig. In 1680, however, falling health obliged Lauderdale to resign the place and power for which he had so long successfully struggled. His vote given for the execution of Lord Stafford on the 29th of November is said also to have incurred the displeasure of James. In 1683 he was stripped of all his offices, and he died in August. Lauderdale married (1) Lady Anne Home, daughter of the 1st earl of Home, by whom he had one daughter; and (2) Lady Elizabeth Murray, daughter of the 1st earl of Dysart and widow of Sir Lionel Tollemache. He left no male issue, consequently his dukedom and his English titles became extinct, but he was succeeded in the earldom by his brother Charles (see below).

Earls of Lauderdale.

Charles Maitland, 3rd earl of Lauderdale (d. 1691), became an ordinary lord of session as Lord Halton in 1669, afterwards assisting his brother, the duke, in the management of public business in Scotland. His eldest son, Richard (1663-1695), became the 4th earl. As Lord Earl he had no issue. The conduct of his younger brother, James, 5th earl, was adherent of James II. and after fighting at the battle of the Boyne he was an exile in France until his death. This earl made a verse translation of Virgil (published 1717). He left no sons, and his brother John (d. 1719) continued as 5th earl. His son William III., and of the union of England and Scotland, was succeeded by his son Charles (c. 1688-1744), who was the grandson of James, the 5th earl.

James Maitland, 8th earl of Lauderdale (1720-1830), was a member of parliament for Edinburgh until August 1789 when he succeeded his father in the earldom. In the House of Commons he took an active part in debate, and in the House of Lords, where he was a representative peer for Scotland, he was prominent as an opponent of the policy of Pitt and the English government with regard to France, a country he had visited in 1722. In 1806 he was made a peer of the United Kingdom as Baron Lauderdale of Thirlestane and for a short time he was keeper of the great seal of Scotland. For this time he published an Inquiry into the Nature and Origin of Public Wealth (1804 and 1810), a work which has been translated into French and Italian and which produced a controversy between the author and Lord Brougham; The Political Discourses of James Boswell (ed. 1852), and a number of reprints of the papers of the Lord Advocate, with other writings of a similar nature. He was succeeded by his sons James (1784-1860) and Anthony (1785-1863) as 9th and 10th earls. Anthony, a naval officer, died unmarried in March 1863, without issue. The title was united with the earldom of Lauderdale in 1822-1884, and the 12th earl was the successor. He had a large family and left no male issue. The title then passed to his younger brother, James, 13th earl of Lauderdale (1820-1871), the son of his heir. Of this family were the 14th and 15th earls, who were also the 19th and 20th earls, the last of whom, Baron Rayleigh-Maitland (1822-1884), was the 13th earl.

The earls of Lauderdale are hereditary standard bearers for Scotland.

LAUNCESTON, a city in the county of Cornwall, England, situated on the east coast of the peninsula occupied by Cornwall, at the mouth of the Tamar, a river that flows into the Atlantic Ocean. The city is an ancient town, and was granted a charter of incorporation in 1291. It is a market town and a port, and is celebrated for its ancient abbey, founded in 1170 and dedicated to St. Mary. The abbey was dissolved in 1539, and the site is now occupied by the town hall and other public buildings. The city is a resort for tourists, and is noted for its fine scenery and its historic associations.

William II., to Wiesbaden, being at the same time promoted to major's rank, in order that he might devote his great dramatic talents to the royal theatre. His literary career began with the epic poems Jan van Calker, ein Malerlei von Niederhein (1887, 3rd ed., 1892) and Der Heldensteiner, ein Sang aus dem Bauernkriege (3rd ed., 1896). These were followed by Die Overstolzin (5th ed., 1900), Herodias (2nd ed., 1898) and the Geislerin (4th ed., 1902). He also wrote the novels Die Hexe (6th ed., 1900), Regina coeli (a story of the fall of the Dutch Republic) (7th ed., 1904), Die Hauptmannswitwe (8th ed., 1903) and Marie Verwahnken (1903). But he is best known as a dramatist. Beginning with the tragedy Ignes de Castro (1894), he proceeded to dramatize the great monarchs of his country, and, in a Hohenzollern tetralogy, issued Der Burggraf (1897, 6th ed. 1900) and Der Eisenbahn (1900), to be followed by Der grosse Kurfürst (The Great Elector) and Friedrich der Große (Frederick the Great).

See A. Schroeter. Josef Lauff, Ein litterarisches Bildt (1899), and B. Sturm, Josef Lauff (1903).

LAUGHTER—LAUNCH

Laughter, the visible and audible expression of mirth, pleasure or the sense of the ridiculous by the movements of the facial muscles and inarticulate sounds (see Comedy, Play and Humor). The O. Eng. klehdtar is formed from klehhan, to laugh, a common Teutonic word; cf. Ger. lachen, Goth. klaskan, Icel. klaga, &c. These are in origin echo or imitative words, to be referred to a Teut. base kla-, Inclo-Euro. kark-, to make a noise; Skeat (Elym. Dict., 1898) connects ultimately Gr. κλάσεις, to cluck like a hen, κραζείν, to croak, &c. A gentle and inaudible form of laughter expressed by a movement of the lips and by the eyes is a "smile." This is a comparatively late word in English, and is due to Scandinavian influence; cf. Swed. smiila; it is ultimately connected with Lat. mirari, to wonder, and probably with Gr. μεῖκος.

Laumont, François Pierre Nicholas Gillet de (1747–1834), French mineralogist, was born in Paris on the 28th of May 1747. He was educated at a military school, and served in the army from 1772–1784, when he was appointed inspector of mines. His attention in his leisure time was wholly given to mineralogy, and he assisted in organizing the new École des Mines in Paris. He was author of numerous mineralogical papers in the Journal and Annales des Mines. The mineral laumontite was named after him by Hauy. He died in Paris on the 1st of June 1834.

Launceston, a market town and municipal borough in the Launceston parliamentary division of Cornwall, England, 35½ m. N.W. of Plymouth, on branches of the Great Western and the London & South-Western railways. Pop. (1901) 4053. It lies in a hilly district by and above the river Kensey, an affluent of the Tamar, the houses standing picturesquely on the southern slope of the narrow valley, with the keep of the ancient castle crowning the summit. On the northern slope lies the parish of St Stephen. The castle, the ruins of which are in part of Norman date, was the seat of the earls of Cornwall, and was frequently besieged during the civil wars of the 17th century. In 1656 George Fox the Quaker was imprisoned in the north-east tower for disturbing the peace at St Ives by distributing tracts. Fragments of the old town walls and the south gateway to the castle remain standing. The church of St Mary Magdalene, built of granite, and richly ornamented without, was erected early in the 16th century, but possesses a detached tower dated 1380. A fine Norman doorway, now appearing as the entrance to a hotel, is preserved from an Augustinian priory founded in the reign of Henry I. The parish church of St Stephen is Early English, and later, with a Perpendicular tower. The trade of Launceston is chiefly agricultural, but there are tanneries and iron foundries. The borough is under a mayor, 4 aldermen and 12 councillors. Area, 2189 acres.

A silver penny of Ethelred II. testifies to the fact that the privilege of coining money was exercised by Launceston (Dunheved, Lancesavon, Lanstone) more than half a century before the Norman conquest. At the time of the Domesday survey the canons of St Stephen held Launceston, and the count of Mortain held Dunheved. The number of families settled on the manor is not given, but attention is called to the market which had been removed thence by the count to the neighbouring castle of Dunheved, which had two mills, one villein and thirteen bordars. A spot more favoured by nature could not have been chosen either for settlement or for defence than the rich lands near the confluence of the Kensey and Tamar, out of which there rises abruptly the gigantic mound upon which the castle is built. It is not known when the canons settled here nor whether the count's castle, then newly erected, replaced some earlier fortification. Reginald, earl of Cornwall (1140–1179), granted to the canons rights of jurisdiction in all their lands and exemption from suit of court in the shire and hundred courts. Richard (1225–1279), king of the Romans, constituted Dunheved a free borough, and granted to the burgesses freedom from portage, stallage and suillage, liberty to elect their own reeves, exemption from all pleas outside the borough except pleas of the crown, and a site for a gild-hall. The farm of the borough was fixed at 100s. payable to the earl, 65s. to the prior and 100s. 1d. to the lepers of St Leonard's. In 1295 the market held on Saturday was changed to Thursday. An inquisition held in 1383 disclosed two markets, a merchant gild, pillar and tumbar. In 1555 Dunheved, otherwise Launceston, received a charter of incorporation, the common council to consist of a mayor, 8 aldermen and a recorder. By its provisions the borough was governed until 1835. The parliamentary franchise which had been conferred in 1294 was confined to the corporation and a number of free burgesses. In 1832 Launceston was shorn of one of its members, and in 1885 merged in the county. Separated from it by a small bridge over the Kensey lies the hamlet of Newport which, from 1547 until 1832, also returned two members. These were swept away when the Reform Bill became law. Launceston was the assize town until Earl Richard, having built a palace at Restormel, removed the assize to Lostwithiel. In 1386 Launceston regained the privilege by royal charter. From 1715 until 1837, eleven years only excepted, the assize was held alternately here and at Bodmin. Since that time Bodmin has enjoyed the distinction. Launceston has never had a staple industry. The manufacture of serge was considerable early in the 19th century. Its market on Saturdays is well attended, and an ancient fair on the Feast of St Thomas is among those which survive.

See A. F. Robbins, Launceston Past and Present.

Launceston, the second city of Tasmania, in the county of Cornwall, on the river Tamar, 40 m. from the N. coast of the island, and 133 m. by rail N. by W. of Hobart. The city lies amid surroundings of great natural beauty in a valley enclosed by lofty hills. Cora Lawn, about 6 m. distant, a deep gorge of the North Esk river, the Punch Bowl and Cataract Gorge, over which the South Esk falls in a magnificent cascade, joining the North Esk to form the Tamar, are spots famed throughout the Australian Commonwealth for their romantic beauty. The city is the commercial capital of northern Tasmania, the river Tamar being navigable up to the town for vessels of 4000 tons. The larger ships lie in midstream and discharge into lighters, while vessels of 2000 tons can berth alongside the wharves, to which the railway from the town to Launceston is well named, pleasant town, lighted by electricity, with numerous parks and squares and many fine buildings. The post office, the custom house, the post office savings bank and the Launceston bank form an attractive group; the town hall is used exclusively for civic purposes, public meetings and social functions being held in an elegant building called the Albert hall. There are also a good art gallery, a theatre and a number of fine churches, one of which, the Anglican church of St John, dates from 1824. The city, which attained that rank in 1880, has two attractive suburbs, Invermay and Trevallyn; it has a racecourse at Mowbray 2 m. distant, and is the centre and port of an important fruit-growing district. Pop. of the city proper (1901) 18,022, of the city and suburbs 21,150.

Lauch. (1) A verb meaning originally to hurl, discharge a missile or other object, also to rush or shoot out suddenly
LAUNDRY

or rapidly. It is particularly used of the setting afloat a vessel from the stocks on which she has been built. The word is an adaptation of O. Fr. lancier, lancier, to hurl, throw, Lat. lanceare, from lancea, a lance or spear. (2) The name of a particular type of boat, usually applied to one of the largest size of ships' boats, or to a large boat moved by electricity, steam or other power. The word is an adaptation of the Span. lancha, pinnace, which is usually connected with lancara, the Portuguese name, common in 16th and 17th century histories, for a fast-moving small vessel. This word is of Malay origin and is derived from lanchar, quick, speedy.

LAUNDRY, a place or establishment where soiled linen, etc., is washed. The word is a contraction of an earlier form laundery, from Lat. lavanda, things to be washed, lavare, to wash. "Launder," a similar contraction of lavender, was one of (either sex) who washes linen; from its use as a verb came the form "lauderer," employed as both masculine and feminine in America, and the feminine form "laundress," which is also applied to a female caretaker of chambers in the Inns of Court, London.

Laundry-work has become an important industry, organized on a scale which requires elaborate mechanical plant very different from the simple appliances that once sufficed for domestic needs. For the actual cleansing of the articles, instead of being rubbed by the hand or trodden by the foot of the washerwoman, or stirred and beaten with a "dolly" in the wash-tub, they are very commonly treated in rotary washing machines driven by power. These machines consist of an outer casing containing an inner horizontal cylindrical cage, in which the clothes are placed. By the rotation of this cage, which is reversed by automatic gearing every few turns, they are rubbed and tumbled on each other in the soap and water which is contained in the outer casing and enters the inner cylinder through perforations. The outer casing is provided with inlet valves for hot and cold water, and with discharge valves; and often also arrangements are made for the admission of steam under pressure, so that the contents can be boiled. Thus the operations of washing, boiling, rinsing and bleaching (this last being the addition of a blue colouring matter to mask the yellow tint and thus give the linen the appearance of whiteness) can be performed without removing the articles from the machine. For drying, the old methods of wringing by hand, or by machines in which the clothes were squeezed between rollers of wood or India-rubber, have been largely superseded by hydro-extractors 1 or centrifugal machines. In these machines the clean clothes to be dried are placed in a large drum, or basket, supported on vertical bearings, which is rotated at a high speed (1000 to 1500 times a minute) and in a short time as much as 85% of the moisture may thus be removed. The drying is often completed in an apartment through which dry air is forced by fans. In the process of finishing linen the old-fashioned laundress made use of the mangle, about the only piece of mechanism at her disposal. In the box-mangle the articles were pressed on a flat surface by rollers which were weighted with a box full of stones, moved to and fro by a rack and pinion. In a later and less cumbersome form of the machine they were passed between wooden rollers or "bows" held close together by weighted levers. An important advance was marked by the introduction of machines which not only smooth and press the linen like the mangle, but also give it the glazed finish obtained by hot ironing. Machines of this kind are essentially the same as the calenders used in paper and textile manufacture. They are made in a great variety of forms, to enable them to deal with articles of different shapes, but they may be described generally as consisting either of a polished metal roller, heated by steam or gas, which works against a blanketeted or felted surface in the form of another roller or a flat table, or, as in the Decoudun type, of a felted metal roller rotating against a heated concave bed of polished metal. In cases where hand-ironing is resorted to, time is economized by the employment of irons which are continuously heated by gas or electricity.

LA UNION, a seaport and the capital of the department of La Union, Salvador, 144 m. E.S.E. of San Salvador. Pop. (1905) 4000. La Union is situated at the foot of a lofty volcano, variously known as Conchagua, Pinos and Meanguera, and on a broad indentation in the western shore of Fonseca Bay. Its harbour, the best in the republic, is secure in all weathers and affords good anchorage to large ships. La Union is the port of shipment for the exports of San Miguel and other centres of production in eastern Salvador.

LA UNION, a town of eastern Spain in the province of Murcia, 5 m. by rail E. of Cartagena and close to the Mediterranean Sea. Pop. (1900) 30,275, of whom little more than half inhabit the town itself. The rest are scattered among the numerous metal works and mines of iron, manganese, calamine, sulphur and lead, which are included within the municipal boundaries. La Union is quite a modern town, having sprung up in the second half of the 19th century. It has good modern municipal buildings, schools, hospitals, town hall and large factories.

LAURANTIA, a village of Germany, in the Prussian province of Silisia, 5 m. S.E. of Beuthen, on the railway Tarnowitz-Emunalsedgen. It has an Evangelical and a Roman Catholic church, but is especially noteworthy for its huge iron works, which employ about 6000 hands. Pop. (1900) 12,571.

LAUREATE (Lat. laureatus, from laurea, the laurel tree). The laurel, in ancient Greece, was sacred to Apollo, and as such was used to form a crown or wreath of honour for poets and heroes; and this usage has been widespread. The word "laureate" or "laureated" thus came in English to signify eminent, or associated with glory, literary or military. "Laureate letters" in old times meant the despatches announcing a victory; and the epithet was given, even officially (e.g. to John Skelton) by universities, to distinguished poets. The name of "bacca-laureate" for the university degree of bachelor shows a confusion with a supposed etymology from Lat. bacculae (the laurel berry), which though incorrect (see BACHELOR) involves the same idea. From the more general use of the term "poet laureate" arose its restriction in England to the office of the poet attached to the royal household, first held by Ben Jonson, for whom the position was, in its essentials, created by Charles I. in 1617. (Jonson's appointment does not seem to have been formally made as poet-laureate, but his position was equivalent to that). The office was really a development of the practice of earlier times, when minstrels and versifiers were part of the retinue of the King; it is recorded that Richard Cour de Lion had a versificator regis (Gulielmus Peregrinus), and Henry III. had a versificator (Master Henry); in the 13th century John Caeus (or the versificator) was described himself as Edward IV.'s "versificator" and "humble poet laureate." Moreover, the crown had shown its patronage in various ways; Chaucer had been given a pension and a perquisite of wine by Edward III., and Spenser a pension by Queen Elizabeth. W. Hamilton classes Chaucer, Gower, Kay, Andrew Bernard, Skelton, Robert Whittington, Richard Edwards, Spenser and Samuel Daniel, as "volunteer Laureates." Sir William Davenant succeeded Jonson in 1638, and the title of poet laureate was conferred by letters patent on Dryden in 1670, two years after Davenant's death, coupled with a pension of £300 and a butt of Canary wine. The post then became a regular institution, though the emoluments varied, Dryden's successors being T. Shadwell (who originated annual birthday and New Year odes), Nahum Tate, Nicholas Rowe, Laurence Eusden, Colley Cibber, William Whitehead, Thomas Warton, H. J. Pye, Southey, Wordsworth, Tennyson and, four years after Tennyson's death, Alfred Austin. The office took on a new lustre from the personal distinction of Southey, Wordsworth and Tennyson; it had fallen into contempt before Southey, and on Tennyson's death there was a considerable feeling that no possible successor was acceptable (William Morris and Swinburne being hardly court poets). Eventually, however, the undesirability of breaking with tradition for temporary reasons, and thus severing the one official link between literature and the state, prevailed over the protests against following Tennyson by any one of inferior genius. It may be noted that abolition was similarly advocated when Warton and Wordsworth died.

The poet laureate, being a court official, was considered
responsible for producing formal and appropriate verses on birthdays and state occasions; but his activity in this respect has varied, according to circumstances, and the custom ceased to be obligatory after Pye's death. Wordsworth stipulated, before accepting the honour, that no formal effusions from him should be considered a necessity; but Tennyson was generally happy in his numerous poems of this class. The emoluments of the post have varied; Ben Jonson first received a pension of 100 marks, and later an annual "terse of Canary wine." To Pye an allowance of £27 was made instead of the wine. Tennyson drew £72 a year from the lord chamberlain's department, and £27 from the lord steward's in lieu of the "butt of sack."

See Walter Hamilton's Poets Laureate of England (1879), and his contributions to Notes and Queries (Feb. 4, 1893).

**LAUREL.** At least four shrubs or small trees are called by this name in Great Britain, viz. the common or cherry laurel (*Prunus Laurocerasus*), the Portugal laurel (*P. tuscanica*), the bay or sweet laurel (*Laurus nobilis*) and the spurge laurel (*Daphne Laureola*). The first two belong to the rose family (*Rosaceae*), to the section *Coriaceae* to which also belong the cherry of the genus *Prunus*.

The common laurel is a native of the woody and sub-alpine regions of the Caucasus, of the mountains of northern Persia, of northern-western Asia Minor and of the Crimea. It was received into Europe in 1576, and flowered for the first time in 1583. Ray in 1688 relates that it was first brought from Trebizond to Constantinople, thence to Italy, France, Germany and England. Parkinson in his *Paradisus* records it as growing in a garden at Highgate in 1629; and in Johnson's edition of Gerard's *Herbal* (1633) it is recorded that the plant "is now got into many of our choice English gardens, where it is well respected for the beauty of the leaves and the lasting or continual greenesse" (see Loudon's *Arboratum*, ii. 717). The leaves of this plant are rather large, broadly lance-shaped and of a leathery consistence, the margin being somewhat serrated. They are remarkable for their poisonous properties, giving off the odour of bitter almonds when bruised; the vapour thus issuing is sufficient to kill small insects by the prussic acid which it contains. The leaves when cut up finely and distilled yield oil of bitter almonds and hydrocyanic (prussic) acid. Sweetmeats, custards, cream, &c. are often flavoured with laurel-leaf water, as it imparts the same flavour as bitter almonds; but it should be used sparingly, as it is a dangerous poison, having several times proved fatal. The first case occurred in 1731, which induced a careful investigation to be made of its nature; Schrader in 1802 discovered it to contain hydrocyanic acid. The effects of the distilled laurel-leaf water on living vegetables is to destroy them like ordinary prussic acid; while a few drops act on animals as a powerful poison. It was introduced into the British pharmacopoeia in 1839, but is generally superseded by the use of prussic acid. The *aqua laurocerasi*, or cherry laurel water, is now standardized to contain 0·1% of hydrocyanic acid. It must not be given in doses larger than 2 drachms. It contains benzole hydrate, which is antiseptic, and is therefore suitable for hypodermic injection; but the drug is of inconsistent strength, owing to the volatility of prussic acid.

The following varieties of the common laurel are in cultivation: the Caucasian (*Prunus Laurocerasus*, var. *cascaseca*), which is harderier and bears very rich dark-green glossy foliage; the Versailles laurel (var. *laifolia*), which has larger leaves; the Colchican (var. *colchica*), which is a dwarf-spreading bush with narrow sharply serrated pale-green leaves. There is also the variety *rotundifolia* with short broad leaves, the Grecian with narrow leaves and the Alexandrian with very small leaves.

The Portugal laurel is a native of Portugal and Madeira. It was introduced into England about the year 1648, when it was cultivated in the Oxford Botanic Gardens. During the first half of the 18th century this plant, the common laurel and the holly were almost the only hardly evergreen shrubs procurable in British nurseries. They are all three tender about Paris, and consequently much less seen in the neighbourhood of that city than in England, where they stand the ordinary winters but not very severe ones. There is a variety (*myrtifolia*) of compact habit with smaller narrow leaves, also a variegated variety.

The evergreen glossy foliage of the common and Portugal laurels render them well adapted for shrubberies, while the racemes of white flowers are not devoid of beauty. The former often ripens its insipid drupes, but the Portugal rarely does so. It appears to be less able to accommodate itself to the English climate, as the wood does not usually "ripen" so satisfactorily. Hence it is rather more liable to be cut by the frost. It is grown in the open air in the southern United States.

The bay or sweet laurel (*Laurus nobilis*) belongs to the family *Lauraceae*, which contains sassafras, benzoin, camphor and other trees remarkable for their aromatic properties. It is a large evergreen shrub, sometimes reaching the height of 60 ft., but rarely assuming a truly tree-like character. The leaves are smaller than those of the preceding laurels, possessing an aromatic and slightly bitter flavour, and are quite devoid of the poisonous properties of the cherry laurel. The small yellowish-green flowers are produced in axillary clusters, are male or female, and consist of a simple 4-leaved perianth which encloses nine stamens in the male, the anthers of which dehisce by valves which lift upwards as in the common barberry, and carry glandular processes at the base of the filament. The fruit consists of a succulent berry surrounded by the persistent base of the perianth. The bay laurel is a native of Italy, Greece and North Africa, and is abundantly grown in the British Isles as an evergreen shrub, as it stands most winters. The date of its introduction is unknown, but must have been previous to 1562, as it is mentioned in Turner's *Herbal* published in that year. A full description also occurs in Gerard's *Herball* (1597, p. 1222). It was used for strewing the floors of houses of distinguished persons in the reign of Elizabeth. Various species have been cultivated, differing in the character of their foliage, as the *undulata* or wave-leaved, *salicifolia* or willow-leaved, the variegated, the broad-leaved and the curled; there is also the double-flowered variety. The bay laurel was carried to North America by the early colonists.

This laurel is generally held to be the *Daphne* of the ancients, though Lindley, following Gerard (*Herball*, 1597, p. 761), asserted that the Greek *Daphne* was *Ruscus racemosus*. Among the Greeks the laurel was sacred to Apollo, especially in connexion with Tempe, in whose laurel groves the god himself obtained purification from the blood of the Python. This legend was dramatically represented at the Pythian festival once in eight years, a boy fleeing from Delphi to Tempe, and after a time being led back with song, crowned and adorned with laurel. Similar δαφνίαρια were known elsewhere in Greece. Apollo, himself purified, was the author of purification and atonement to other penitents, and the laurel was the symbol of this power, which came to be generally associated with his person and sanctuaries. The relation of Apollo to the laurel was expressed in the legend of *Daphne* (q.v.). The victors in the Pythian games were crowned with bay leaves, and such crowns symbolized the triumphs of moral and intellectual achievement. The laurel with its leaves used to adorn the head of the poet, the *Laurea Apollinaris* naturally belonged to poetic merit (see *LAUREATE*). The various prerogatives of the laurel among the ancients are collected by Pliny (*Hist. Nat.* xxv. 30). It was a sign of truce, like the olive branch; letters announcing victory and the arms of the victorious soldiery were garnished with it; it was thought that lightning could not strike it, and the emperor Tiberius always wore a laurel wreath during thunderstorms. From its association with the divine power of purification and protection, it was often set before the door of Greek houses, and among the Romans it was the guardian of the gates of the Caesars (*Ovid, Met.* 1. 562 sq.). The laurel worn by Augustus and his successors had a miraculous history: the laurel grove at the imperial villa by the ninth milestone on the Flaminian way sprang from a shoot sent from heaven to Livius Drusilla (*Sueton. Gaia*, 1). Like the olive, the laurel was forbidden to profane use. It was employed in divination; the cracking of its leaves in the sacred flame was a good omen (*Tibull.* ii. 5, 81).
and their silence unlucky (Propert. ii. 21); and the leaves when chewed excited a prophetic afflatus (δαφνικός, cf. Tibull. ii. 5. 63). There is a poem enumerating the ancient virtues of the laurel by J. Passeratius (1594).

The last of the plants mentioned above under the name of laurel is the so-called spurge laurel (Daphne Laureola). This and one other species (D. Mezeareum), the mezeeren, are the sole representatives of the family Thymelaeeaeae in Great Britain. The spurge laurel is a small evergreen shrub, with alternate somewhat lanceolate leaves with entire margins. The green flowers are produced in early spring, and form drooping clusters at the base of the leaves. The calyx is four-cleft, and carries eight stamens in two circles of four each within the tube. The pistil forms a berry, green at first, but finally black. The mezeeren differs in blossoming before the leaves are produced, while the flowers are lilac instead of green. The bark furnishes the drug Cortex Mezeriaei, for which that of the spurge laurel is often substituted. Both are powerfully acid, but the latter is less so than the bark of mezeeren. It is now only used as an ingredient of the liquor sacræ compositus concentratus. Of other species cultivated there are D. Fortunéi from China, which has lilac flowers; D. pontica, a native of Asia Minor; D. alpina, from the Italian Alps; D. collina, south European; and D. Mezeriwm, the garden flower or trailing daphne, the handsomest of the hardy species.

See Hemsley’s Handbook of Hardy Trees, &c.

**LAURENS, HENRY** (1724–1792), American statesman, was born in Charleston, South Carolina, on the 24th of February 1724, of Huguenot ancestry. When sixteen he became a clerk in a counting-house in London, and later engaged in commercial pursuits with great success at Charleston until 1771, when he retired from active business. He spent the next three years travelling in Europe and superintending the education of his sons in England. In spite of his strong attachment to England, and although he had defended the Stamp Act, in 1774, in the hope of averting war, he united with thirty-seven other Americans in a petition to parliament against the passing of the Boston Port Bill. Becoming convinced that a peaceful settlement was impracticable, he returned to Charleston at the close of 1774, and there allied himself with the conservative element of the Whig party. He was soon made president of the South Carolina council of safety, and in 1776 vice-president of the state; in the same year he was sent as a delegate from South Carolina to the general continental congress at Philadelphia, of which body he was president from November 1777 until December 1778. In August 1780 he started on a mission to negotiate on behalf of Congress a loan of ten million dollars in Holland; but he was captured on the 3rd of September off the Banks of Newfoundland by the British frigate "Vestal," taken to London and closely imprisoned in the Tower. His papers were found to contain a sketch of a treaty between the United States and Holland projected by William Lee, in the service of Congress, and Jan de Neufville, acting on behalf of Mynheer Van Berckel, pensionary of Amsterdam, and this discovery eventually led to war between the two countries. During his imprisonment his health became greatly impaired. On the 31st of December 1781 he was released on parole, and he was finally exchanged for Cornwallis. In June 1782 he was appointed one of the American commissioners for negotiating peace with Great Britain, but he did not reach Paris until the 28th of November 1782, only two days before the preliminaries of peace were signed by himself, John Adams, Franklin and Jay. On the day of signing, however, he procured the insertion of a clause prohibiting the British from "carrying away any negroes or other property of American inhabitants"; and this subsequently led to considerable friction between the British and American governments. On account of falling health he did not remain for the signing of the definitive treaty, but returned to Charleston, where he died on the 8th of December 1792.

His son, **JOHN LAURENS** (1754–1782), American revolutionary officer, was born at Charleston, South Carolina, on the 28th of October 1754. He was educated in England, and on his return to America in 1777, in the height of the revolutionary struggle, he joined Washington’s staff. He soon gained his commander’s confidence, which he reciprocated with the most devoted attachment, and was entrusted with the delicate duties of a confidential secretary, which he performed with much tact and skill. He was present in all Washington’s battles, from Brandywine to Yorktown, and his gallantry on every occasion has gained him the title of "the Bayard of the Revolution." Laurens displayed bravery even to rashness in the storming of the Chew mansion at Germantown; at Monmouth, where he saved Washington’s life, and was himself severely wounded; and at Coosathachie, where, with a handful of men, he defended a pass against a large English force under General Augustine Prevost, and was again wounded. He fought a duel against General Charles Lee, and wounded him, on account of that officer’s disrespectful conduct towards Washington. Laurens distinguished himself further at Savannah, and at the siege of Charleston in 1780. After the capture of Charleston by the English, he rejoined Washington, and was selected by him as a special envoy to appeal to the king of France for supplies for the relief of the American armies, which had been brought by prolonged service and scanty pay to the verge of dissolution. The more active co-operation of the French fleets with the land forces in Virginia, which was one result of his mission, brought about the disaster of Cornwallis at Yorktown. Laurens lost no time in rejoining the army, and at Yorktown was at the head of an American storming party which captured an advanced redoubt. Laurens was designated with the vicomte de Noailles to arrange the terms of the surrender, which virtually ended the war, although desultory skirmishing, especially in the South, attended the months of delay before peace was formally concluded. In one of these trifling affairs on the 27th of August 1782, on the Combahee river, Laurens exposed himself needlessly and was killed. Washington lamented deeply the death of Laurens, saying of him, "He had not a fault that I could discover, unless it were intrepidity bordering upon rashness."

The most valuable of Henry Laurens’s papers and pamphlets including the important "Narrative of the Capture of Henry Laurens," of his Conféments in the Tower of London, &c., 1780, 1781, 1782, in vol. i. (Charleston, 1857) of the Society’s Collections, have been published by Henri de Sainte-Beuve in 1875. The papers of Laurens’s correspondence, with a brief memoir by W. G. Simms, was privately printed by the Bradford Club, New York, in 1867.

**LAURENT, FRANÇOIS** (1810–1887), Belgian historian and jurisconsult, was born at Luxemburg on the 8th of July 1810. He held a high appointment in the ministry of justice for some time before he became professor of civil law in the university of Ghent in 1836. His advocacy of liberal and anti-clerical principles both from his chair and in the press made him bitter enemies, but he retained his position until his death on the 11th of February 1887. He treated the relations of church and state in L’Église et l’État (Brussels, 3 vols., 1858–1862; new and revised edition, 1865), and the same subject occupied a large proportion of the eighteen volumes of his chief historical work, Bruxelles, sur l’Histoire de Belgique (Brussels, 1875–1890), which aroused considerable interest beyond the boundaries of Belgium. His fame as a lawyer rests on his authoritative exposition of the Code Napoléon in his Principes de droit civil (Brussels, 33 vols., 1860–1878), and his Droit civil international (Brussels, 8 vols., 1880–1881). He was charged in 1879 by the minister of justice with the preparation of a report on the proposed revision of the civil code. Besides his anti-clerical pamphlets his minor writings include much discussion of social questions, of the organization of savings banks, asylums, &c., and he founded the Société Callier for the encouragement of thrift among the working classes. With Gustave Callier, whose funeral in 1863 was made the occasion of a display of clerical intolerance, Laurent had much in common, and the efforts of the society were directed to the continuation of Callier’s philanthropic schemes.

For a complete list of his works, see G. Koninck, Bibliographie nationale (Brussels, vol. ii., 1892).
LAURENTINA, VIA—LAURIA, ROGER DE

LAURENTINA, VIA, an ancient road of Italy, leading southwards from Rome. The question of the nomenclature of the group of roads between the Via Ardeatina and the Via Ostiensis is somewhat difficult, and much depends on the view taken as to the site of Laurentum. It seems probable, however, that the Via Laurentina proper is that which led out of the Porta Ardeatina of the Aurelian wall and went direct to Tor Paterno, while the road branching from the Via Ostiensis at the third mile, and leading past Decimo to Lavinium (Pratica), which crosses the other road at right angles not far from its destination (the Laurentina there running S.W. and that to Lavinium S.E.) may for convenience be called Lavatius, though this name does not occur in ancient times. On this latter road, beyond Decimo, two milestones, one of Tiberius, the other of Maxentius, each bearing the number 11, have been found; and farther on, at Capocotta, traces of ancient buildings, and an important sepulchral inscription of a Jewish ruler of a synagogue have come to light. That the Via Laurentina was near the Via Ardeatina is clear from the fact that the same contractor was responsible for both roads. Laurentum was also accessible by a branch from the Via Ostiensis at the eighth mile (at Malafede) leading past Castel Porziano, the royal hunting-lodge, which is identical with the ancient Ager Solonius (in which, Festus tells us, was situated the Pomonal or sacred grove of Pomonus) and which later belonged to Marius.

See R. Lanciani in articles quoted under LAVINUM. (T. As.)

LAURENTIUS, PAUL (1534-1624). Lutheran divine, was born on the 30th of March 1554 at Ober Wierau, where his father, of the same name, was pastor. From a school at Zwickau he entered (1573) the university of Leipzig, graduating in 1577. In 1578 he became rector of the Martin school at Halberstadt; in 1583 he was appointed town's preacher at Flauen-im-Vogtland, and in 1586 superintendent at Oelnitz. On the 20th of October 1595 he took his doctorate in theology at Jena, after which he was appointed (1597) to Wittenberg and Leipzig. He was promoted (1605) to be pastor and superintendent at Dresden, and transferred (1616) to the superintendence at Meissen, where he died on the 24th of February 1624. His works consist chiefly of commentaries and expository discourses on prophetical books of the Old Testament, parts of the Psalter, the Lord's Prayer and the history of the Passion. In two orations he compared Luther to Elijah. Besides theological works he was the author of a Spicilegium Gnomologicum (1612).

The main authority is C. Schlegel, the historian of the Dresden superintendents (1668), summarized by H. W. Rotterrund, in the additions (1810) to Jocher, Gelehrten Lexicon (1750). (A. G. G.)

LAURIA (LURIA or LORIA) ROGER DE (d. 1305), admiral of Aragon and Sicily, was the most prominent figure in the naval war which arose directly from the Sicilian Vespers. Nothing is really known of his life before he was named admiral in 1283. His father was a supporter of the Hohenstaufen, and his mother came to Spain with Costanza, the daughter of Manfred of Benevento, when she married Peter, the eldest son and heir of James the Conqueror of Aragon. According to one account Bella of Lauria, the admiral's mother, had been the foster mother of Costanza. Roger, who accompanied his mother, was bred at the court of Aragon and endowed with lands in the newly conquered kingdom of Valencia. When the misrule of Charles of Anjou's French followers had produced the famous revolt known as the Sicilian Vespers in 1282, Roger de Lauria accompanied King Peter III. of Aragon on the expedition which established the Kingdom of Sicily. This new kingdom of Tunis was designed to be an attempt to obtain possession of all or at least part of the Hohenstaufen dominions in Naples and Sicily which the king claimed by right of his wife as the heiress of Manfred. In 1283, when the island had put itself under the protection of Peter III. and had crowned him king, he gave the command of his fleet to Roger de Lauria. The commission speaks of him in the most laudatory terms, but makes no reference to previous military services.

From this time forward till the peace of Calatabellota in 1303, Roger de Lauria was the ever victorious leader of fleets in the service of Aragon, both in the waters of southern Italy and on the coast of Catalonia. In the year of his appointment he defeated a French naval force in the service of Charles of Anjou, off Malta. The main object before him was to repel the efforts of the Angevin party to reconquer Sicily and then to carry the war into their dominions in Naples. Although Roger de Lauria did incidental fighting on shore, he was as much a naval officer as any modern admiral, and his victories were won by good manœuvring and by discipline. The Catalan squadron, on which the Sicilian was moulded, was in a state of high and intelligent efficiency. Its chiefs relied not on merely boarding, and the use of the sword, as the French forces of Charles of Anjou did, but on the use of the ram, and of the powerful cross-bows used by the Catalans either by hand or, in case of the larger ones, mounted on the bulwarks, with great skill. The conflict was in fact the equivalent on the water of the battles between the English bowmen and the disorderly chivalry of France in the Hundred Years' War. In 1284 Roger defeated the Angevin fleet in the Bay of Naples, taking prisoner the heir to the kingdom, Charles of Salerno, who remained a prisoner in the hands of the Aragonese in Sicily, and later in Spain, for years. In 1285 he fought on the coast of Catalonia one of the most brilliant campaigns in all naval history. The French king Philippe le Hardi had invaded Catalonia with a large army to which the pope gave the character of crusaders, in order to support his cousin of Anjou in his conflict with the Aragonese. The king, Peter III., had offended his nobles by his vigorous exercise of the royal authority, and received little support from them, but the outrages perpetrated by the French invaders raised the towns and country against them. The invaders advanced slowly, taking the obdurate defended towns one by one, and relying on the co-operation of a large number of allies, who were stationed in squadrons along the coast, and who brought stores and provisions from Narbonne and Aigues Mortes. They relied in fact wholly on their fleet for their existence. A successful blow struck at that would force them to retreat. King Peter was compelled to risk Sicily for a time, and he recalled Roger de Lauria from Palermo to the coast of Catalonia. The admiral reached Barcelona on the 24th of August, and was informed of the disposition of the French. He saw that if he could break the centre of their line of squadrons, stretched as it was so far that its general superiority of numbers was lost in the attempt to occupy the whole of the coast, he could then dispose of the extremities in detail. On the night of the 9th of September he fell on the central squadron of the French fleet near the Hormigas. The Catalan and Sicilian squadrons doubled on the end of the enemy's line, and by a vigorous employment of the ram, as well as by the destructive shower of bolts from the cross-bows, which cleared the decks of the French, gained a complete victory. The defeat of the enemy was followed, as usually in medieval naval wars, by a wholesale massacre. Roger then made for Rosas, and tempted out the French squadron stationed there by approaching under French colours. In the open it was beaten in its turn. The result was the capture of the town, and of the stores collected there by King Philippe for the support of his army. Within a short time he was forced to retreat amid sufferings from hunger, and the incessant attacks of the Catalan mountaineers, by which his army was nearly annihilated. This campaign, which was followed up by destructive attacks on the French coast, saved Catalonia from the invaders, and completely ruined the French naval power for generations. No Catalans or Sicilians at Naples, in all the castles and towns, occupied an equal combination of intellect and energy, and none of modern times has surpassed it. The work had been so effectually done on the coast of Catalonia that Roger de Lauria was able to return to Sicily, and resume his command in the struggle of Aragonese and Angevins to gain, or to hold, the possession of Naples.

He maintained his reputation and was uniformly successful in his battles at sea, but they were not always fought for the defence of Sicily. The death of Peter III. in 1286 and of his
LAURIA—Laurier, eldest son Alphonso in the following year caused a division among the members of the house of Aragon. The new king, James, would have given up Sicily to the Angevine line with which he made peace and alliance, but his younger brother Fabrice accepted the crown offered him by the Sicilians, and fought for his own hand against both the Angevines and his senior. King James tried to force him to submission without success. Roger de Laurier adhered for a time to Fabrice, but his arrogant temper made him an intolerable supporter, and he appears, moreover, to have thought that he was bound to obey the king of Aragon. His large estates in Valencia gave him a strong reason for not offending that sovereign. He therefore left Fabrice, who confiscated his estates in Sicily and put one of his nephews to death as a traitor. For this Roger de Laurier took a ferocious revenge in two successive victories at sea over the Sicilians. When the war, which had become a ravaging of wild beasts, was at last ended by the peace of Calatella, Roger de Laurier retired to Valencia, where he died on the 2nd of January 1305, and was buried, by his express orders, in the church of Santas Creus, a now deserted monastery of the Cistercians, at the feet of his old master Peter III. In his ferocity, and his combination of loyalty to his feudal lord with utter want of scruple to all other men, Roger belonged to his age. As a captain he was far above his contemporaries and his successors for many generations.

Signor Amari's Guerra del Vespri Siciliano gives a general picture of the wars, but is dry work; that of his contemporaries, the Chronicae of the Catalan Ramon de Muntaner who knew him and was formed in his school. There is a very fair and well "documented" account of the masterly campaign of 1285 in Charles de la Roncière's Histoire de la marine française, i. 186-217. (D. H.)

LAURIA, or LORIA, a city of Basilicata, Italy, in the province of Potenza, situated near the borders of Calabria, 71 m. by road S. of Lagonegro. Pop. (1901) 10,470. It is a walled town on the steep side of a hill with another portion in the plain below, 1821 ft. above sea-level. The castle was the birthplace of Ruggiero di Loria, the great Italian admiral of the 13th century. It was destroyed by the French under Masséna in 1806.

Laurier, Sir Wilfrid (1841- ), Canadian statesman, was born on the 20th of November 1841, at St. Lin in the province of Quebec. The child of French Roman Catholic parents, he attended the elementary school of his native parish and for eight or nine months was a pupil of the Protestant elementary school at New Glasgow in order to learn English; his association with the Presbyterian family with whom he lived during this period had a permanent influence on his mind. At twelve years of age he entered L'Assumption college, and was there for seven years. The college, like all the secondary schools in Quebec then available was a Roman Catholic one, and was under direct ecclesiastical control. On leaving it he entered a law office at Montreal and took the law course at McGill University. At graduation he delivered the valedictory address for his class. This, like so many of his later utterances, closed with an appeal for sympathy and union between the French and English races as the secret of the future of Canada. He began to practise law in Montreal, but owing to ill-health soon removed to Athabaska, where he opened a law office and undertook also to edit Le Décideur, a newspaper then on the eve of collapse. At Athabaska, the seat of one of the superior courts of Quebec, the population of the district was fairly divided between French- and English-speaking people, and Laurier's career was undoubtedly influenced by his constant association with English-speaking people and his intimate acquaintance with their views and aspirations.

While at Montreal he had joined the Institut Canadien, a literary and scientific society which owing to its liberal discussions and the fact that certain books upon its shelves were on the Index expurgatorius, was finally closed down by the Roman Catholic authorities. Le Décideur was an organ of extreme French sentiment, opposed to confederation, and also under ecclesiastical censure. One of its few surviving copies contains an article by Laurier opposing confederation as a scheme designed in the interest of the English colonies in North America, and certain to prove the tomb of the French race and the ruin of Lower Canada. The Liberals of Quebec under the leadership of Sir Antoine Dorion were hostile to confederation, on at least to the terms of union agreed upon at the Quebec conference, and Laurier in editorials and speeches maintained the position of Dorion and his allies. He was elected to the Quebec legislature in 1871, and his first speech in the provincial assembly excited great interest, on account of its literary qualities and the attractive manner and logical method of the speaker. He was not less successful in the Dominion House of Commons, to which he was elected in 1874. During his first two years in the federal parliament his chief speeches were made in defence of Riel and the French half-breeds who were concerned in the Red River rebellion, and on fiscal questions. Sir John Macdonald, then in opposition, had committed his party to a protectionist policy, and Laurier, notwithstanding that the Liberal party stood for a low tariff, avowed himself to be "a moderate protectionist." He declared that if he were in Great Britain he would be a free trader, but that free trade or protection must be applied according to the necessities of a country, and that which protection necessarily involved taxation was the price a young and vigorous nation must pay for its development. But the Liberal government, to which Laurier was admitted as minister of inland revenue in 1877, made only a slight increase in duties, raising the general tariff from 15% to 17½%; and against the political judgment of Alexander Mackenzie, Sir Richard Cartwright, George Brown, Laurier and other of the more influential leaders of the party, it adhered to a low tariff platform. In the bye-election which followed Laurier's admission to the cabinet he was defeated—the only personal defeat he ever sustained; but a few weeks later he was returned for Quebec East, a constituency which he held thenceforth by enormous majorities. In 1878 his party went out of office and Sir John Macdonald entered upon a long term of power, with protection as the chief feature of his policy, to which he afterwards added the construction of the Canadian Pacific railway.

After the defeat of the Mackenzie government, Laurier sat in Parliament as the leader of the Quebec Liberals and first lieutenant to the Hon. Edward Blake, who succeeded Mackenzie in the leadership of the party. He was associated with Blake in his sustained opposition to high tariff, and to the Conservative plan for the construction of the Canadian Pacific railway, and was a conspicuous figure in the long struggle between Sir John Macdonald and the leaders of the Liberal party to settle the territorial limits of the province of Ontario and the legislative rights of the provinces under the constitution. He was forced also to maintain a long conflict with the ultramontane element of the Roman Catholic church in Quebec, which for many years had a close working alliance with the Conservative politicians of the province and even employed spiritual coercion in order to detach votes from the Liberal party. Notwithstanding that Quebec was almost solidly Roman Catholic the Rouges sternly resisted clerical pressure; they appealed to the courts and had certain elections voided on the ground of undue clerical influence, and at length persuaded the pope to send out a delegate to Canada, through whose inquiry into the circumstances the abuses were checked and the zeal of the ultramontanes restrained.

In 1887, upon the resignation of Blake on the ground of ill-health, Laurier became leader of the Liberal party, although he and many of the more influential men in the party doubted the wisdom of the proceeding. He was the first French Canadian to lead a federal party in Canada since confederation. Apart from the natural fear that he would arouse prejudice in the English-speaking provinces, the second Riel rebellion was then still stirring in the public mind and the future national agitation which Riel's execution had excited in Quebec had hardly subsided. Laurier could hardly have come to the leadership at a more inopportune moment, and probably he would not have accepted the office at all if he had not believed that Blake could be persuaded to resume the leadership when his health was restored. But from the first he won great popularity even in the English-speaking provinces, and showed unusual capacity for leadership. His party was beaten in the first general election
held after he became leader (1891), but even with its policy of unrestricted reciprocity with the United States, and with Sir John Macdonald still at the head of the Conservative party, it was beaten by only a small majority. Five years later, with unrestricted reciprocity relegated to the background, and with a platform which demanded tariff revision so adjusted as not to endanger established interests, and which opposed the federal measure designed to restore in Manitoba the separate or Roman Catholic schools which the provincial government had abolished, Laurier carried the country, and in July 1896 he was called by Lord Aberdeen, then governor-general, to form a government.

He was the first French-Canadian to occupy the office of premier; and his personal supremacy was shown by his long continuance in power. During the years from 1896 to 1910, he came to hold a position within the British Empire which was in its way unique, and in this period he had seen Canadian prosperity advance progressively by leaps and bounds. The chief features of his administration were the fiscal preference of 33 1/3% in favour of goods imported into Canada from Great Britain, the despatch of Canadian contingents to South Africa during the Boer war, the contract with the Grand Trunk railway for the construction of a second transcontinental road from ocean to ocean, the assumption by Canada of the imperial fortresses at Halifax and Esquimalt, the appointment of a federal railway commission with power to regulate freight charges, express rates and telephone rates, and the relations between competing companies, the reduction of the postal rate to Great Britain from 5 cents to 2 cents and of the domestic rate from 3 cents to 2 cents, a substantial contribution to the Pacific cable, a practical and courageous policy of settlement and development in the Western territories, the division of the North-West territories into the provinces of Alberta and Saskatchewan and the enactment of the legislation necessary to give them provincial status, and finally (1910), a tariff arrangement with the United States, which, if not all that Canada might claim in the way of reciprocity, showed how entirely the course of events had changed the balance of commercial interests in North America.

Laurier made his first visit to Great Britain on the occasion of Queen Victoria's diamond jubilee (1897) when he received the grand cross of the Bath; he then secured the denunciation of the Belgian and German treaties and thus obtained for the colonies the right to make preferential trade arrangements with the mother country. His personality made a powerful impression in Great Britain and also in France, which he visited before his return to Canada. His strong facial resemblance both to Lord Beaconsfield and to Sir John Macdonald marked him out in the public eye, and he captured attention by his charm of manner, fine command of scholarly English and genuine eloquence. Some of his speeches in Great Britain, coming as they did from a French-Canadian, and revealing delicate appreciation of British sentiment and thorough comprehension of the genius of British institutions, excited great interest and enthusiasm, while one or two impassioned speeches in the Canadian parliament during the Boer war profoundly influenced opinion in Canada and had a pronounced effect throughout the empire. As a skilled party-leader, Laurier kept from the first not only the affection of his political friends but the respect of his opponents; while enforcing the orderly conduct of public business, he was careful as first minister to maintain the dignity of parliament. In office he proved more of an opportunist than his career in opposition would have indicated, but his political courage and personal integrity remained beyond suspicion. His jealousy for the political autonomy of Canada was noticeable in his attitude at the Colonial conference held at the time of King Edward's coronation, and marked all his diplomatic dealings with the mother country. But he strove for sympathetic relations between Canadian and imperial authorities, and favoured general legislative and fiscal co-operation between the two countries. He strove also for good relations between the two races in Canada, and between Canada and the United States. Although he was classed in Canada as a Liberal, his tendencies would in England have been considered strongly conservative; an individualist rather than a collectivist, he opposed the intrusion of the state into the sphere of private enterprise, and showed no sympathy with the movement for state operation of railways, telegraphs and telephones, or with any kindred proposal looking to the extension of the obligations of the central government.

LAURISTON, JACQUES ALEXANDRE BERNARD LAW, MARQUIS DE (1768-1828), French soldier and diplomatist, was the son of Jacques Francois Law de Lauriston (1724-1755), a general officer in the French army, and was born at Pondicherry on the 1st of February 1768. He obtained his first commission about 1786, served with the artillery and on the staff in the earlier Revolutionary campaigns, and became brigadier of artillery in 1795. Resigning in 1796, he was brought back into the service in 1800 as aide-de-camp to Napoleon, with whom he was a cadet-Lauristin had been friendly terms. In the years immediately preceding the first empire Lauristin was successively director of the Le Fere artillery school and special envoy to Denmark, and he was selected to convey to England the ratification of the peace of Amiens (1802). In 1805, having risen to the rank of general of division, he took part in the war against Austria. He occupied Venice and Ragusa in 1806, was made governor-general of Venice in 1807, took part in the Erfurt negotiations of 1808, was made a count, served with the emperor in Spain in 1808-1809 and held commands under the viceroys Eugene Beauharnais in the Italian campaign and the advance to Vienna in the same year. At the battle of Wagram he commanded the guard artillery in the famous 'artillery preparation' which decided the battle. In 1811 he was made ambassador to Russia; in 1812 he held a command in the Grande Armée and won distinction by his firmness in covering the retreat from Moscow. He commanded the V. army corps at Lützen and Bautzen and the V. and X. I. in the autumn campaign, falling into battle on the 30th of November and being wounded at Leipzig. He was held a prisoner of war until the fall of the empire, and then joined Louis XVIII., to whom he remained faithful in the Hundred Days. His reward was a seat in the house of peers and a command in the royal guard. In 1817 he was created marquis and in 1823 marshal of France. During the Spanish War he commanded the corps which besieged and took Pamplona. He died at Paris on the 12th of June 1828.

LAURIUM (Λαύριον, mod. Ergastri), a mining town in Attica, Greece, famous for the silver mines which were one of the chief sources of revenue of the Athenian state, and were employed for coinage. After the battle of Marathon, Themi-stocles persuaded the Athenians to devote the revenue derived from the mines to shipbuilding, and thus laid the foundation of the Athenian naval power, and made possible the victory of Salamis. The mines, which were the property of the state, were usually farmed out for a certain fixed sum and a percentage on the working; slave labour was exclusively employed. Towards the end of the 6th century the output was diminished, partly owing to the Spartan occupation of Decelea. But the mines continued to be worked, though Strabo records that in his time the tailings were being worked over, and Pausanias speaks of the mines as a thing of the past. The ancient workings, consisting of shafts and galleries for excavating the ore, and pans and other arrangements for extracting the metal, may still be seen. The mines are still worked at the present day by French and Greek companies, but mainly for lead, manganese and cadmium. The population of the modern town was 10,007 in 1907.

LAURUM, a village of Houghton county, Michigan, U.S.A., near the centre of Keweenaw peninsula, the northern extremity of the state. Pop. (1890) 1159; (1900) 3642, of whom 2286 were foreign-born; (1904) 7653; (1910) 8537. It is served by
of the Mineral Range and the Mohawk and Copper Range railways. It is in one of the most productive copper districts in the United States, and copper mining is its chief industry. Immediately W. of Laurium is the famous Calumet and Hecla mine. The village was formerly named Calumet, and was incorporated under that name in 1889, but in 1895 its name was changed by the legislature to Laurium, in allusion to the mineral wealth of Laurium in Greece. The name Calumet is now applied to the post office in the village of Red Jacket (incorporated 1875; pop. 1900, 4668; 1904, 3784; 1910, 4211), W. of the Calumet and Hecla mine; and Laurium, the mining property and Red Jacket are all in the township of Calumet (pop. 1904, state census, 26,587).

LAURUS, in botany, the popular name of a common hardy evergreen garden shrub known botanically as Viburnum Tinus, with rather dark-green ovate leaves in pairs or flattened clusters (or corymbs) of white flowers, which are rose-coloured before expansion, and appear very early in the year. It is a native of the Mediterranean region, and was in cultivation in Britain at the end of the 17th century. Viburnum belongs to the natural order Caprifoliaceae and includes the common wayfaring tree (V. Laatusa) and the guelder rose (V. Opulus).

LAURIVIK, LAURIVIK or LAURIVG, a seaport of Norway, in Jarlsberg and Laurvik amt (county), at the head of a short fjord near the mouth of the Laugen river, 98 m. S.S.W. of Christiania by the Skien railway. Pop. (1900) 10,604. It has various industries, including saw and planing mills, shipbuilding, glassworks and factories for wood-pulp, barrels and potato flour; and an active trade in exporting timber, ice, wood-pulp and granite, chiefly to Great Britain, and in importing from the same country coal and salt. The port has a depth of 18 to 24 ft. beside the quays. Four miles south is Fredriksvaeren, formerly a station of the Norwegian fleet and the seat of a naval academy. Laurivik Bad is a favourite spa, with mineral and sulphur springs and mud-baths.

LAUSANNE, the capital of the Swiss canton of Vaud. It is the junction of the railway lines from Geneva, from Brieg and the Simplon, from Fribourg and Bern, and from Vallorbe (for Paris). A funicular railway connects the upper town with the central railway station and with Ouchy, the port of Lausanne on the lake of Geneva. Lausanne takes its name from the Flon stream flowing through it, which was formerly called Laus (water). The older or upper portion of the town is built on the crest and slopes of five hillocks and in the hollows between them, all forming part of the Jorat range. It has a picturesque appearance from the surface of the lake, above which the cathedral rises one hundred feet, while from the town there is a fine view across the lake towards the mountains of Savoy and of the Valais. The quaint characteristics of the hilly site of the old town have largely been destroyed by modern improvements, which began in 1836 and were not quite completed in 1910. The Grand Pont, designed by the cantonal engineer, Adrien Pichard (1790-1841), was built 1830-1844, while the Barre tunnel was pierced 1851-1855 and the bridge of Chauderon was built in 1905. The valleys and lower portions of the town were gradually filled up so as to form a series of squares, of which those of Ropine and of St Francois are the finest, the latter now being the real centre of the town. The railways were built between 1856 and 1862, while the opening of the Simplon tunnel (1906) greatly increased the commercial importance of Lausanne, which is now on the great international highway from Paris to Milan. From 1866 onwards a well-planned set of tramways within the town was constructed. The town is still rapidly extending, especially towards the south and west. Since the days of Gibbon (resident here for three periods, 1753-1758, 1763-1764 and 1783-1793), whose praises of the town have been often repeated, Lausanne has become a favourite place of residence for foreigners (including many English), who are especially attracted by the excellent establishments for secondary and higher education. Hence in 1900 there were 9,501 foreign residents (of whom 6,288 were British subjects) out of a total population of 46,732 inhabitants; in 1905 it was reckoned that these numbers had risen respectively to 10,625, 818 and 53,577. In 1790 it is said that the inhabitants numbered but 7,432 and 9,065 in 1803, while the numbers were 20,515 in 1860 and 33,340 in 1888. Of the population in 1900 the great majority was French-speaking (only 662 German-speaking and 3,146 Italian-speaking) and Protestant (964 Romanists and 473 Jews).

The principal building is the cathedral church (now Protestant) of Notre Dame, which with the castle occupies the highest position. It is the finest medieval ecclesiastical building in Switzerland. Earlier buildings were more or less completely destroyed by fire, but the present edifice was consecrated in 1775 by Pope Gregory X. in the presence of the emperor Rudolf of Hapsburg. It was sacked after the Bernese conquest (1536) and the introduction of Protestantism, but many ancient tapestries and other precious objects are still preserved in the Historical Museum at Bern. The church was well restored at great cost from 1873 onwards, as it is the great pride of the citizens. Close by is the castle, built in the early 15th century by the bishops, later the residence of the Bernese bailiffs and now the seat of the various branches of the administration of the canton of Vaud. Near both is the splendid Palais de Rumine (on the Place de la Riponne), opened in 1906 and now housing the university as well as the cantonal library, the cantonal picture gallery (or Musée Arlaud, founded 1841) and the cantonal collections of archaeology, natural history, &c. The university was raised to that rank in 1890, but, as an academy, dates from 1537. Among its former teachers may be mentioned Theodore Beza, Conrad Gesner, J. P. de Crousaz, Charles Monnard, Alexandre Vinet, Eugène Rambert, Juste Olivier and several members of the Secretan family. On the Montbenon heights to the south-west of the cathedral group is the federal palace of justice, the seat (since 1886) of the federal court of justice, which, erected by the federal constitution of 26th May 1874, was fixed at Lausanne by a federal resolution of 26th June 1874. The house, La Grotte, which Gibbon inhabited 1783-1793, and on the terrace of which he completed (1787) his famous history, was demolished in 1866 to make room for the new post office that stands on the Place St François. The asylum for the blind was mainly founded (1845) by the generosity of W. Haldimand, an Englishman of Swiss descent. The first book printed in Lausanne was the missal of the cathedral church (1403), while the Gazette de Lausanne (founded 1798) took that name in 1804. Lausanne has been the birthplace of many distinguished men, such as Benjamin Constant, the Secretans, Vinet and Rambert. It is the seat of many benevolent, scientific and literary societies and establishments.

The original town (mentioned in the Antonine Itinerary) was on the site of the modern place Lavaux, near the city, south-west of the present city. It was burnt in the 4th century by the Alamanni. Some of the inhabitants took refuge in the hills above and there founded a new town, which acquired more importance when Bishop Murius about 590 chose it as his see city (perhaps transferring it from Avanches). Here rose the cathedral church, the bishop's palace, &c. Across the Flon was a Burgundian settlement, later known as the Bourg, while to the west was a third colony around the church of St Laurent. These three elements joined together to form the present city. The bishops obtained little by little great temporal powers (the diocese extended to the left bank of the Aar) and riches, becoming in 1125 princes of the empire, while their chapter was recruited only from the noblest families. But in 1368 the bishop was forced to recognize various liberties and customs that had been gradually won by the citizens, the Fluid General of that year showing that there was already some kind of municipal government, save for the cite, which was not united with the ville inférieure or the other four quartiers (Bourg, St Laurent, La Palud and Le Pont) in 1481. In 1525 the city made an alliance with Bern and Fribourg. But in 1536 the territory of the bishop (as well as the Savoyard barony of Vaud) was forcibly conquered by the Bernese, who at once introduced Protestantism. The Bernese occupation lasted till 1798, though in 1723 an attempt was made to put an end to it by Major Davel, who lost his life in consequence. In 1798 Lausanne became a simple prefecture of the canton Léman.
of the Helvetic republic. But in 1803, on the creation of the canton of Vauban by the Act of Mediation, it became its capital. The bishop of Lausanne resided after 1663 at Fribourg, while from 1821 onwards he added "and of Geneva" to his title.

Besides the general works dealing with the canton of Vauban (q.v.), the following books refer specially to Lausanne: A. Bernus, L'imprimerie à Lausanne et à Morges jusqu'à la fin du 16ème siècle (Lausanne, 1904); M. E. Bouvier, Recherches sur les origines de Genève et de Lausanne, Sion (Fribourg, 1866); A. Bonnard, "Lausanne au 18ème siècle," in the work entitled Chez nos aieux (Lausanne, 1902); E. Dupraz, La Cathédrale de Lausanne . . . étude historique (Lausanne, 1866); E. Gorgine and F. Forel, Documents concernant l'ancien évêché de Lausanne, 2 parts (Lausanne, 1846-1847); J. H. Lewis and F. Gribble, Lausanne (1699); E. van Muyden and others, Lausanne à travers les siecles, 4 vols. (Lausanne, 1850-1853); C. Perret, Les débuts de Lausanne, 2 vols. (Fribourg, 1857); M. Schmid, Mémoires historiques sur la duchesse de Lausanne (2 vols., Fribourg, 1859); J. Stammmer (afterwards bishop of Lausanne), Le Frère de la cathédrale de Lausanne (Lausanne, 1862; trans. of a German book of 1804).

Lautrec—Lava

Lautrec, Odet de Foix, Vicomte de (1458-1528), French soldier. The branch of the viscounts of Lautrec originated with Pierre, the grandson of Archambaud de Grailly, capitain de Buch, who came into possession of the county of Foix in 1401. Odet de Foix and his two brothers, the seigneur of Lesuen and the seigneur of l'Esparr, served Francis I. as captains; and the influence of their sister, Françoise de Châteaubriant, who became the king's mistress, gained them high offices. In 1515 Lautrec took part in the campaign of Marignano. In 1516 he received the government of the Milanese, and by his severity made the French domination insupportable. In 1521 he succeeded in defending the duchy against the Spanish army, but in 1522 he was conclusively defeated at the battle of the Bicocca, and was forced to evacuate the Milanese. The mutiny of his Swiss troops had compelled him, against his wish, to engage in the battle. A cartel of French, he received again, in 1527, the command of the army of Italy, occupied the Milanese, and was then sent to undertake the conquest of the kingdom of Naples. The defection of Andrea Doria and the plague which broke out in the French camp brought on a fresh disaster. Lautrec himself caught the infection, and died on the 15th of August 1528. He had the reputation of a gallant and able soldier, but this reputation scarcely seems to be justified by the facts; though he was always badly used by fortune.

Lauzun, Antonin Nompar de Caumont, Marquis de Peuguilhem. Duc de (1632-1723), French courtier and soldier, was the son of Gabriel de La Force, and his wife Charlotte, daughter of the duc de La Force. He was brought up with the children of his kinsman, the maréchal de Gramont, of whom the comte de Guiche became the lover of Henrietta of England, duchess of Orleans, while Charlotte Catherine, afterwards princess of Monaco, was the object of the one passion of Lauzun's life. He entered the army, and served under Turenne, also his kinsman, and in 1655 succeeded his father as commander of the centi gentilshommes de la maison de roi. Puyguilhem (or Péguilin, as contemporaries simplified his name) rapidly rose in Louis XIV.'s favour, became colonel of the royal regiment of dragoons, and was gazetted maréchal de camp. He and Mme de Monaco belonged to the coterie of the young duchess of Orleans. His rough wit and skill in practical jokes pleased Louis XIV., but his jealousy was the cause of his downfall. He promoted a meeting between Louis XIV. and Mme de Monaco, and it was jealousy in this matter, rather than hostility to Louise de la Vallière, which led him to promote Mme de Montespan's intrigues with the king. He asked this lady to secure for him the post of grand-master of the artillery, and on Louis's refusal to give him the appointment he turned his back on the king, broke his sword, and swore that never again would he serve a monarch who had broken his word. The result was a short sojourn in the Bastille, but he soon returned to his functions of court buffoon. Meanwhile, the duchess of Montepensier (la Grande Mademoiselle) had fallen in love with the little man, whose ugliness seems to have exercised a certain fascination over many women. He naturally encouraged one of the greatest heiresses in Europe, and the wedding was fixed for the 20th of December 1670, when on the 18th Louis sent for his cousin and forbade the marriage. Mme de Montespan had never forgiven his fury when she failed to procure the grand-mastership of the artillery, and now, with Louvois, secured his arrest. He was removed in November 1671 from the Bastille to Pignerol, where excessive precautions were taken to ensure his safety. He was eventually allowed free intercourse with Fouquet, but before that time he managed to find a way through the chimney into Fouquet's room, and on another occasion succeeded in reaching the courtyard in safety. Another fellow-prisoner, from communication with whom he was supposed to be rigorously excluded, was Eustache Dauger (see Iron Mask).

It was now intimate to Mademoiselle that Lauzun's restoration to liberty depended on her immediate settlement of the principality of Dombes, the county of Eu and the duchy of Aumale—three properties assigned by her to Lauzun—on the little duc de Maine, eldest son of Louis XIV. and Mme de Montespan. She gave way, but Lauzun, even after ten years of imprisonment, refused to sign the documents, when he was brought to Bourbon for the purpose. A short time in imprisonment at Chalon-sur-Sûne made him change his mind, but when he was set free Louis XIV. was still set against the marriage, which is supposed to have taken place secretly (see Montepensier). Married or not, Lauzun was openly courting Fouquet's daughter, whom he had seen at Pignerol. He was to be restored to his place at court, and to marry Mme Fouquet, who, however, became Mme d'Uzès in 1683. In 1685 Lauzun went to England to seek his fortune under James II., whom he had served as duke of York in Flanders. He rapidly gained great influence at the English court. In 1688 he was again in England, and arranged the flight of Mary of Modena and the infant prince, whom he accompanied to Calais, where he received strict instructions from Louis to bring them "on any pretext" to Vincennes. In the late autumn of 1689 he was put in command of the expedition fitted out at Brest for service in Ireland, and he sailed in the following year. Lauzun was honest, a quality not too common in James II.'s officials in Ireland, but had no experience of the field, and he blindly followed Richard Talbot, earl of Tyrconnel. After the battle of the Boyne they fled to Ireland, and then to the west coast, where they aimed to show a brave front. In September they sailed for France, and on their arrival at Versailles Lauzun found that his failure had destroyed any prospect of a return of Louis XIV.'s favour. Mademoiselle died in 1693, and two years later Lauzun married Geneviève de Durfort, a child of fourteen, daughter of the maréchal de Lorges. Mary of Modena, through whose interest Lauzun secured his dukedom, retained her faith in him, and it was he who in 1715, more than a quarter of a century after the flight from Whitehall, brought her the news of the disaster of Sheriffmuir. Lauzun died on the 19th of November 1723. The duchy fell to his nephew, Armand de Gontaut, comte de Brion.

The letters of Mme de Sévigné, the memoirs of Saint-Simon, who was Lauzun's wife's brother-in-law; also J. Lair, Nicolas Fouquet, vol. ii. (1890); Martin Hailes, Mary of Modena (1905), and M. F. Sandars, Lauzun, Courtier and Adventurer (1908).

Lava, an Italian word (from Lat. lavare, to wash) applied to the liquid products of volcanic activity. Streams of rainwater, formed by condensation of exhaled steam often mingled with volcanic ashes so as to produce mud, are known as lava d'acqua, whilst the streams of molten matter are called lava di fuoco. The term lava is applied by geologists to all matter of volcanic origin, which is, or has been, in a molten state. The magma, or molten lava in the interior of the earth, may be regarded as a mutual solution of various mineral silicates, charged with highly-heated vapour, sometimes to the extent of supersaturation. According to the proportion of silica, the lava is distinguished as "acid" or "basic." The basic lavas are...
usually darker and denser than lavas of acid type, and when fused they tend to flow to great distances, and may thus form far-spreading sheets, whilst the acid lavas, being more viscous, rapidly consolidate after extrusion. The lava is emitted from the volcanic vent at a high temperature, but on exposure to the air it rapidly consolidates superficially, forming a crust which in many cases is broken up by the continued flow of a subjacent liquid lava, so that the surface becomes riddled with clinkers. J. D. Dana introduced the term "aa" for this rough kind of lava-stream, whilst he applied the term "pahoehoe" to those flows which have a smooth surface, or are simply wrinkled andropy; these terms being used in this sense in Hawaii, in relation to the local lavas. The different kinds of lava are more fully described in the article VOLCANO.

LAVABO (Lat. "I will wash"); the Fr. equivalent is lavoir), in ecclesiastical usage, the term for the washing of the priests' hands, at the celebration of the Mass, at the offertory. The words of Psalm xxvi. 6, Lavabo inter innocentes manus meas, are said during the rite. The word is also used for the basin employed in the ritual washing, and also for the lavatories, generally erected in the cloisters of monasteries. Those at Gloucester, Norwich and Lincoln are best known. A very curious example is the large circular basin, supported on a pillar, is given by Viollet-le-Duc. In general the lavabo is a sort of trough; in some places it has an almsry for tţles, &c.

LAVAGNA, a seaport of Liguria, Italy, in the province of Genoa, from which it is 253 m. S.E. by rail. Pop. (1901) 7005. It has a small shipbuilding trade, and exports great quantities of slate (lavagna, taking its name from the town). It also has a large cotton-mill. It was the seat of the Fieschi family, independent counts, who, at the end of the 12th century, were obliged to recognize the supremacy of Genoa. Sinibaldo Fieschi was Pope Innocent IV. (1243-1254), and Haden V. (1276) was also a Fieschi.

LAVAL, ANDRÉ DE, SEIGNEUR DE LOHÉAC (c. 1408-1458), French soldier. In 1423 he served in the French army against England, and in 1428 was taken prisoner by John Talbot, 1st earl of Shrewsbury, after the capitulation of Laval, which he was defending. After paying his ransom he was present with Joan of Arc at the siege of Orleans, at the battle of Patay, and at the coronation of Charles VII. He was made admiral of France in 1437 and marshal in 1439. He served Charles VII. faithfully in all his wars, even against the dauphin (1456), and when the latter became king as Louis XI., Laval was dismissed from the marshal's office. After the War of the Public Weal he was restored to favour, and recovered the marshal's bâton, the king also granting him the offices of lieutenant-general to the government of Paris and governor of Picardy, and conferring on him the collar of the order of St Michael. In 1472 Laval was successful in resisting the attacks of Charles the Bold, duke of Burgundy, on Beauvais.

LVAL, a town of north-western France, capital of the department of Mayenne, on the Mayenne river, 188 m. W.S.W. of Paris by rail. Pop. (1906) 24,574. On the right bank of the river, the former feudal city, with its ancient castle and its irregularly built houses whose slate roofs and pointed gables peep from the groves of trees which clothe the hill. On the left bank the regularly built new town extends far into the plain. The river, here 80 yds. broad, is crossed by the handsome railway viaduct, a beautiful stone bridge called Pont Neuf, and the Pont Vieux with three pointed arches, built in the 16th century. There is communication by steamer as far as Angers. Laval may justly claim to be one of the loveliest of French towns. Its most curious and interesting monument is the sombre old castle of the counts (now a prison) with a donjon of the 12th century, the roof of which presents a fine example of the timber-work superseded afterwards by stone mastication. The "new castle," dating partly from the Renaissance, serves as court-house. Laval possesses several churches of different periods: in that of the Trinity, which serves as the cathedral, the transept and nave are of the 12th century while the choir is of the 16th; St Vénérant (15th century) has good stained glass; Notre-Dame des Cordeliers, which dates from the end of the 14th century or the beginning of the 15th, has some fine marble altars. Half-a-mile below the Pont Vieux is the beautiful 12th-century church of Avenières, with an ornamental spire of 1534. The finest remaining relic of the ancient fortification is the Boucheuse gate now the cathedral. The narrow streets around the castle are bordered by many old houses of the 15th and 16th century, chief among which is that known as the "Maison du Grand Veneur." There are an art-museum, a museum of natural history and archaeology and a library. The town is embellished by fine promenades, at the entrance of one of which, facing the marble, stands the statue of the celebrated surgeon Ambroise Paré (1517-1590). Laval is the seat of a prefect, a bishopric created in 855, and a court of assizes, and has tribunals of first instance and of commerce, a chamber of commerce, a board of trade-arbitrators, training colleges, an ecclesiastical seminary and a lycée for boys. The principal industry of the town is the cloth manufacture, introduced from Flanders in the 14th century. The production of fabrics of linen, of cotton or of mixtures of both, occupies some 10,000 hands in the town and suburbs. Among the numerous other industries are metal-founding, flour-milling, tanning, dyeing, and the making of the marble quarried in the vicinity. There is trade in grain.

Laval is not known to have existed before the 9th century. It was taken by John Talbot, earl of Shrewsbury, in 1428, changed hands several times during the wars of the League, and played an important part at the end of the 18th century in the war of La Vendée.

SEIGNEURS AND COURTS OF LAVAL. The castle of Laval was founded at the beginning of the 11th century by a lord of the name of Guy, and remained in the possession of his male descendants until the 13th century. In 1218 the lordship passed to the house of Montmorency by the marriage of Emma, daughter of Guy VI. of Laval, to Mathieu de Montmorency, the hero of the battle of Bouvines. Of this union was born Guy VII. seigneur of Laval, the ancestor of the second house of Laval. Anne of Laval (d. 1460), the heiress of the second family, married John de Montfort, who took the name of Guy (XIII.) of Laval. At Charles VII.'s coronation (1429) Guy XIV., who was afterwards son-in-law of John V., duke of Brittany, and father-in-law of King René of Anjou, was created count of Laval, and the countyship remained in the possession of Guy's male descendants until 1547. After the Montforts, the countyship of Laval passed by inheritance to the families of Rieux and Sainte Maure, to the Colignys, and finally to the La Trémoilles, who held it until the Revolution.

See Bertrand de Brousson, La Maison de Laval (3 vols., 1895-1900).

LA VALLIÈRE, LOUISE FRANÇOISE DE (1644-1710), mistress of Louis XIV., was born at Tours on the 6th of August 1644, the daughter of an officer. Laurent de la Baume le Blanc, who took the name of La Vallière from a small property near Amboise. La Vallière died in 1621; his widow, who soon married again, joined the court of Gaston d'Orléans at Blois. Louise was brought up with the younger princesses, the step-sisters of La Grande Mademoiselle. After Gaston's death his widow moved with her daughters to the palace of the Luxembourg in Paris, and with them went Louise, who was now a girl of sixteen. Through the influence of a distant kinswoman, Mme de Choisy, she was named maid of honour to Henrietta of England, who was about her own age and had just married Philip of Orleans, the king's brother. Henrietta joined the court at Fontainebleau, and was soon on the friendliest terms with her brother-in-law, so friendly indeed that there was some scandal, to avoid which it was determined that Louis should pay marked attentions elsewhere. The person selected was Madame's maid of honour, Louise. She had been only two months in Fontainebleau before she became the king's mistress. The affair, begun on Louis's part as a blind, immediately developed into real passion on both sides. It was Louise's first serious attachment, and Louise was an innocent, religious-minded girl, who brought
neither curiosity nor self-interest to their relation, which was sedulously concealed. Nicolas Fouquet's curiosity in the matter was one of the causes of his disgrace. In February 1662 there was a storm when Louise refused to tell her lover the relations between Madame (Henrietta) and the comte de Guiche. She fled to an obscure convent at Chaillot, where Louis rapidly followed her. Her enemies, chief of whom was Olympe Mancini, comtesse de Soissons, Mazarin's niece, sought her downfall by bringing her liaison to the ears of Queen Maria Theresa. She was presently removed from the service of Madame, and established in a small building in the Palais Royal, where in December 1663 she gave birth to a son Charles, who was given in charge to two faithful servants of Colbert. Concealment was practically abandoned after her return to court, and she made a brilliant début of August 1664. La Vallière appeared at mass side by side with Maria Theresa. But her favour was already waning. She had given birth to a second child in January 1665, but both children were dead before the autumn of 1666. A daughter born at Vincennes in October 1666, who received the name of Marie Anne and was known as Mille de Blois, was publicly recognized by Louis as his daughter in letters-patent making the mother a duchess in May 1667 and conferring on her the estate of Vaugours. In October of that year she bore a son, but by this time her place in Louis's affections was definitely usurped by Athénaïs de Montespan (q.v.), who had long been plotting against her. She was compelled to remain at court as the king's official mistress, and even to share Mme de Montespan's apartments at the Tuileries. It was only when she was sent to a convent by Madame de Chaillot, only to be compelled to return. In 1674 she was finally permitted to enter the Carmelite convent in the Rue d'Enfer. She took the final vows a year later, when Bossuet pronounced the allocution.

Her daughter married Armand de Bourbon, prince of Conti, in 1680. The count of Vermandois, her youngest born, died on his first campaign at Courtrai in 1683. La Vallière's Réflexions sur la mission de Dieu, written after her retreat, were printed by Lequeux in 1757, and in 1860 Réflexions, lettres et sermons, by M. P. Clement (2 vols.). Some apocryphal Mémoires appeared in 1829, and the Lettres de Mme la duchesse de la Vallière (1769) are a corrupt version of her correspondence with the maréchal de Bellefond. Of modern works on the subject see Arène Houssaye, Mme de la Vallière et Mme de Montespan (1860): Jules Lair, Louise de la Vallière (3rd ed., 1902, Eng. trans., 1908); and C. Bonnet, Documents inédits sur Mme de la Vallière (1904).

LAVATER, JOHANN KASPAR (1741-1801), German poet and physiognomist, was born at Zürich on the 15th of November 1741. He was educated at the gymnasium of his native town, where J. Bodmer and J. J. Breitinger were among his teachers. When barely one-and-twenty he greatly distinguished himself by denouncing, in conjunction with his friend, the painter H. Fuseli, an iniquitous magistrate, who was compelled to make restitution of his ill-gotten gains. In 1769 Lavater took orders, and officiated till his death as deacon or pastor in various churches in his native city. His oratorical fervour and genuine depth of conviction gave him great prestige, and he was consulted as a casuist, and was welcomed with demonstrative enthusiasm in his numerous journeys through Germany. His mystical writings were also widely popular. Scarcely a trace of this influence has remained, and Lavater's name would be forgotten but for his work on physiognomy, Physiognomische Fragmente zur Beförderung der Menschenkenntnis und Menschenliebe (1775-1778). The fame even of this book, which found enthusiastic admirers in France and England, as well as in Germany, rests to a great extent upon the handsome style of publication and the accompanying illustrations. It left, however, the study of physiognomy (q.v.), as desultory and unscientific as it found it. As a poet, Lavater published Christliche Lieder (1776-1780) and two epics, Jesus Messiah (1780) and Joseph von Arimathia (1794), the latter in the style of Klopstock. More important and the characteristic of the religious temperament of Lavater's age is his introspective Ausstinent in die Einigkeit (4 vols., 1768-1778); Geheimes Tagebuch von einem Beobachter seiner selbst (2 vols., 1772-1773) and Pontius Pilatus, oder der Mensch in allen Gestalten (4 vols., 1782-1785). From 1774 on, Goethe was intimately acquainted with Lavater, but at a later period he became estranged from him, somewhat abruptly accusing him of superstition and hypocrisy. Lavater had a mystic's indifference to historical Christianity, and, although esteemed by himself and others a champion of orthodoxy, was in fact only an antagonist of rationalism. During the later years of his life his influence waxed, and he incurred ridicule by some exhibitions of vanity. He redeemed himself by his patriotic conduct during the French occupation of Switzerland, which brought about his tragic death. On the taking of Zürich by the French in 1799, Lavater, while endeavouring to appease the soldiery, was shot publicly by the body of the Agout. He bore the sufferings borne with great fortitude, on the 2nd of January 1801. Lavater himself published two collections of his writings, Vermischte Schriften (2 vols., 1774-1781), and kleinere prosaische Schriften (3 vols., 1784-1785). His Nachgelassene Schriften were edited by G. Gessner (5 vols., 1801-1802); Sämtliche Werke (but only poems) (6 vols., 1836-1838); Ausgewählte Schriften (8 vols., 1841-1844). See G. Gessner, Lavaters Lebensbeschreibung (3 vols., 1802-1803); U. Hegner, Beiträge zur Kenntnis Lavaters (1836); F. Ewigkeil, Johann Lavater in sein Leben und Werk (1856); 2nd ed., 1877); F. Müncker, J. K. Lavater (1883); H. Waser, J. K. Lavater nach Georgs Aufzeichnungen (1894); J. K. Lavater, Denkschrift zum 200. Todejahr (1902).

LAVAU, a town of south-western France, capital of an arrondissement in the department of Tarn, 37 m. S.E. of Montauban by rail. Pop. (1906), town 4069; commune 6385. Lavau stands on the left bank of the Agout, which is here crossed by a railway-bridge and a fine stone bridge of the late 18th century. From 1317 till the Revolution Lavau was the seat of a bishopric, and there is a cathedral dating from the 13th, 14th and 15th centuries, with an octagonal bell-tower; a second smaller square tower contains a jauge-mart (a statute which strikes the hours with a hammer) of the 16th century. In the bishop's garden is the statue of Emmanuel Augustin, marquis de Las Cases, one of the companions of Napoleon at St Helena. The town carries on distilling and flour-milling and the manufacture of brushes, pasteboard and wooden shoes. There are a suprefecture and tribunal of first instance. Lavau was taken in 1211 by Simon de Montfort during the wars of the Albigeois, and several times during the religious wars of the 16th century.

LAVEDAN, HENRI LÉON ÉMILE (1859— ), French dramatist and man of letters, was born at Orléans, the son of Hubert Léon Lavedan, a well-known Catholic and liberal journalist. He contributed to various Parisian papers a series of witty tales and dialogues of Parisian life, many of which were collected in volume form. In 1891 he produced at the Théâtre Français Une Famille, followed at the Vaudeville in 1894 by Le Prince d'Auray, a satire on the nobility, afterwards re-named Les Descendants. Later brilliant and witty pieces were Les Deux noblesses (1897), Catherine (1897), Le Nouveau jeu (1898), Le Vieux marcheur (1899), Le Marquis de Priola (1902), and Venusse (1904), written in collaboration with G. Desvignes. He had a great success with Le Duel (Comédie Française, 1905), a powerful psychological study of the relations of two brothers. Lavedan was admitted to the French Academy in 1898.

LAVELEYE, ÉMILE LOUIS VICTOR DE (1822-1892), Belgian economist, was born at Bruges on the 5th of April 1822, and educated there and at the Collège Stanislas in Paris, a celebrated establishment in the hands of the Oratorians. He continued his studies at the Catholic university of Louvain and afterwards at Ghent, where he came under the influence of François Huet, the philosopher and Christian Socialist. In 1844 he won a prize with an essay on the language and literature of Provence. In 1847 he published L'Histoire des rois francs, and in 1861 a French translation of Gesner's Creation, under the title of Quelle est l'antiquité de l'humanité? He thus conceived in his interest in literature and history, his most important work was in the domain of economics. He was one of a group of young lawyers, doctors and critics, all old pupils of Huet, who met once a week to discuss social and economic questions, and was thus led to
publish his views on these subjects. In 1859 some articles by him in the 'Revue des deux mondes' laid the foundation of his reputation as an economist. In 1864 he was elected to the chair of political economy at the state university of Liége. Here he wrote his most important works: 'La Russie et l'Autriche depuis Sadowa' (1872), 'Essai sur les formes de gouvernement dans les sociétés modernes' (1872), 'Des Causes actuelles de guerre en Europe et de l'arbitrage' and 'De la propriété et de ses formes primitives' (1874), dedicated to the memory of John Stuart Mill and François Huet. He died at Doyon, near Liége, on the 3rd of January 1892. Laveleye's name is particularly connected with bimetallism and primitive property, and he took a special interest in the revival and preservation of small nationalities. But his activity included the whole realm of political science, political economy, monetary questions, international law, foreign and Belgian politics, questions of education, religion and morality, travel and literature. He had the art of popularizing even the most technical subjects, owing to the clearness of his view and his firm grasp of the matter in hand. He was especially attracted to England, where he thought he saw many of his ideals of social, political and religious progress realized. He was a frequent contributor to the English newspapers and leading reviews. The most widely circulated of his works was a pamphlet on Le Parti clérical en Belgique, of which 2,000,000 copies were circulated in ten languages.

**LAVENDER.** botanically *Lavandula*, a genus of the natural order Labiatae distinguished by an ovate tubular calyx, a two-lipped corolla, of which the upper lip has two and the lower three lobes, and four stamens bent downwards.

The plant to which the name of lavender is commonly applied, *Lavandula vera*, is a native of the mountainous districts of the countries bordering on the western half of the Mediterranean, extending from the eastern coast of Spain to Calabria and northern Africa, growing in some places at a height of 4500 ft. above the sea-level, and preferring stony declivities in open situations. It is cultivated in the open air as far north as Norway and Livonia. Lavender forms an evergreen under-shrub about 2 ft. high, with greyish-green hoary linear leaves, rolled under at the edges when young; the branches are erect and give a bushy appearance to the plant. The flowers are borne on a terminal spike at the summit of a long naked stalk, the spike being composed of 6–10 dense clusters in the axis of small, brownish, rhomboidal, tapering, opposite bracts, the clusters being more widely separated towards the base of the spike. The calyx is tubular, contracted towards the mouth, marked with 13 ribs and 5-toothed, the posterior tooth being the largest. The corolla is of a pale violet colour, but darker on its inner surface, tubular, two-lipped, the upper lip with two and the lower with three lobes. Both corolla and calyx are covered with stellate hairs, amongst which are imbedded shining oil glands to which the fragrance of the plant is due. The leaves and flowers of lavender are said to have been used by the ancients to perfume their baths; hence the Med. Lat. name *Lavandula* or *Lavandane* is supposed to have been derived from *lavare*, to wash. This derivation is considered doubtful and a connexion has been suggested with Lat. *litere*, to be of a bluish, pale or livid colour.

Although L. Stoechas was well known to the ancients, no allusion unquestionably referring to *L. vera* has been found in the writings of classical authors, the earliest mention of the latter plant being in the 12th century by the abbes Hildegard, who lived near Bingen on the Rhine. Under the name of *Ilfani* or *Ilfandilly* it was known to the Welsh physicians as a medicine in the 12th century. The dried flowers have long been used in England, the United States and other countries for perfuming linens, and the characteristic cry of "Lavender! sweet lavender!" was still to be heard in London streets at the beginning of the 20th century. In England lavender is cultivated chiefly for the distillation of its essential oil, of which it yields on an average 1½% when freed from the stalks, but in the south of Europe the flowers form an object of trade, being exported to the Barbary states, Turkey and America.

In Great Britain lavender is grown in the parishes of Mitcham, Carshalton and Beddington in Surrey, and in Hertfordshire in the parish of Hitchin. The most suitable soil seems to be a sandy loam with a calcareous substratum, and the most favourable position a locality elevated above the level of fogs, where the plant is not in danger of early frost and is freely exposed to air and light. At Hitchin lavender is said to have been grown as early as 1560, but as a commercial speculation its cultivation dates back to 1823. The plants at present in cultivation do not produce seed, and the propagation is always made by slips or by dividing the roots. The latter plan has only been followed since 1860, when a large number of lavender plants were killed by a severe frost. Since that date the plants have been subject to the attack of a fungus, in consequence of which the price of the oil has been considerably enhanced.

The flowers are collected in the beginning of August, and taken down while still yielding. The yield of oil depends in great measure upon the weather. After a wet and dull June and July the yield is sometimes only half as much as when the weather has been bright and sunny. From 12 to 30 lb. of oil per acre is the average amount. The oil is a yellowish liquid with a high linalool content, and has a more rank odour and is less volatile than that of the flowers; consequently the portion that distills over after the first hour and a half is collected separately. The finest oil is obtained by the distillation of the flowers, without the stalks, but the labour spent upon this adds about 10s. per lb. to the expense of the oil, and the same is practically attained by fractional distillation. The oil mellows by keeping three years, after which it deteriorates unless mixed with alcohol; it may also be improved by redistillation. Oil of lavender is distilled from the wild plants in Piedmont and the South of France, especially in the village of Versace, near Mont Ventoux, and in those some leagues west of Montpellier. The best French oil realizes scarcely one-sixth of the price of the English oil. Cheaper varieties are made by distilling the entire plant.

Oil of lavender is a mobile liquid having a specific gravity from 0.85 to 0.89. Its chief constituents are linalool, which also occurs in oil of bergamot, and linalool, C10H16O, an alcohol derived by oxidation from myrcene, C10H18, which is one of the terpenes. The dose is 3–5 minims. The British pharmacopoeia contains a spiritus lavandae coagulatus of 5–20 minims; and a compound tincture, dose 4–1 drachm. This is contained in liquor arsenicalis, and its characteristic odour may thus be of great practical importance, medicinally and otherwise. The pharmacology of oil of lavender is simply that of an emotionally pleasant and mild volatile oil. It is largely used as a carminative and as a colouring and flavouring agent. Its adulteration with alcohol may be detected by chlored calcium dissolving in it and forming a separate layer of liquid at the bottom (the so-called Gley). Chloroform acts in the same way. If it contain turpentine it will not dissolve in three volumes of alcohol, in which quantity the pure oil is perfectly soluble.

Lavender flowers were formerly considered good for "all disorders of the head and nerves"; a spirit prepared with them was known under the name of pulse drops.

Lavender water consists of a solution of the volatile oil in spirit
of wine with the addition of the essences of musk, rose, bergamot and ambergris, but is very rarely prepared by distillation of the flowers with spirit.

In the state of New York lavender is scarcely hardy, but in the vicinity of Philadelphia considerable quantities are grown for the market. In American gardens sweet basil (Ocimum basilicum) is frequently called lavender.

Lavandula Stoechas, a species extending from the Canaries to Asia Minor, is distinguished from the above plants by its blackish purple flowers, and short stalked spikes crowned by conspicuous bracts as well as cymes. They have been cultivated in greenhouses, &c., in England.

Lavandula, a species named in England to several species of Statice, a genus of litoral plants belonging to the order Plumbaginales. Lavender cotton is a species of the genus Santolina, small, yellow-flowered, evergreen underbrushes of the Composite order.

LAVERDY—LAVERGERIE 293

of

LAVERDY, CLÉMENT CHARLES FRANÇOIS DE (1723-1793), French statesman, was a member of the parlement of Paris when the case against the Jesuits came before that body in August 1761. He demanded the suppression of the order and thus acquired popularity. Louis XV. named him controller-general of the finances in December 1763, but the burden was great and Laverdy knew nothing of finance. Three months after his nomination he forbade anything of any kind whatever to be printed concerning his administration, thus advising refusers. He used all sorts of expedients, sometimes dishonest, to replenish the treasury, and was even accused of having himself profited from the commerce in wheat. A court intrigue led to his sudden dismissal on the 1st of October 1768. Henceforward he lived in retirement until, during the Revolution, he was involved in the charges against the financiers of the old régime. The Revolutionary tribunal condemned him to death, and he was guillotined on the 24th of November 1793.

See A. Joubert, La France sous Louis XV (1869).

LAVERGERIE, CHARLES MARTIAL ALLEMAND (1825-1892), French divine, cardinal, archbishop of Carthage and primate of Africa, was born at Bayonne on the 31st of October 1825, and was educated at St Sulpice, Paris. He was ordained priest in 1849, and prelate in 1853. As bishop of Carthage he made a notable mission to his native country in 1861-2, and was created cardinal in 1870. After his elevation to the archbishopric of Lyons he retired to Algeria. Lavigerie died from a stroke of apoplexy on the 11th of May 1892, and was consecrated a cardinal in the following year.

LAVERGERIE, CHARLES MARTIAL ALLEMAND (1825-1892), French divine, cardinal, archbishop of Carthage and primate of Africa, was born at Bayonne on the 31st of October 1825, and was educated at St Sulpice, Paris. He was ordained priest in 1849, and prelate in 1853. As bishop of Carthage he made a notable mission to his native country in 1861-2, and was created cardinal in 1870. After his elevation to the archbishopric of Lyons he retired to Algeria. Lavigerie died from a stroke of apoplexy on the 11th of May 1892, and was consecrated a cardinal in the following year.
LA VILLEMARQUÉ—LAVISSE

and emphasized it by having the Marseillaise played by a band of his Pères Blancs. The further steps in this evolution emanated from the pope, and Lavergne, whose health now began to fail, receded comparatively into the background. He died at Algiers on the 26th of November 1672. (G. F. B.)

LA VILLEMARQUÉ, THÉODORE CLAUDE HENRI, Vicomte HERSART DE (1815-1895), French philologist and man of letters, was born at Keransker, near Quimperlé, on the 6th of July 1815. He was descended from an old Breton family, which counted among its members a Hersart who had followed Saint Louis to the Crusade, and another who was a companion in arms of Du Guesclin. La Villemarqué devoted himself to the elucidation of the monuments of Breton literature. Introduced in 1831 by Jacob Grimm as correspondent to the Academy of Berlin, he became in 1838 a member of the Academy of Inscriptions. His works include: Contes populaires des anciens Bretons (1842), to which was prefixed an essay on the origin of the romances of the Round Table; Éssai sur l'histoire de la langue bretonne (1837); Poèmes des bardes bretons du sixième siècle (1839); La Légende celtique in Ireland, en Cambrie et en Bretagne (1850). The popular Breton songs published by him in 1849 as Barzaz Breiz were considerably retouched. La Villemarqué's work has been superseded by the work of later scholars, but he has the merit of having done much to arouse popular interest in his subject. He died at Keransker on the 8th of December 1895.

On the subject of the doubtful authenticity of Barzaz Breiz, see Luulô's Preface to his Chansons populaires de la Basse-Bretagne, and, for a list of works on the subject, the Revue Celtique (vol. v.).

LAVINIUM, an ancient town of Latium, on the so-called Via Lavinatis (see Laurentina, Via), 19 m. S. of Rome, the modern Pratica, situated 300 ft. above sea-level and 27 m. N.E. from the sea-coast. Its foundation is attributed to Aeneas (whereas Laurentum was the primitive city of King Latinus), who named it after his wife Lavinia. It is rarely mentioned in Roman history and often confused with Lanuvium or Lavinium in the text both of authors and of inscriptions. The custom by which the consuls and praetors or dictators sacrificed on the Alban Mount and at Lavinium to the Penates and to Vesta, before they entered upon office or departed for their province, seems to have been one of great antiquity. There is no trace of its having continued into imperial times, but the cults of Lavinium were kept up, largely by the imperial appointment of honorary non-resident citizens to hold the priesthoods. The city seems to have been known under the empire as Laurentes Laviniiæ, and the place itself at a late period as Laureolavinium. It was deserted or forgotten not long after the time of Theodosius.

Lavinium was preceded by a more ancient town, Laurentum, the city of Latins (Verg. Aen. VIII.); of this the site is uncertain, but it is probably to be sought at the modern Tor Paterno, close to the sea-coast and 5 m. N. by W. of Lavinium. Here the name of Laurentum is preserved by the modern name Pantani di Lauro. Even in ancient times it was famous for its groves of bay-trees (laurus) from which its name was perhaps derived, and which in imperial times gave the villas of its territory a name for salubrity, so that both Vitellius and Commodus resorted there. The exact date of the abandonment of the town itself and the incorporation of its territory with that of Lavinium is uncertain, but it may be placed in the latter part of the republic. Under the empire a portion of it must have been imperial domain and forest. We hear of an imperial procurator in charge of the elephants at Laurentum; and the imperial villa may perhaps be identified with the extensive ruins at Tor Paterno itself.

The remains of numerous other villas lie along the ancient coast-line (which was half a mile inland of the modern, being now marked by a row of sand-hills, and was followed by the Via Severiana), both north-west and south-east of Tor Paterno: they extended as a fact in an almost unbroken line along the low sandy coast—now entirely deserted and largely occupied by the low scrub which serves as cover for the wild boars of the king of Italy's preserves—from the mouth of the Tiber to Antium, and thence again to Astura; but there are no traces of any buildings previous to the imperial period. In one of these, excavated by the king of Italy in 1906, was found a fine replica of the famous discobolis of Myron. The plan of the building is interesting, as it diverges entirely from the normal type and adapts itself to the site. Some way to the N.W. was situated the villa of Vicus Augustanus Laurentium, taking its name probably from Augustus himself, and probably identical with the village mentioned by Pliny the younger, which was separated by only one villa from his own. This village was brought to light by excavation in 1874, and its forum and curia are still visible. The remains of the villa of Pliny, too, were excavated in 1713 and in 1802-1819, and it is noteworthy that the place bears the name Villa di Pino (sic) on the staff map; how old the name is, is uncertain. It is impossible without further excavation to reconcile the remains—mainly of substructions—with the elaborate description of his villa given by Pliny (cf. H. Winnefeld in Jahrbuch des Institutes, 1891, 200 seq.).

The site of the ancient Lavinium, no less than 300 ft. above sea-level and 25 m. inland, is far healthier than the low-lying Laurentum, where, except in the immediate vicinity of the coast, malaria must have been a dreadful scourge. It possesses considerable natural strength, and consists of a small hill, the original acropolis, occupied by the modern castle and the village surrounding it, and a larger one, now given over to cultivation, with the name of Algiers. On the former there are now no traces of antiquity, but on the latter there are indications of the city walls, in small blocks of the grey-green tufa (cappellaccio) which is used in the earliest buildings of Rome, and traces of the streets. The necropolis, too, has been discovered, but not systematically excavated; but objects of the first Iron age, including a sword of Aeganean type (thus confirming the tradition), have been found; also remains of a building with Doric columns of an archaistic type, remains of later buildings in brick, and inscriptions, some of them of considerable interest.

See R. Lanciani in Monumenti dei Lincei, xiii. (1903), 133 seq.; xvi. (1906), 241 seq. (T. As.)

LAVISSE, ERNEST (1842— ), French historian, was born at Nouvion-en-Thiérache, Aisne, on the 17th of December 1842. In 1865 he obtained a fellowship in history, and in 1875 became a doctor of letters; he was appointed maître de conférence (1876) at the école normale supérieure, succeeding Fuset de Coulanges, and then professor of modern history at the Sorbonne (1888), in the place of Henri Wallon. He was an eloquent professor, and in the first of the two volumes of his Cours de l'histoire ancienne et moderne (1889), he unfolded the story of the Decline and Fall of the Roman Empire in an act of teaching which shows the bearing of the epoch in which he was living. He was a keen student of the history of the modern German empire and the grounds for its strength. With his friend Alfred Rambaud he conceived the plan of L'Histoire générale du IVe siècle jusqu'à nos jours, to which, however, he contributed nothing. He edited the Histoire de France depuis les origines jusqu'à la Révolution (1901—), in which he carefully revised the work of his numerous assistants, reserving the greatest part of the reign of Louis XIV. for himself. This
section occupies the whole of volume vii. It is a remarkable piece of work, and the sketch of absolute government in France during this period has never before been traced with an equal amount of insight and brilliance. Lavisse was admitted to the Académie Française on the death of Admiral Jurien de la Gravière in 1892, and after the death of James Darmesteter became editor of the Revue de Paris. He is, however, chiefly a master of pedagogy. When the école normale was joined to the university of Paris, Lavisse was appointed director of the new organization, which he had helped more than any one to bring about.

LAVOISIER, ANTOINE LAURENT (1743-1794). French chemist, was born in Paris on the 26th of August 1743. His father, an officer at Versailles, gave him an excellent education at the collège Mazarin, and encouraged his taste for natural science; and he studied mathematics and astronomy with N. L. de Lacaille, chemistry with the elder Rouelle and botany with Bernard de Jussieu. In 1766 he received a gold medal from the Academy of Sciences for an essay on the best means of lighting a large town; and among his early work were papers on the analysis of gypsum, on thunder, on the aurora and on congelation, and a refutation of the prevalent belief that water by repeated distillation is converted into earth. He also assisted J. E. Guettard (1715-1786) in preparing his mineralogical atlas of France. In 1768, recognized as a man who had both the ability and the means for a scientific career, he was nominated adjoint chimiste to the Academy, and in that capacity made numerous reports on the most diverse subjects, from the theory of colours to water-supply and from invalid chairs to mesmerism and the divine rod. The same year he obtained the position of adjoint to Baudon, one of the farmers-general of the revenue, subsequently becoming a full titular member of the body. This was the first of a series of posts in which his administrative abilities found full scope. Appointed régisseur des poudres in 1775, he not only abolished the vexatious search for saltpetre in the cellars of private houses, but increased the production of the salt and improved the manufacture of gunpowder. In 1785 he was nominated to the committee for agriculture, and as its secretary drew up reports and instructions on the cultivation of various crops, and promulgated schemes for the establishment of experimental agricultural stations, the distribution of agricultural implements and the adjustment of rights of pastureage. Seven years before he had started a model farm at Fréchines, where he demonstrated the advantages of scientific methods of cultivation and of the introduction of good breeds of cattle and sheep. Chosen a member of the provincial assembly of Orleans in 1787, he busied himself with plans for the improvement of the social and economic conditions of the community by means of savings banks, insurance societies, canals, workhouses, &c.; and he showed the sincerity of his philanthropical work by advancing money out of his own pocket, without interest, to the towns of Blois and Romorantin, for the purchase of barley during the famine of 1788. Attached in this same year to the caisse d'escompte, he presented the report of its operations to the national assembly in 1789, and as commissary of the treasury in 1791 he established a system of unexamined punctuality. He was also asked by the national assembly to draw up a new scheme of taxation in connexion with which he produced a report De la richesse territoriale de la France, and he was further associated with committees on hygiene, coinage, the casting of cannon, &c., and was secretary and treasurer of the commission appointed in 1790 to secure uniformity of weights and measures.

In 1791, when Lavoisier was in the middle of all this official activity, the suppression of the farmers-general marked the beginning of troubles which brought about his death. His membership of that body was alone sufficient to make him an object of suspicion; his administration at the régie des poudres was attacked; and Marat accused him in the Ami du Peuple of putting Paris in prison and of stopping the circulation of air in the city by the murr d'octobre erected at his suggestion in 1787. The Academy, of which as treasurer at the time he was a conspicuous member, was regarded by the convention with no friendly eyes as being tainted with "incivism," and in the spring of 1792 A. F. Fourcroy endeavoured to persuade it to purge itself of suspected members. The attempt was unsuccessful, but in August of the same year Lavoisier had to leave his house and laboratory at the Arsenal, and in November the Academy was forbidden until further orders to fill up the vacancies in its numbers. Next year, on the 1st of August, the convention passed a decree for the uniformity of weights and measures, and requested the Academy to take measures for carrying it out, but a week later Fourcroy persuaded the same convention to suppress the Academy together with other literary societies patentes et dotées by the nation. In November it ordered the arrest of the ex-farmers-general, and on the advice of the committee of public instruction, of which Guyton de Morveau and Fourcroy were members, the names of Lavoisier and others were struck off from the commission of weights and measures. The fate of the ex-farmers-general was sealed on the 2nd of May 1794, when, on the proposal of Antoine Dupin, one of their former officials, the convention sent them for trial by the Revolutionary tribunal. Within a week Lavoisier and 27 others were condemned to death. A petition in his favour addressed to Cofinalh, the president of the tribunal, is said to have been met with the reply La République n'a pas besoin de savants, and that the death of Lavoisier and the 27 others were guillotined at the Place de la Révolution. He died fourth, and was preceded by his colleague Jacques Paulze, whose daughter he had married in 1771. "Il ne leur a fallu," Lagrange remarked, "qu'un moment pour faire tomber cette tête, et cent années peut-être ne suffiront pas pour en reproduire une semblable."

Lavoisier's name is indissolubly associated with the overthrow of the phlogistic doctrine that had dominated the development of chemistry for over a century, and with the establishment of the foundations upon which the modern science reposes. "He discovered," says Justus von Liebig (Letters on Chemistry, No. 3), "no new body, no new property, no natural phenomenon previously unknown; but all the facts established by him were the necessary consequences of the labours of those who preceded him. His merit, his immortal glory, consists in this—that he infused into the body of the science a new spirit; but all the members of that body were already in existence, and rightly joined together." Realizing that the total weight of all the products of a chemical reaction must be exactly equal to the total weight of the reacting substances, he made the balance the ultima ratio of the laboratory, and he was able to draw correct inferences from his weighings because, unlike many of the phlogistonists, he looked upon heat as imponderable. It was by weighing that in 1770 he proved that water is not converted into earth by distillation, for he showed that the total weight of a sealed glass vessel and the water it contained remained constant, however long the water was boiled, but that the glass vessel lost weight to an extent equal to the weight of earth produced, his inference being that the earth came from the glass, not from the water. On the 1st of November 1772 he deposited with the Academy a sealed note which stated that sulphur and phosphorus when burnt increased in weight because they absorbed "air," while the metallic lead formed from litharge by reduction with charcoal weighed less than the original litharge because it had lost "air." The exact nature of the airs concerned in the processes he did not explain until after the preparation of "diphlogisticated air" (oxygen) by Priestley in 1774. Then perceiving that in combustion and the calculation of metals only a portion of a given volume of common air was used up, he concluded that Priestley's new air, air éminemment pur, was what he called "vital air," azote, or nitrogen remaining behind. The gas given off in the reduction of metallic calces by charcoal he at first supposed to be merely that contained in the calx, but he soon came to understand that it was a product formed by the union of the charcoal with the "diphlogisticated air" in the calx. In a memoir presented to the Academy in 1777, but not published till 1782,
he assigned to dephlogistigated air the name oxygen, or “acid-producer,” on the supposition that all acids were formed by its union with a simple, usually non-metallic, body; and having verified this notion for phosphorus, sulphur, charcoal, &c., and even extended it to the vegetable acids, he naturally asked himself what was formed by the combustion of “inflammable air” (hydrogen). This problem he had attacked in 1774, and in subsequent years he made various attempts to discover the acid which, under the influence of his oxygen theory, he expected would be formed. It was not till the 25th of June 1783 that in conjunction with Laplace he announced to the Academy that water was the product formed by the combination of hydrogen and oxygen, but by that time he had been anticipated by Cavendish, to whose prior work, however, as to that of several other investigators in other matters, it is to be regretted that he did not render due acknowledgment. But a knowledge of the composition of water enabled him to storm the last defences of the phlogistonists. Hydrogen they held to be the phlogiston of metals, and they supported this view by pointing out that it was liberated when metals were dissolved in acids. Considerations of weight had long prevented him from accepting this doctrine, but he was now able to explain the process fully, showing that the hydrogen evolved did not come from the metal itself, but was one product of the decomposition of the water of the dilute acid, the other product, oxygen, combining with the metal to form an oxide which in turn united with the acid. A little later this same knowledge led him to the beginnings of quantitative organic analysis. Knowing that the water produced by the combustion of alcohol was not pre-existent in that substance but was formed by the combination of its hydrogen with the oxygen of the air, he burnt alcohol and other combustible organic substances, such as wax and oil, in a known volume of oxygen, and, from the weight of the water and carbon dioxide produced and his knowledge of their composition, was able to calculate the amounts of carbon, hydrogen and oxygen present in the substance.

Up to about this time Lavoisier’s work, mainly quantitative in character, had appealed most strongly to physicians, but it now began to win conviction from chemists also. C. L. Berthollet, L. B. Guyton de Morveau and A. F. Fourcroy, his collaborators in the reformed system of chemical terminology set forth in 1787 in the *Méthode de nomenclature chimique*, were among the earliest French converts, and they were followed by M. H. Klaproth and the German Academy, and by most English chemists except Cavendish, who rather suspended his judgment, and Priestley, who stubbornly clung to the opposite view. Indeed, though the partisans of phlogiston did not surrender without a struggle, the history of science scarcely presents a second instance of a change so fundamentally accomplished with such ease. The spread of Lavoisier’s doctrines was greatly facilitated by the defined and logical form in which he presented them in his *Traité élémentaire de chimie* (présenté dans un ordre nouveau et d’après les découvertes modernes) (1789). The list of simple substances contained in the first volume of this work includes light and caloric with oxygen, azote and hydrique; in the list of “imvariable, indivisible” substances, the combination of which with oxygen yielded acids, were placed sulphur, phosphorus, carbon, and the muriatic, fluoric and boracic radicles. The metals, which by combination with oxygen became oxides, were antimony, silver, arsenic, bismuth, cobalt, copper, tin, iron, manganese, mercury, molybdenum, nickel, gold, platinum, lead, tungsten and zinc; and the “simple earthly salifiable substances” were lime, baryta, magnesia, alumina and silica.

The simple nature of the alkalies Lavoisier considered so doubtful that he did not class them as elements, which he conceived as substances which could not be further decomposed by any known process of analysis—les molécules simples et indivisibles qui composent les corps. The union of any two of the elements gave rise to binary compounds, such as oxides, acids, sulphides, &c. A substance containing three elements was a binary compound of the second order; thus salts, the most important compounds of this class, were formed by the union of acids and oxides, iron sulphate, for instance, being a compound of iron oxide with sulphuric acid.

In addition to his purely chemical work, Lavoisier, mostly in conjunction with Laplace, devoted considerable attention to physical problems, especially those connected with heat. The two carried out some of the earliest thermochemical investigations, devised apparatus for measuring linear and cubical expansions, and employed a modification of Joseph Black’s ice calorimeter in a series of determinations of specific heats. Regarding heat (matière de feu or fluide igné) as a peculiar kind of imponderable matter, Lavoisier held that the three states of aggregation—solid, liquid and gas—were modes of matter, each depending on the amount of matière de feu with which the ponderable substances concerned were interpenetrated and combined; and this view enabled him correctly to anticipate that gases would be reduced to liquids and solids by the influence of cold and pressure. He also worked at fermentation, respiration and animal heat, looking upon the processes concerned as essentially chemical in nature. A paper discovered many years after his death showed that he had anticipated later thinkers in explaining the cyclical process of animal and vegetable life, for he pointed out that plants derive their food from the air, from water, and in general from the mineral kingdom, and animals in turn feed on plants or on other animals fed by plants, while the materials thus taken up by plants and animals are restored to the mineral kingdom by the breaking-down processes of fermentation, putrefaction and combustion.

A complete edition of the writings of Lavoisier, *Œuvres de Lavoisier, publiées par les soins du ministre de l’instruction publique*, was issued at Paris in six volumes from 1854-1893. This publication contains his *Opuscules physiques et chimiques* (1774), many memoirs from the Academy volumes, and numerous letters, notes and reports relating to the various matters on which he was engaged. At the time of his death Lavoisier was preparing for publication his collected works, and the portions ready for the press were published in two volumes as *Mémoires de chimie* in 1805 by his widow (in that year married to Count Rumford), who had drawn and engraved the plates in his *Traité élémentaire de chimie* (1789).

See E. Girmaux, *Lavoisier 1743-1794, d’après sa correspondance, ses manuscrits, &c.* (1888), which gives a list of his works; P. E. M. Berthelot, *La Révolution chimique*: Lavoisier (1890), which contains an assembly of and extracts from his laboratory notebooks.

**LA VOISIN. CATHERINE MONVOISIN**, known as “La Voisin” (d. 1680), French sorceress, whose maiden name was Catherine Deshayes, was one of the chief personages in the famous affaire des poisons, which disgraced the reign of Louis XIV. Her husband, Monvoisin, was an unsuccessful jeweller, and she practised chiroiomy and face-reading to retrieve their fortunes. She gradually added the practice of witchcraft, in which she had the help of a renegade priest, Étienne Guiourg, whose part was the celebration of the “black mass,” an abominable parody in which the host was compounded of the blood of a little child mixed with horrible ingredients. She practised medicine, especially midwifery, procured abortion and provided love powders and poisons. Her chief accomplice was one of her lovers, the magician Lesage, whose real name was Adam Courret. The great ladies of Paris flocked to La Voisin, who accumulated a fortune of 50,000 livres. She had two sons, Pierre Monvoisin and Jean, and a daughter, Louise de la Vallière; Mme de Montespan, Mme de Gramont (la belle Hamilton) and others. The bones of toads, the teeth of moles, cantharides, iron filings, human blood and human dust were among the ingredients of the love powders concocted by La Voisin. Her knowledge of poisons was not apparently so thorough as that of less well-known sorcerers, or it would be difficult to account for La Vallière’s immunity. The art of poisoning had become a regular science. The death of Henrietta, duchess of Orleans, was attributed, falsely it is true, to poison, and the crimes of Marie Madeleine de Brinvilliers (executed in 1676) and her accomplices were still fresh in the public mind. In April 1679 a commission appointed to inquire into the subject and to prosecute the offenders met for the first time. Its proceedings, including some suppressed in the official records, are preserved in the notes of one of the official rapporteurs, Gabriel Nicolas de la Reynie. The revelation of the treacherous intention...
of Mme de Montespan to poison Louis XIV. and of other crimes, planned by personages who could not be attacked without scandal which touched the throne, caused Louis XIV. to close the chambre ardente, as the court was called, on the 1st of October 1680. It was reopened on the 10th of May 1681 and sat until the 21st of July 1682. Many of the culprits escaped through private influence. Among these were Marie Anne Manchini, duchesse de Bouillon, who had sought to get rid of her husband in order to marry the duke of Vendôme, though Louis XIV. banished her to Nérac. Mme de Montespan was not openly disgraced, because the preservation of Louis’s own dignity was essential, and some hundred prisoners, among them the infamous Guibourg and Lesage, escaped the scaffold through the suppression of evidence insisted on by Louis XIV. and Louvois. Some of these were imprisoned in various fortresses, with instructions from Louvois to the governors to flog them if they sought to impart what they knew. Some innocent persons were imprisoned for life because they had knowledge of the facts. La Voisin herself was executed at an early stage of the proceedings, on the 20th of February 1680, after a perfunctory application of torture. The authorities had every reason to avoid further revelations. Thirty-five other prisoners were executed; five were sent to the galleys and twenty-three were banished. Their crimes had furnished one of the most extraordinary trials known to history.

See F. Ravaisson, Archives de la Bastille, vols. iv., vii. (1870–1874); the register preserved in the Bibliothèque Nationale; F. F. Finck-Brentano, Le Drame des poisons (1899); A. Masson, La Sorcellerie et la science des poisons au xviiie siècle (1904). Sardou made the affair a background for his Affaire des poisons (1907). There is a portrait of La Voisin by Antoine Coupel, which has been often reproduced.

**LAW, JOHN** (1671–1729), Scots economist, best known as the originator of the “Mississippi scheme,” was born at Edinburgh in April 1671. His father, a goldsmith and banker, bought shortly before his death, which took place in his son’s youth, the lands of Lauriston near Edinburgh. John lived at home till he was twenty, and then went to London. He had already studied mathematics, and the theory of commerce and political economy, with much interest; but he was known rather as shop scholar. In London he gambled, drank and flirted till in April 1694 a love intrigue resulted in a duel with Beau Wilson in Bloomsbury Square. Law killed his antagonist, and was condemned to death. His life was spared, but he was detained in prison. He found means to escape to Holland, then the greatest commercial country in Europe. Here he observed with close attention the practical working of banking and financial business, and conceived the first ideas of his celebrated “system.” After a few years spent in foreign travel, he returned to Scotland, then exhausted and enraged by the failure of the Darien expedition (1695–1701). He propounded plans for the relief of his country in a work entitled *Money and Trade Considered, with a Proposal for supplying the Nation with Money* (1705). This attracted some notice, but had no practical effect, and Law had nothing to do with it. He visited Brussels, Paris, Vienna, Genoa, Rome, making large sums by gambling and speculation, and spending them lavishly. He was in Paris in 1708, and made some proposals to the government as to their financial difficulties, but Louis XIV. declined to treat with a “Huguenot,” and d’Argenson, chief of the police, had Law expelled as a suspicious character. He had, however, become intimately acquainted with the duke of Orleans, and when in 1715 that prince became regent, Law at once returned to Paris.

The extravagant expenditure of the late monarch had plunged the kingdom into apparently inextricable financial confusion. The debt was 3,000 million livres, the estimated annual expenditure, exclusive of interest payments, 145 million livres, and the income about the same. The advisability of declaring a national bankruptcy was seriously discussed, and though this plan was rejected, measures hardly less violent were carried. By a *visà-vis*, or examination of the state liabilities by a committee with full powers of quashing claims, the debt was reduced nearly a half, the coin in circulation was ordered to be called in and reassured at the rate of 120 for 100—a *measure* by which foreign coiner profited greatly, and a chamber of justice was established to punish speculators, to whom the difficulties of the state were ascribed. These measures had so little success that the *billets d’état* which were issued as part security for the new debt at once sank 75% below their nominal value. At this crisis Law unfolded a vast scheme to the perplexed regent. A royal bank was to manage the trade and currency of the kingdom, to collect the taxes, and to free the country from debt. The council of finance, then under the duc de Noailles, opposed the plan, but the regent allowed Law to take some tentative steps. By an edict of 2nd May 1716, a private institution called *La Banque générale*, and managed by Law, was founded. The capital was 6 million livres, divided into 1200 shares of 5000 livres, payable in four instalments, one-fourth in cash, three-fourths in *billets d’état*. It was to perform the ordinary functions of a bank, and had power to issue notes payable at sight in the weight and value of the money mentioned at day of issue. The bank was a great and immediate success. By providing for the absorption of part of the state paper it raised the credit of the government. The notes were a more desirable medium of exchange, for they had the element of finity of value, which, owing to the arbitrary mint decrees of the government, was wanting in the coin of the realm. They proved the most convenient instruments of remittance between the capital and the provinces, and they thus developed the industries of the latter. The rate of interest, previously enormous and uncertain, fell first to 6 and then to 4%; and when another decree (10th April 1717) ordered collectors of taxes to receive notes as payments, and to change them for coin at request, the bank so rose in favour that it soon had a note-issue of 60 million livres. Law now gained the full confidence of the regent, and was allowed to proceed with the development of the scheme.

The trade of the region about the Mississippi had been granted to a speculator named Crozat. He found the undertaking too large, and was glad to give it up. By a decree of August 1717 Law was allowed to establish the *Compagnie de la Louisiane ou d’Occident*, and to endow it with privileges practically amounting to sovereignty over the most fertile region of North America. The capital was 100 million livres divided into 200,000 shares of 500 livres. The payments were to be one-fourth in coin and three-fourths in *billets d’état*. On these last the government was to pay 3 million livres interest yearly to the company. As the state paper was depreciated the shares fell much below par. The rapid rise of Law had made him many enemies, and they took advantage of this to attack the system. D’Argenson, now head of the council of finance, with the brothers Paris de Grenoble, famous tax farmers of the day, formed what was called the “anti-system.” The farming of the taxes was let to them, under an assumed name, for 4½ million livres yearly. A company was formed, the exact counterpart of the Mississippi company. The capital was the same, divided in the same manner, but the payments were to be entirely in money. The returns from the public revenue were sure; those from the Mississippi scheme were not. Hence the shares of the latter were for some time out of favour. Law proceeded unmoved with the development of his plans. On the 4th of December 1718 the bank became a government institution under the name of *La Banque royale*. Law was director, and the king guaranteed the notes. The shareholders were repaid in coin, and, to widen the influence...
of the new institution, the transport of money between towns
where it had branches was forbidden. The paper-issue now
reached 110 millions. Law had such confidence in the success
of his plans that he agreed to take over shares in the Mississippi
company at par at a near date. The shares began rapidly to rise.

The next move was to unite the companies Des Indes Orientales
and De Chine, founded in 1664 and 1713 respectively, but now
dwindled away to a shadow, to his company. The united associa-
tion, La Compagnie des Indes, had a practical monopoly of the
foreign trade of France. These proceedings necessitated the
creation of new capital to the nominal amount of 25 million livres.
The payment was spread over 20 months. Every holder of four
original shares (mères) could purchase one of the new shares
(filles) at a premium of 50 livres. All these 500-livre shares
rapidly rose to 520, or 50% above par. Law now turned his
attention to obtaining additional powers within France itself.
On the 25th of July 1719 an edict was issued granting the
company for nine years the management of the mint and the
coin-issue. For this privilege the company paid 5 million livres,
and the money was raised by a new issue of shares of the nominal
value of 500 livres, but with a premium of other 500. The list
was opened for twenty days, and it was necessary to present
four mères and one fille in order to obtain one of the new shares
(petites filles). At the same time two dividends per annum of
6% each were promised. Again there was an attempt to ruin
the bank by the commonplace expedient of making a run on
it for coin; but the conspirators had to meet absolute power
managed with fearlessness and skill. An edict appeared reducing,
at a given date, the value of money, and those who had with-
drawn coin from the bank hastened again to exchange it for
the more stable notes. Public confidence in Law was increased,
and he was enabled rapidly to proceed with the completion of
the system. A decree of 27th August 1719 deprived the rival
company of the farming of the revenue, and gave it to the
Compagnie des Indes for nine years in return for an annual
payment of 52 million livres. Thus at one blow the "anti-
system" was crushed. One thing yet remained; Law proposed
to take over the national debt, and manage it on terms advan-
tageous to the state. The mode of transfer was this. The debt
was over 1500 million livres. Notes were to be issued to that
amount, and with these the state creditors must be paid in
certain order. Shares were to be issued at intervals corresponding
to the payments, and it was expected that the notes would be
used in buying them. The government was to pay 3% for the
loan. It had formerly been bound to pay 80 millions, it would
now pay under 50, a clear gain of over 30. As the shares of
the company were almost the only medium for investment,
the transfer would be surely effected. The creditors would
now look to the government payments and the commercial
gains of the company for their annual returns. Indeed the
creditors were often not able to procure the shares, for each
succeeding issue was immediately seized upon, though the 500-
livre share was now issued at a premium of 4500 livres. After
the third issue, on the 2nd of October, the shares immediately
resold at 8000 livres in the Rue Quinampoix, then used as a
bourse. They went on rapidly rising as new privileges were
still granted to the company. Law had now more than regal
power. The exiled Stuarts paid him court; the parlement
and monarchy in Europe humbled themselves before him, and his
liberality made him the idol of the populace. After, as a neces-
sary preliminary, becoming a Catholic, he was made controller-
general of the finances in place of d'Argenson. Finally, in
February 1720, the bank was in name as well as in reality united
to the company.

The system was now complete; but it had already begun to
decay. In December 1719 it was at its height. The shares
had then amounted to 20,000 livres, forty times their nominal
price. A sort of madness possessed the nation. Men sold their
all and hastened to Paris to speculate. The population of the
capital was increased by an enormous influx of provincials and
foreigners. Trade received a vast though unnatural impul-
se. Everybody seemed to be getting richer, no one poorer. Those
who could still reflect saw that this prosperity was not real.

The whole issue of shares at the extreme market-price valued
12,000 million livres. It would require 500 million annual
revenue to give a 5% dividend on this. Now, the whole income
of the company as yet was hardly sufficient to pay 5% on the
original capital of 1677 million livres. The receipts from the
taxes, &c., could be precisely calculated, and it would be many
years before the commercial undertakings of the company—
with which only some trifling beginning had been made—
would yield any considerable return. People began to sell their
shares, and to buy coin, houses, land—anything that had a stable
element of value in it. There was a rapid fall in the shares,
a rapid rise in all kinds of property, and consequently a rapid
depreciation of the paper money. Law met these new tendencies
by a succession of the most violent edicts. The notes were to
bear a premium over specie. Coin was only to be used in small
payments, and only a small amount was to be kept in the posses-

sion of private parties. The use of diamonds, the fabrication of
gold and silver plate, was forbidden. A dividend of 40% on
the original capital was promised. By several ingenious but falla-
ciously reasoned pamphlets Law endeavoured to restore public
confidence, and the exchanges renewed. The lavish spending
of the 1720, an edict appeared fixing their price at 9000 livres,
and ordering the bank to buy and sell them at that price. The
fall now was transferred to the notes, of which there were soon
over 2500 million livres in circulation. A large proportion of the
coined money was removed from the kingdom. Prices rose
enormously. There was everywhere distress and complete financial
confusion. Law became an object of popular hatred. He lost his court
influence, and was obliged to consent to a decree (21st May 1720)
by which the notes and consequently the shares were reduced
to their nominal value. This created such a commotion that
its promoters were forced to recall it, but the mischief was done.

What confidence could there be in the depreciated paper after
such a measure? Law was removed from his office, and his
enemies proceeded to demolish the "system." A vast number
of shares had been deposited in the bank. These were destroyed.

The notes were reconverted into government debt, but there
was now a deficit which reduced that debt to the same size as before
it was taken over by the company. The rate of interest was
lowered, and the government removed the royal privilege of
paying 5% instead of 80 millions annually. Finally the bank
was abolished, and the company reduced to a mere-trading associa-
tion. By November the "system" had disappeared. With
these last measures Law, it may well be believed, had nothing
to do. He left France secretly in December 1720, resumed his
wandering life, and died at Venice, poor and forgotten, on
the 21st of March 1729.

Of Law's writings the most important for the comprehension
of the "system" is his Money and Trade Considered. In this work
he only its political effects are laid weight, but it might have been
given to the eminent industries of the time, such as the news-
magazines of home and foreign goods. These depend on trade,
and on money, of which a greater quantity employs more
people; but credit, if the credit have a circulation, has all the
same effects as money. The clearest idea of credit is the function of a
bank. Let such be created then, and let its notes be only given in return for land sold or pledged. Such a
such currency would supply the nation with abundance of money; and give the key of trade and order to the
state, and the exchange of goods on an ample scale. The bank or commission was to be a government institu-
tion, and its profits were to be spent in encouraging the export
and manufacture of the nation. A very evident error lies at the root of this. The system, he thought. To increase it then must be beneficial, and the best way is
by a properly secured paper currency. This is the motive force; but it is to be applied in a particular way. Law had a profound belief in the omnipotence of government. He saw that the
monopolies, and of private farming of taxes. He proposed to centre foreign trade and internal finance in one huge monopoly managed by the state for the people, and carrying on business through a
series of exchanges of which commerce is left to private enterprise, and that such a scheme
would simply result in the profits of speculators and favourites. The "system" was never so far developed as to exhibit its in-
herent faults. The madness of speculators ruined the plan when only its political effects were laid weight, but it might have been
saved. The bank was not necessarily bound to the company, and
had its note-issue been retracted it might have become a permanent
institution. As Thiers points out, the edict of the 5th of March 1730, which made the shares convertible into notes, ruined the bank without saving the company. The shares had risen to an unnatural height, and they should have been allowed to fall to their natural level. It was his task to speed this process for his own private benefit, and he had found a court whose interests were involved in the shares, and he had enemies eager for his overthrow. It was necessary to succeed completely or not at all; so Law, a gambler to the core, risked and lost everything.

Notwithstanding the suddenness of the overthrow, the first edition of the volumes on the government and of the abdication of Louis 

There is a portrait of Law by A. S. Belle in the National Portrait Gallery, London.

**LAW, WILLIAM** (1686–1761), English divine, was born at King's Childe, Northamptonshire. In 1705 he entered as a sizar at Emmanuel College, Cambridge; in 1711 he was elected fellow of his college and was ordained. He resided at Cambridge, teaching and taking occasional duty until the accession of George I., when his conscience forbade him to take the oaths of allegiance to the new government and of abjuration of the Stuarts. His Jacobitism had already brought him into trouble; and he was then deprived of his fellowship and became a non-juror. For the next few years he is said to have been a curate in London. By 1727 he was domiciled with Edward Gibbon (1666–1756) at Putney as tutor to his son Edward, father of the historian, who says that Law became "the much honoured friend and spiritual director of the whole family." In the same year he accompanied his pupil to Cambridge, and resided with him as governor, in term time, for the next four years. His pupil then went abroad, but Law was left at Putney, where he remained in Gibbon's house for more than ten years, acting as a religious guide not only to the family but to a number of earnest-minded folk who came to consult him. The most eminent of these were the poet, George Cheyne, the physician, John Hales, and the Archdeacon of M.P. for Hastings. The household was dispersed in 1737. Law was parted from his friends, and in 1740 retired to King's Childe, where he had inherited from his father a house and a small property. There he was presently joined by two ladies: Mrs Hutcheson, the rich widow of his old friend, who recommended her on his death-bed to place herself under Law's spiritual guidance, and Miss Hester Gibbon, sister to his late pupil. This curious trio lived for twenty-one years a life wholly given to devotion, study and charity, until the death of Law on the 9th of April 1761.

Law was a busy writer under three heads:

1. *Controversy*. In this field he had no contemporary peer save perhaps Richard Bentley. The first of his controversial works was *Three Letters to the Bishop of Bangor* (1717), which were considered by friend and foe alike as one of the most powerful contributions to the Bangorian controversy on the high church side. Thomas Sherlock declared that "Mr Law was a writer so considerable that he knew but one good reason why his lordship did not answer him." Law's next controversial work was *Remarks on Mandeville's Fable of the Bees* (1723). In it he endeavoured to establish the theory that human actions, in the aggregate, always tend to public happiness; an idea which, though it has never been established with mathematical certainty, has been so far confirmed as to involve a great extent an anticipation of Bishop Butler's famous argument in the *Analogy*. In this work Law shows himself at least the equal of the ablest champion of Deism. *His Letters to a Lady inclined to enter the Church* (1724) is a series of admirable letters addressed to a high Anglican towards Romanism. His controversial writings have not received due recognition, partly because they were opposed to the drift of his times, partly because of his success in other fields.

2. *Political Divinity*. *The Serious Call to a Devout and Holy Life* (1728), together with its predecessor, *A Treatise of Christian Perfection* (1726), deeply influenced the chief actors in the great Evangelical revival. The Wesleys, George Whitefield, Henry Venn, Thomas Scott and Thornwell all express their deep obligation to the author. *The Serious Call* affected others quite as deeply. Samuel Johnson, Gibbon, Lord Lyttelton and Bishop Horne all spoke enthusiastically of its merits; and it is still the only work by which its author is popularly known. It has high merits of style, being lucid and pointed to a degree. In a tract entitled *The Absolute Unlawfulness of State Entertainments* (1726) Law was tempted by the corruptions of the stage of the period to use unreasoned language, and incurred some effective criticism from John Dennis in *The Stage Defended*.

3. *Mysticism*. Though the least popular, by far the most interesting, original and suggestive of all Law's works are those which he wrote on the subject of the *mysticism*. His meditations were published in a work entitled *Complete System of Mysticism* (1881). The *Short Case* of John Boyle, the Teutonic theosopher. From his earliest years he had been deeply impressed with the piety, beauty and thoughtfulness of the writings of the Christian mystics, but he was able to find no critical work which reported the system of John Boyle, about 1734, that pronounced mysticism appeared in his works. Law's mystic tendencies divorced him from the practical-minded Wesley, but in spite of occasional wild fancies the books are most important for the study of the mysticism. The *Mystical Path* and *Mystical Experience*. *Mystical Experience* and *Path of Divine Love* (1747), translated by G. B. Lewis, the late Dr J. H. Fairbairn. Law has been called "the last in a long line of Law's life in 1813. See also Christopher Walton, *Notes and Materials for a Complete Biography of W. Law* (1848); Sir Leslie Stephen, *English Thought in the 18th Century*, and in the *Dict. Nat. Bio. xxi. 296; W. H. Leckey, *History of English Church in the 18th Century*; and J. H. Overton, *William Law, Non-juror and Mystic* (1881).

**LAW**. O. Eng. lau, M. Eng. lau; from an old Teutonic root *lau*; "lie," what lies fixed or even; cf. Lat. lex, Fr. loi), a word used in English in two main senses—(1) as a rule prescribed by authority for human action, and (2) in scientific and philosophical phraseology, as a uniform order of sequence (e.g. "laws" of motion). In the first sense the word is used either in the abstract, for jurisprudence generally or for a state of things in which the laws of a country are duly observed ("law and order"), or in the concrete for some particular rule or body of rules. It is usual to distinguish further between "law" and "equity" (q.v.).

The scientific and philosophical usage has grown out of an early conception of jurisprudence, and is really metaphorical, derived from the phrase "natural laws," "law of nature," which presumed that human conduct was laid down by God (see T. E. Holland, *Elements of Jurisprudence*, ch. ii.). The adjective "legal" is only used in the abstract, never in the second. In the case of the "moral law" (see ETHICS) the term is employed somewhat ambiguously because of its connexion with both meanings. There is also an Old English use of the word "law" in a more or less sporting sense ("to give law" or "to allow so much law"), meaning a start or fair allowance in time or distance. Presumably this originated simply in the liberty-loving Briton's respect for proper legal procedure: instead of the brute exercise of tyrannous force he demanded "law," or a fair opportunity
and trial. But it may simply be an extension of the meaning of "right," or of the sense of "leave" which is found in early uses of the French loi.

In this work the laws or uniformities of the physical universe are dealt with in the articles on the various sciences. The general principles of law in the legal sense are discussed under Jurisprudence. What may be described as "national systems" of law are dealt with historically and generally under English Law, American Law, Roman Law, Greek Law, Mahommedan Law, Indian Law, &c. Certain broad divisions of law are treated under Constitution and Constitutional Law, Canon Law, Civil Law, Common Law, Criminal Law, Ecclesiastical Law, Equity, International Law, Military Law, &c. And the particular laws of different countries on special subjects are stated under the headings for those subjects (Bankruptcy, &c.). For courts (q.v.) of law, and procedure, see Jurisprudence, Appeal, Trial, King's Bench, &c.

Authorities.—The various legal articles have bibliographies attached, but it may be convenient here to mention such general works on law, apart from the science of jurisprudence, as (for English Law) Lord Halsbury's Laws of England (1860), The Encyclopædia of the Laws of England, ed. Wood Renton (1890), Stephen's Commentaries on the Laws of England (1903), Brett's Commentaries on the present Laws of England (1896), Broom's Commentaries on the Common Law (1896) and Brodie-Innes's Comparative Principles of the Laws of England and Scotland (vol. i., 1903); and, for American, Bouvier's Dictionary, and Kent's Commentaries on American Law.

LAWES, HENRY (1595-1662), English musician, was born at Dinton in Wiltshire in December 1595, and received his musical education from John Cooper, better known under his Italian pseudonym Giovanni Copertaro (d. 1627), a famous composer of the day. In 1626 he was received as one of the gentlemen of the chapel royal, which place he held till the Commonwealth put a stop to church music. But even during that songless time Lawes continued his work as a composer, and the famous collection of his vocal pieces, Ayres and Dialogues for One, Two, and Three Voices, was published in 1653, being followed by two other books under the same title in 1655 and 1658 respectively. When in 1660 the king returned, Lawes once more entered the royal chapel, and composed an anthem for the coronation of Charles II. He died on the 21st of October 1662, and was buried in Westminster Abbey. Lawes's name has become known beyond musical circles by his friendship with Milton, whose Comus he supplied with incidental music for the performance of the masque in 1634. The poet in return immortalized his friend in the famous sonnet in which Milton, with a musical perception not common amongst poets, exactly indicates the great merit of Lawes. His careful attention to the words of the poet, the manner in which his music seems to grow from those words, the perfect coincidence of the musical with the metrical accent, all put Lawes's songs on a level with those of Schumann or Liszt or any modern composer. At the same time he is by no means wanting in genuine melodic invention, and his concerted music shows the learned contrapuntist.

LAWES, SIR JOHN BENNET, BART. (1814-1900), English agriculturist, was born at Rothamsted on the 28th of December 1814. Even before leaving Oxford, where he matriculated in 1832, he had begun to interest himself in growing various medicinal plants on the Rothamsted estates, which he inherited on his father's death in 1822. About 1837 he began to experiment on the effects of various manures on plants growing in pots, and a year or two later the experiments were extended to crops in the field. One immediate consequence was that in 1842 he patented a manure formed by treating phosphates with sulphuric acid, and thus initiated the artificial manure industry. In the succeeding year he enlisted the services of Sir J. H. Gilbert, with whom he carried on for more than half a century those experiments in raising crops and feeding animals which have been described as the most important work of horticultural agriculturists all over the world (see Agriculture). In 1834 he was elected a Fellow of the Royal Society, which in 1867 bestowed a Royal medal on Lawes and Gilbert jointly, and in 1882 he was created a baronet. In the year before his death, which happened on the 31st of August 1900, he took measures to ensure the continued existence of the Rothamsted experimental farm by setting aside £500,000 for that purpose and constituting the Lawes Agricultural Trust, composed of four members from the Royal Society, two from the Royal Agricultural Society, one each from the Chemical and Linnaean Societies, and the owner of Rothamsted mansion-house for the time being.

LAW MERCHANT or Lex mercatoria, originally a body of rules and principles relating to merchants and mercantile transactions, laid down by merchants themselves for the purpose of regulating their dealings. It was composed of such usages and customs as were common to merchants and traders in all parts of Europe, varied slightly in different localities by special peculiarities. The law merchant owed its origin to the fact that the civil law was not sufficiently responsive to the growing demands of commerce, as well as to the fact that trade in pre-medieval times was practically in the hands of those who might be termed cosmopolitan merchants, who wanted a prompt and effective jurisdiction. It was administered for the most part in special courts, such as those of the guilds in Italy, or the fair courts of Germany and France, or as in England, in courts of the staple or piepowder (see also Sea Laws). The history of the law merchant in England is divided into three stages: the first prior to the time of Coke, when it was a special kind of law— as distinct from the common law—administered in special courts for a special class of the community (i.e. the mercantile); the second stage was one of transition, the law merchant being administered in the common law courts, but as a body of customs, to be proved as a fact in each individual case of doubt; the third stage, which has continued to the present day, dates from the presidency over the king's bench of Lord Mansfield (q.v.), under whom it was moulded into the mercantile law of to-day. To the law merchant modern English law owes the fundamental principles of the sale of goods and the law of partnership, negotiable instruments and trade marks.

LAWN, a very thin fabric made from level linen or cotton yarns. It is used for light dresses and trimmings, also for handkerchiefs. The terms lawn and cambric (q.v.) are often intended to indicate the same fabric. The word "lawn" was formerly derived from the French name for the fabric lanier, from lin, flax, linen, but Skeat (Etym. Dict., 1885, Addenda) and A. Thomas (Romænic, xxix. 182, 1900) have shown that the real source of the word is to be found in the name of the French town Laon. Skeat quotes from Palgrave, Les clairissements de la langue Françofse (1530), showing that the early name of the fabric was Laune lymen. An early form of the word was "laund," probably due to an adaptation to "laund," lawn, glade or clearing in a forest, now used of a closely-mown expanse of grass in a garden, park, &c. (see Grass and Horticulture). This word comes from O. Fr. launche, mod. laine, wild, or sandy ground, covered with scrub or bushwood, a word of Celtic origin; cf. Irish and Breton lann, heathy ground, also enclosure, land; Welsh llan, enclosure. It is cognate with "land," common to Teutonic languages. In the original sense of clearing in a forest, glade, Lat. saltus, "lawn," still survives in the New Forest, where it is used of the feeding-places of cattle.

LAWN-TENNIS, a game played with racquet and ball on a court traversed by a net, but without enclosing walls. It is a modern adaptation of the ancient game of tennis (q.v.), with which it is identical as regards the scoring of the game and the "set." Lawn-tennis is essentially a summer game, played in the open air, either on courts marked with whitewash on cleared-out grass like a cricket pitch, or on asphalt, gravel, wood, earth or other substance which can be so prepared as to afford a firm, level and smooth surface. In winter, however, the game is often played on the floor of gymnasia, drill sheds or other buildings, when it is called "covered-court lawn-tennis";
but there is no difference in the game itself corresponding to these varieties of court.

The lawn-tennis court for the single-handed game, one player against one ("singles"), is shown in fig. I, and that for the four-handed game ("doubles") in fig. 2. The net stretched across the middle of the court is attached to the tops of two posts which stand 3 ft. outside the court on each side. The height of the net is 3 ft. 6 in. at the posts and 3 ft. at the centre.

The court is bisected longitudinally by the half-court-line, which, however, is marked only between the two service-lines and at the points of junction with the base-lines. The divisions of the court on each side of the half-court-line are called respectively the right-hand and left-hand courts; and the portion of these divisions between the service-lines and the net are the right-hand service-court and left-hand service-court respectively. The balls, which are made of hollow india-rubber, tightly covered with white flannel, are 2½ in. in diameter, and from 1½ to 2 oz. in weight. The racquets (fig. 3), for which there are no regulation dimensions, are broader and lighter than those used in tennis.

Before play begins, a racquet is spun as in tennis, and the winner of the spin elects either to take first service or to take choice of court. If he takes choice of court, he and his partner (if the game be doubles) take their position on the selected side of the net, one stationing himself in the right-hand court and the other in the left, which positions are retained throughout the set. If the winner of the spin takes choice of courts, his opponent has first service; and vice versa.

The players change sides of the net at the end of the first, third, and every subsequent alternate game, and at the end of each set; but they may agree not to change during any set except the last. Service is delivered by each player in turn, who retains it for one game irrespective of the winning or losing of points. In doubles the partner of the server in the first game serves in the third, and the partner of the server in the second game serves in the fourth; the same order being preserved till the end of the set; but each pair of partners decide for themselves before their first turn of service which of the two shall serve first. The server delivers the service from the right- and left-hand courts alternately, beginning in each of his service games from the right-hand court, even though odd be given or owed; he must stand behind (i.e. farther from the net than) the base-line, and must serve the ball so that it drops in the opponent's service-court diagonally opposite to the court served from, or upon one of the lines enclosing that service-court. If in a serve, otherwise good, the ball touches the net, it is a "let" whether the serve be "taken" or not by striker-out; a "let" does not annul a previous "fault." (For the meaning of "let," "rest," "striker-out" and other technical terms used in the game, see Tennis and Racquets.) The serve is a fault (1) if it be not delivered by the server from the proper court, and from behind the base-line; (2) if the ball drops into the net or out-of-court, or into any part of the court other than the proper service-court. The striker-out cannot, as in racquets, "take," and thereby condone, a fault. When a fault has been served, the server must serve again from the same court, unless it was a fault because served from the wrong court, in which case the server crosses to the proper court before serving again. Two consecutive faults score a point against the side of the server. Lawn-tennis differs from tennis and racquets in that the service may not be taken on the volley by striker-out. After the serve has been returned the play proceeds until the "rest" (or "rally") ends by one side or the other failing to make a "good return"; a good return in lawn-tennis meaning a stroke by which the ball, having been hit with the racquet before its second bound, is sent over the net, even if it touches the net, so as to fall within the limits of the service-court of the player, or side, whose opponent fails to return the serve or to make a good return in the rest. A player also loses a point if the ball when in play touches him or his partner, or their clothes; or if he or his racquet touches the net or any of its supports while the ball is in play; or if he leaps over the net to avoid touching it; or if he volley the ball before it has passed the net.

For him who would excel in lawn-tennis a strong fast service is hardly less necessary than a heavily "cut" service to the tennis player and the racquet player. High overhead service, by which alone any great pace can be maintained, was first perfected by the brothers Renshaw between 1880 and 1885, and is now universal even among players far below the first rank. The service in vogue among the best players in America, and from this circumstance known as the "American service," has less pace than the English but is cut in such a way that it swerves to the side. When it drags off the ground, the advantage being that it gives the server more time to "run in" after his serve, so as to volley his opponent's return from a position within a yard or two of the net. Both in similar it doubles the ball's headroom over the net, but also makes it easier to get up comparatively near the net as soon as possible, whether they are serving or receiving the serve, the object being to volley the ball whenever possible before it begins to fall. The server's partner, in doing this, must stand about a yard and a half off the net, nearer the side-line than the half-court-line; the receiver of the service, not being allowed to volley the serve, must take his stand according to the nature of the service, which, if very fast, will require him to be well back; the rest usually stands between the net and the service-line. All four players, if the rest lasts beyond a stroke or two, are generally found nearer to the net than the service-lines; and the game, assuming the players to be of equal skill, consists chiefly of volleying and chipping the ball, varied by attempts on one side or the other to place the ball out of the opponents' reach by "lobbing" it over their heads into the back part of the court. Good "lobbing" demands great skill, to avoid on hitting it down the ball out of court beyond the base-line, and on the other allowing it to drop short enough for the adversary to kill it with a "smashing" volley. Of "lobbing" it has been laid down by the brothers Doherty that "the higher it is the better, so long as the length is good"; and as point's returning drop, the same authorities say, "you must get them if you can before they drop, for it is usually fatal to let them drop when playing against a good pair." The reason for this is that if the lob is allowed to drop before the server returns it, so much time is given to the opponent to gain position that he is almost certain to be able to kill the return, unless the lob be returned by an equally good and very high lob, dropping within a foot or so of the base-line in the opposite court, a stroke that is almost impossible to the novice and only possible to the man who is in relatively able to finish the rest by a smashing volley impossible to return. Ability to play this "smash" stroke is essential to strong lawn-tennis. To be good overhead," say the Dohertys, "is the sign of a great player. It is not the mark of a good player, even if a few have managed to do it without it."

The smash stroke is played very much in the same way as the overhead service, except that it is not from a defined position of known distance from the net; and therefore when making it the player must realize almost instantly what his position is in relation to the net and the side-lines, for it is of the last importance that he should not take his eye off the ball even for the hundredth part of a second. By drawing the racquet across the ball at the moment of impact spin may be imparted to it as in tennis, or a "side" or "top" is imparted to a bad ball, and the direction of spin...
and the consequent behaviour of the ball after the stroke may be greatly varied by a skilful player. Perhaps the most generally useful form of spin, though by no means the only one commonly used, is that known as "top" or "lift," a vertical rotary motion of the ball in the same direction as its flight, which is imparted to it by an upward draw of the racquet at the moment of making the stroke, and the effect of which is to make it drop more suddenly than it would ordinarily do, and in an unexpected curve. A drive made with plenty of "top" can be hit much harder than would otherwise be possible, and without snatching the ball out of court, and is therefore extensively employed by the best players. While the volleying game is almost universally the practice of first-class players—A. W. Gore, M. J. G. Ritchie and S. H. Smith being almost alone among those of the best rank in the game who have adopted it—the "out of court" game is followed with comparatively little—its difficulty places it beyond the reach of the less skilful. In lawn-tennis as played at the ordinary country house or local club the real "smash" of a Renshaw or a Doherty is seldom to be seen, and the first-class players of to-day make little use of the "out of court" tactics. They are content to take the ball on the bounce and to return it with some pace along the side-lines or across the court, with the aim of placing it as artfully as possible beyond the reach of the adversary; and if now and again they venture to imitate a stroke employed with telling effect at Wimbledon, they think themselves fortunate if they occasionally succeed in making it without disaster to themselves.

Before 1890 the method of handicapping at lawn-tennis was the same as in tennis so far as it was applicable to a game played in an open park; but in 1874 a new system was introduced by which fractional parts of "fifteen" could be conceded by way of handicap, in accordance with tables inserted in the laws of the game. The system is a development of the tennis handicapping practice in the United States, which was successful in that country. "One-sixth of fifteen" is one stroke given in every six games of a set; and similarly two-sixths, three-sixths, four-sixths and five-sixths of fifteen, are respectively two, three, four and five strokes given in every set that is played; the particular game in the set in which the stroke in each case must be given being specified in the tables.

History.—Lawn-tennis cannot be said to have existed prior to the year 1874. It is, indeed, true that outdoor games based on tennis were from time to time improvised by lovers of that game who found themselves out of reach of a tennis-court. Lord Arthur Hervey, sometime bishop of Bath and Wells, had thus devised a game which he and his friends played on the lawn of his rectory in Suffolk; and even so early as the end of the 18th century "field tennis" was mentioned by the Sporting Magazine as a game that rivalled the popularity of cricket.

But, however much or little this game may have resembled lawn-tennis, it had long ceased to exist; and even to be remembered, when in 1874 Major Wingfield took out a patent for a game called Sphairistike, which the specification described as "a new and improved portable court for playing the ancient game of tennis." The court for this game was divided into six parts, and the playing line was the centre line of the four sides, but the shape of an hour-glass; one side of the net only was divided into service courts, service being always delivered from a fixed mark in the centre of the opposite court; and from the net-posts side-nets were fixed which tapered down to the ground at about the middle of the side-lines, thus enclosing nearly half the courts on each side of the net. The possibilities of Sphairistike were quickly perceived; and under the new name of lawn-tennis its popularity grew so quickly that in 1875 a meeting of those interested in the game was held at Lord's cricket-ground, where a committee of the Marylebone Club (M.C.C.) was appointed to draw up a code of rules. The hour-glass shape of the court was retained by this code (issued in May 1875), and the scoring of the game followed in the main the racquets instead of the tennis model. It was at the suggestion of J. M. Heathcote, the amateur tennis champion, that balls covered with white flannel were substituted for the uncovered balls used at first. In 1875, through the influence of Henry Jones ("Cavendish"), lawn-tennis was included in the programme of the All England Croquet Club, which in 1877 became the All England Croquet and Lawn-Tennis Club, on whose grounds at Wimbledon these championships have been annually played since that date. In the same year, in anticipation of the first championship meeting, the club appointed a committee consisting of Henry Jones, Julian Marshall and C. G. Heathcote to revise the M.C.C. code of rules; the result of their labours being the introduction of the tennis in place of the racquets scoring, the substitution of a rectangular for the "hour-glass" court, and the enactment of the modern rule as regards the "fault." The height of the net, which under the M.C.C. rules had been 4 ft. in the centre, was reduced to 3 ft. 6 in.; and regulations as to the size and weight of the ball were also made. Some controversy had already taken place in the columns of the Field as to whether volleying the ball, at all events within a certain distance of the net, should not be prohibited. Spencer Gore, the first to win the championship in 1877, used the volley with great skill and judgment, and in principle anticipated the tactics afterwards brought to perfection by the Renshaws, which aimed at forcing the adversary back to the base-line and killing his return with a volley from a position near the net. P. F. Hadow, champion in 1878, showed how the volley might be defeated by skillful use of the lob; but the question of placing some check on the volley continued to be agitated among lovers of the game. The rapidly growing popularity of lawn-tennis was proved in 1879 by the inauguration at Oxford of the four-handed championship, and at Dublin of the Irish championship, and by the fact that there were forty-five competitors for the All England single championship at Wimbledon, won by J. T. Hartley, a player who chiefly relied on the accuracy of his return without frequent resort to the volley. It was in the autumn of the same year, in a tournament at Cheltenham, that W. H. Renshaw made his first appearance in public. The year 1880 saw the foundation of the Northern Lawn-Tennis Association, whose tournaments have long been regarded as inferior in importance only to the championship meetings at Wimbledon and Dublin, and a revision of the rules which substantially made them what they have ever since remained. This year is also memorable for the first championship doubles won by the twin brothers William and Ernest Renshaw, a success which the former followed up by winning the Irish championship, beating among others H. F. Lawford for the first time.

The Renshaws had already developed the volleying game at the net, and had shown what could be done with the "smash" stroke (which became known by their name as the "Renshaw smash "), but their service had not as yet become very severe. In 1881 the distinctive features of their style were more marked, and the brothers first established firmly the supremacy which they maintained almost without interruption for the next eight years. In the doubles they discarded the older tactics of one partner standing back and the other near the net; the two Renshaws stood about the same level, just inside the service-line, and from there volleyed with relentless severity and with no sign of lassitude if ever since; while their service also acquired an immense increase of pace. Their chief rival, and the leading exponent of the non-volleying game for several years, was H. F. Lawford. After a year or two it became evident that neither the volleying tactics of Renshaw nor the strong back play of Lawford would be adopted to the exclusion of the other, and both players began to combine the two styles. Thus the permanent features of lawn-tennis may be said to have been firmly established by about the year 1885; and the players who have since then come to the front have for the most part followed the principles laid down by the Renshaws and Lawford. One of the greatest performances at lawn-tennis was in the championship competition in 1886 when W. Renshaw beat Lawford a love set in 9½ minutes. The longest rest in first-class lawn-tennis occurred in a match between Lawford and E. Lubbock in 1886, when eighty-one strokes were played. Among players in the first class who were contemporaries of the Renshaws, mention should be made of E. de S. Browne, a powerful imitator of the Renshaw style: C. W. Grinstead, R. T. Richardson, V. Goold (who played under the nom de plume of J. S. Leiper), T. Hartley, E. W. Lewis, E. L. Williams, H. Groves and W. J. Hamilton; while among the most prominent lady players of the period were Miss M. Langrish, Miss Bradley, Miss Maud Watson, Miss L. Dod, Miss Martin and Miss Bingley (afterwards Mrs Hillyard). In 1888 the Lawn-Tennis Association was established; and the All England Mixed Doubles Championship (four-handed matches for ladies and gentlemen in partnership) was added to the existing annual competitions. Since 1881...
lawn-tennis matches between Oxford and Cambridge universities have been played annually; and almost every county in England, besides Scotland, Wales and districts such as "Midland Counties," "South of England," &c., have their own championship meetings. Tournaments are also played in winter at Nice, Monte Carlo and other Mediterranean resorts where most of the competitors are English visitors.

The results of the All England championships have been as follows:

In the United States lawn-tennis was played at Nahn, near Boston, within a year of its invention in England, Dr James Dwight and the brothers F. R. and R. D. Sears being mainly instrumental in making it known to their countrymen. In 1881 at a meeting in New York of representatives of thirty-three clubs the United States National Lawn-Tennis Association was formed; and the adoption of the English rules put an end to the mere desire of uniformity in size of the ball and height of the net which had hindered the progress of the game. The association decided to hold matches for championship of the United States at Newport, Rhode Island; and, by a curious coincidence, in the same year in which W. Renshaw first won the English championship, R. D. Sears won the first American championship by playing a volleying game at the net which entirely disconcerted his opponents, and he successfully defended his title for the next six years, winning the doubles throughout the same period in partnership with Dwight. In 1887, Sears being unable to play through ill-health, the championship went to H. W. Slocum. Other prominent players of the period were the brothers C. M. and J. S. Clark, who in 1883 came to England and decisively beaten at Wimbledon by the two Renshaws. To a later generation belong the strongest single players, M. D. Whitman, Holcombe Ward, W. A. Larned and Karl Behr. Holcombe Ward and Dwight Davis, who have the credit of introducing the peculiar "American twist service," were an exceedingly strong pair in doubles; but after winning the American doubles championship for three years in succession, they were defeated in 1902 by the English brothers R. F. and H. L. Doherty. The championship singles in 1904 and 1905 was won by H. Ward and B. C. Wright, the latter being one of the finest players America has produced; and these two in partnership won the doubles for three years in succession, until they were displaced by F. B. Alexander and H. H. Hackett, who in their turn held the doubles championship for a like period. In 1900 two young Californians, Long and McLoughlin, unexpectedly came to the front, and, although beaten in the final round for the championship doubles, they represented the United States in the contest for the Davis cup (see below) in Australia in that year; McLoughlin having acquired a service of extraordinary power and a smashing stroke with a reverse spin which was sufficient by itself to place him in the highest rank of lawn-tennis players.

In 1900 an international challenge cup was presented by the American D. F. Davis, to be competed for in the country of the holders. In the summer of that year a British team, consisting of A. W. Gore, E. D. Black and H. R. Barrett, challenged for the cup but were defeated by the Americans, Whitman, Larned, Davis and Ward. In 1902 a more representative British team, the two Dohertys and Pim, were again defeated by the same representatives of the United States; but in the following year the British lost to the Davis Cup to England by beating Larned and the brothers Wrenn at Longwood. In 1904 the cup was played for at Wimbledon, when representatives of Belgium, Austria and France entered, but failed to defeat the Dohertys and F. L. Riesle, who represented Great Britain. In 1905 the entries included France, Austria, Australasia, Belgium and the United States; in 1906 the same countries, except Belgium, competed; but in both years the British players withstood the attack. In 1907, however, when the contest was confined to England, the United States and Australasia, the latter was successful in winning the cup, which was then for the first time taken to the colonies, where it was retained in the following year when the Australians N. E. Brookes and A. F. Wilding defeated the representatives of the United States, who had previously beaten the English challengers in America. In 1909 England was not represented in the competition, and the Australians again retained the cup, beating the Americans McLoughlin and Long both in singles and doubles.

LAWRENCE (Laurentius, Lorenzo), ST. Christian martyr, whose name appears in the canon of the mass, and whose festival is on the 10th of August. The basilica reared over his tomb at Rome is still visited by pilgrims. His legend is very popular. Deacon of the pope (St) Sixtus (Xystus) II., he was called upon by the judge to bring forth the treasures of the church which had been committed to his keeping. He thereupon produced the church's poor people. Seeing his bishop, Sixtus, being led to punishment, he cried: "Father! whither goest thou without thy son? Holy priest! whither goest thou without thy deacon?" Sixtus prophesied that Lawrence would follow him in three days. The prophecy was fulfilled, and Lawrence was sentenced to be burnt alive on a gridiron. In the midst of his torments he addressed the judge in the words: "Assum est, versa et manducat ("I am roasted enough on his side; turn me round, and eat"). All these details of the legend are already related by St Ambrose (De Off. i. 41, ii. 28). The punishment of the gridiron and the speech of the martyr are probably a reminiscence of the Phrygian martyrs, as related by Socrates (iii. 15) and Sozomen (v. 11). But the fact of the martyrdom is unquestionable. The date is usually put at the persecution of Valerian in 258.

The cult of St Lawrence has spread throughout Christendom, and there are numerous churches dedicated to him, especially in England, where 228 have been counted. The Escurial was built in honour of St Lawrence by Philip II. of Spain, in memory of the battle of St Quentin, which was won in 1557 on the day of the martyr's festival. The meteorites which appear annually on or about the 10th of August are popularly known as "the tears of St Lawrence."

See Acta sanctorum, Augusti ii. 485-522; F. Franchi de Cavallieri, S. Lorenzo e il supplicio della gratifica (Rome, 1900); Ambrosiana Bollandiana, xix. 452 and 453; Fr. Arnold-Forster, Studies in Church Deductions or England's Patron Saints, i. 508-515, iii. 18, "Lorenz," vol. ii. 332 (H. D.).

LAWRENCE, AMOS (1786-1839), American merchant and philanthropist, was born in Groton, Massachusetts, U.S.A., on the 22nd of April 1786, a descendant of John Lawrence, Wiss, Suffolk, England, who was one of the first settlers of Groton. Leaving Groton academy (founded by his father, Samuel Lawrence, and others) in 1799, he became a clerk in a country store in Groton, whence after his apprenticeship he went, with $20 in his pocket, to Boston and there set up in business for himself in December 1807. In the next year he took into his employ his brother, Abbott (see below), whom he made his partner in 1814, the firm name being at first A. & A. Lawrence, and afterwards A. & A. Lawrence & Co. In 1831 when his health failed, Amos Lawrence retired from active business, and Abbott Lawrence was thereafter the head of the firm. The firm became the greatest American mercantile house of the day, was successful even in the hard times of 1812-1815, afterwards engaged particularly in selling woolen and cotton goods on commission, and did much for the establishment of the American textile industry in New England; in 1830 by giving to the aid of the financially depressed mills of Lowell, Massachusetts, where in that year the Spence, Trumount and Lawrence companies were established, and where Luther Lawrence, the eldest brother, represented the firm's interests; and in 1845-1847 by establishing and building up Lawrence, Massachusetts, named in honour of Abbott Lawrence, who was a director of the Essex company, which controlled the water power of Lawrence, and afterwards was president of the Atlantic Cotton Mills and Pacific Mills there. In 1842 Amos Lawrence decided not to allow his property to increase any further, and in the last eleven years of his life he spent in charity at least $525,000, a large sum
in those days. He gave to Williams college, to Bowdoin college, to the Bangor theological seminary, to Wabash college, to Kenyon college and to Groton academy, which was re-named Lawrence academy in honour of the family, and especially in recognition of the gifts of William Lawrence, Amos's brother; to the Boston children's infirmary, which he established, and (10,000) to the Bunker Hill monument fund; and, besides, he gave to many good causes on a smaller scale, taking especial delight in giving books, occasionally from a bundle of books in his satchel or carriage as he drove. He died in Boston on the 31st of December 1852.

See Extracts from the Diary and Correspondence of the late Amos Lawrence, with a Brief Account of Some Incidents in his Life (Boston, 1856), edited by his son William R. Lawrence.

His brother, Abbott Lawrence (1792-1855), was born in Groton, Massachusetts, on the 16th of December 1792. Besides being a partner in the firm established by his brother, and long its head, he promoted various New England railways, notably the Boston & Albany. He was a Whig representative in Congress in 1835-1837 and in 1839-1840 (resigning in September 1840 because of ill-health); and in 1842 was one of the commissioners for Massachusetts, who with commissioners from Maine and with Daniel Webster, secretary of state and plenipotentiary of the United States, settled with Lord Ashburton, the British plenipotentiary, the question of the north-eastern boundary. In 1842 he was presiding officer in the Massachusetts Whig convention; he broke with President Tyler, tacitly rebuked Daniel Webster for remaining in Tyler's cabinet after his colleagues had resigned; he recommended Henry Clay and John Davis as the nominees of the Whig party in 1844; an action that aroused Webster to make his famous Faneuil Hall address. In 1848 Lawrence was a prominent candidate for the Whig nomination for the vice-presidency, but was defeated by Webster's followers. He refused the portfolios of the navy and of the interior in President Taylor's cabinet, and in 1849-1852 was United States minister to Great Britain, where he was greatly aided by his wealth and his generous hospitality. He was an ardent protectionist, and represented Massachusetts at the Harrisburg convention in 1857. He died in Boston on the 15th of August 1855, leaving as his greatest memorial the Lawrence scientific school of Harvard university, which he had established by a gift of $50,000 in 1837 and to which he bequeathed another $50,000; in 1907-1908 this school was practically abolished as a distinct department of the university. He made large gifts to the Boston public library, and he left $50,000 for the erection of model lodging-houses, thus carrying on the work of an Association for building model lodging-houses for the poor, organized in Boston in 1837.

See Hamilton A. Hill, Memoir of Abbott Lawrence (Boston, 1884). "Randolph Andreas' Der Weg zum Glück, oder die Kunst Millionär zu werden (Berlin, 1856)" is a pretended translation of moral maxims from a supposititious manuscript bequeathed to Abbott Lawrence by a rich uncle.

Lawrence, Amos Adams (1814-1866), American philanthropist, son of Amos Lawrence, was born in Groton, Massachusetts, U.S.A., on the 31st of July 1814. He graduated at Harvard in 1835, went into business in Lowell, and in 1837 established in Boston his own counting-house, which from 1835 to 1838 was the firm of Lawrence & Mason, and which was a selling agent for the Cocheco mills of Dover, New Hampshire, and for other textile factories. Lawrence established a hosiery and knitting mill at Ipswich—the first of importance in the country—and was a director in many large corporations. He was greatly interested in the claims of Eleazer Williams of Green Bay, Wisconsin, and through loans to this "lost dauphin" came into possession of much land in Wisconsin; in 1840 he founded at Appleton, Wisconsin, a school named in his honour Lawrence university (now Lawrence college). He also contributed to funds for the colonization of free negroes in Liberia. In 1854 he became treasurer of the Massachusetts Emigrant Aid Company (reorganized in 1855 as the New England Emigrant Aid Company), which sent 1300 settlers to Kansas, where the city of Lawrence was named in his honour. He contributed personally for the famous Sharpe rifles, which, packed as "books" and "primers," were shipped to Kansas and afterwards came into the hands of John Brown, who had been a protégé of Lawrence. During the contest in Kansas, Lawrence wrote frequently to President Pierce (his mother's nephew) in behalf of the free-state settlers; and when John Brown was arrested he appealed to the governor of Virginia to secure for him a lawful trial. On Robinson and others in Kansas he repeatedly urged the necessity of offering no armed resistance to the Federal government; and he deplored Brown's fanaticism. In 1858 and in 1860 he was the Whig candidate for governor of Massachusetts. Till the very outbreak of the Civil War he was a "law and order" man, and he did his best to secure the adoption of the Crittenden compromise; but he took an active part in drilling troops, and in 1862 he raised a battalion of cavalry which became the 2nd Massachusetts Regiment of Cavalry, of which Charles Russell Lowell was colonel. Lawrence was a member of the Protestant Episcopal Church and built (1873-1880) Lawrence hall, Cambridge, for the Episcopal theological school, of which he was treasurer. In 1857-1862 he was treasurer of Harvard college, and in 1876-1885 an overseer. He died in Nahant, Mass., on the 22nd of August 1886.

See William Lawrence, Life of Amos A. Lawrence, with Extracts from his Diary and Correspondence (Boston, 1888).

His son, William Lawrence (1835—?), graduated in 1871 at Harvard, and in 1875 at the Episcopalian theological school, where, after being rector of Grace Church, Lawrence, Mass., in 1876-1884, he was professor of homiletics and natural theology in 1884-1893 and dean in 1888-1893. In 1893 he succeeded Phillips Brooks as Protestant Episcopal bishop of Massachusetts. He wrote A Life of Roger Wolcott, Governor of Massachusetts (1902).

Lawrence, George Alfred (1827-1876), English novelist, was born at Braxted, Essex, on the 25th of March 1827, and was educated at Rugby and at Balliol college, Oxford. He was called to the bar at the Inner Temple in 1854, but soon abandoned the law for literature. In 1857 he published, anonymously, his first novel, Guy Livingstone, or, Thorough. The book achieved a very large sale, and had nine or ten successors of a similar type, the best perhaps being Sword and Gown (1859). Lawrence may be regarded as the originator in English fiction of the beef sabreur type of hero, great in sport and love and war. He died at Edinburgh on the 23rd of September 1876.

Lawrence, Sir Henry Montgomery (1806-1857), British soldier and statesman in India, brother of the 1st Lord Montgomery (q.v.), was born at Matara, Ceylon, on the 28th of June 1806. He inherited his father's stern devotion to duty and Celtic impulsiveness, tempered by his mother's gentleness and power of organization. Early in 1823 he joined the Bengal Artillery at the Calcutta suburb of Dum Dum, where also Henry Havelock was stationed about the same time. The two officers pursued a very similar career, and developed the same Puritan character up to the time that both died at Lucknow in 1857. In the first Burmese War Henry Lawrence and his battery formed part of the Chittagong column which General Morrison led over the jungle-covered hills of Arakan, till fever decimated the officers and men, and Lawrence found himself at home again, wasted by a disease which never left him. On his return to India with his younger brother John in 1829 he was appointed revenue surveyor by Lord William Bentinck. At Qorakpur the wonderful personal influence which radiated from the young officer formed a school of attached friends and subordinates who were always eager to serve under him. After some years spent in camp, during which he had married his cousin Honoria Marshall, and had surveyed every village in four districts, each larger than Yorkshire, he was recalled to a brigade by the outbreak of the first Afghan War towards the close of 1838. As assistant to Sir George Clerk, he now added to his knowledge of the people political experience in the management of the district of Ferozepore; and when disaster came he was sent to Peshawar in order to push up supports for the relief of Sale and the garrison of Jalalabad. The war had been
begun under the tripartite treaty signed at Lahore on the 20th of June 1838. But the Sikhs were shown to play their part after the calamities in Afghanistan. No one but Henry Lawrence could manage the disorderly contingent which they reluctantly supplied to Pollock's avenging army in 1842. He helped to force the Khyber Pass on the 5th of April, playing his guns from the heights, for 8 and 20 m. In recognition of his services Lord Ellenborough appointed him to the charge of the valley of Dehra Dun and its hill stations, Mussoorie and Landour, where he first formed the idea of asylums for the children of European soldiers. After a month's experience there it was discovered that the appointment was the legal right of the civil service, and he was transferred, as assistant to the envoy at Lahore, to Umballa, where he reduced to order the lapsed territory of Kaithal. Soon he received the office of resident at the protected court of Nepal, where, assisted by his wife, he began a series of contributions to the Calcutta Review, a selected volume of which forms an Anglo-Indian classic. There, too, he elaborated his plans which resulted in the erection and endowment of the noblest philanthropic establishments in the East—the Lawrence military asylums at Sanaun (on the road to Simla), at Murree in the Punjab, at Mount Abu in Rajputana, and at Loversdale in the Madras Nilgiris. From 1844 to his death he devoted all his income, above a modest pittance for his children, to this and other forms of charity.

The Review articles led the new governor-general, Lord Hardinge, to summon Lawrence to his side during the first Sikh War; and not these articles only. He had published the results of his experience of Sikh rule and soldiering in a vivid work, the Adventures of an Officer in the Service of Ranjit Singh (1843), in which he vainly attempted to disguise his own personality and exploits. After the doubtful triumphs of Moodkee and Ferozshah Lawrence was summoned from Nepal to take the place of Major George Broadfoot, who had fallen. Allwai came: then the guns of Sobroan chased the demoralized Sikhs across the Sutlej. All through the smoke Lawrence was at the side of the governor-general. He gave his voice, not for the rescue of the people from anarchy by annexation, but for the reconstruction of the Sikh government, and was himself appointed resident at Lahore, with power "over every department and to any extent" as president of the council of regency till the maharaja Dhuleep Singh should come of age. Soon disgusted by the "venal and selfish durbar" who formed his Sikh colleagues, he summoned to his side assistants like Nicholson, James Abbott and Edwards, till they all did too much for the people, as he regretfully confessed. But "my chief confidence was in my brother John, . . . who gave me always such help as only a brother could." Wearied out he went home with Lord Hardinge, and was made K.C.B., when the second Sikh War summoned him back at the end of 1848 to see the whole edifice of Sikh "reconstruction" collapse. It fell to Lord Dalhousie to proclaim the Punjab up to the Khyber British territory on the 29th of March 1849. But still another compromise was tried. As the best man to reconcile the Sikh chiefs to the inevitable, Henry Lawrence was selected for the purpose. He was placed in charge of the political duties, and his brother John was entrusted with the finances. John could not find the revenue necessary for the rapid civilization of the new province so long as Henry would, for political reasons, insist on granting life pensions and alienating large estates to the needy remnants of Ranjit Singh's court. Lord Dalhousie deliberately but firmly removed Sir Henry Lawrence to the charge of the great nobles of Rajputana, and installed John as chief commissioner. If resentment burned in Henry's heart, it was not against his younger brother, who would fain have retired. To him he said, "If you preserve the peace of the country and make the people high and low happy, I shall have no regrets that I vacated the field for you."

In the comparative rest of Rajputana he once more took up the pen as an army reformer. In March and September 1856 he published two articles, called forth by conversations with Lord Dalhousie at Calcutta, whither he had gone as the hero of a public banquet. The governor-general had vainly warned the home authorities against reducing below 14,000 the British garrison of India even for the Crimean War, and had sought to improve the position of the sepoys. Lawrence pointed out the latent causes of mutiny, and uttered warnings to be too soon justified. In March 1857 he yielded to Lord Canning's request that he should then take the helm at Lucknow, but it was too late. In ten days his magic rule put down administrative difficulties indeed, as he had done at Lahore. But what could even he effect with only 700 European soldiers, when the epidemic spread after the Meerut outbreak of mutiny on the 10th of May? In one week he had completed those preparations which made the defence of the Lucknow residency for ever memorable. Amid the deepening gloom Lord Canning ever wrote of him as "a tower of strength," and he was appointed provisional governor-general. On the 30th of May mutiny burst forth in Oudh, and he was ready. On the 29th of June, pressed by fateful colleagues, and wasted by unceasing toil, he led 336 British soldiers with 11 guns and 220 natives out of Chintah to reconnoitre the insurgents, when the natives joined the enemy and the residency was besieged. On the 2nd of July, as he lay exhausted by the day's work and the terrific heat in an exposed room, a shell struck him, and in forty-eight hours he was no more. A baronetcy was conferred on his son. A marble statue was placed in St Paul's as the national memorial of one who has been declared to be the noblest man that has lived and died for the good of India.

His biography was begun by Sir Herbert Edwardes, and completed (2 vols. 1872) by Herman Merivale. See also J. J. McLeod Innes, Sir John Lawrence ("Rules of India" series), 1898.

**LAURENCE, JOHN LAIRD MAIR LAWRENCE, 1ST BARON (1811-1879), viceroy and governor-general of India, was born at Richmond, Yorkshire, on the 24th of March 1811. His father, Colonel Alexander Lawrence, volunteered for the forlorn hope at Seringapatam in presence of Baird and of Wellington, whose friend he became. His mother, Letitia Knox, was a collateral descendant of John Knox. To this couple were born twelve children, of whom three became famous in India, Sir George St. Patrick, Sir Henry (q.v.) and Lord Lawrence. Irish Protestants, the boys were trained at Boyle college, Derry, and at Clifton, and received Indian appointments from their mother's cousin, John Hudson, who had been the friend of Schwartz in Tanjore. In 1829, when only seventeen, John Lawrence landed at Calcutta as a civilian; he mastered the Persian language at the college of Fort William, and was sent to Delhi, on his own application, as assistant to the collector. The position was the most dangerous and difficult to which a Bengal civilian could be appointed at that time. The titular court of the pensioner who represented the Great Mogul was the centre of that disaffection and sensuality which found their opportunity in 1857. A Musulman rabble filled the city. The district around, stretching from the desert of Rajputana to the Jumna, was slowly recovering from the anarchy to which Lord Lake had given the first blow. When not administering justice in the city courts or under the village tree, John Lawrence was scouring the country in the saddle, often after the marauding Meos and Mahotics in a bee-keeper's blanket. His keen insight and sleepless energy at once detected the murderer of his official superior, William Fraser, in 1835, in the person of Shams-uddin Khan, the nawab of Loharu, whose father had been raised to the principality by Lake, and the assassin was executed. The first twenty years, from 1829 to 1849, during which John Lawrence acted as the magistrate and land revenue collector of the most turbulent and backward portion of the Indian empire as it then was, formed the period of the reforms of Lord William Bentinck. To what became the lieutenant-governorship of the North-Western (now part of the United) Provinces Lord Wellesley had promised the same permanent settlement of the land-tax which Lord Cornwallis had made with the large landholders or zamindars of Bengal. The court of directors, going to the opposite extreme, had sanctioned leases for only five years, so that agricultural progress was arrested. In 1833 Merttha Bird and James Thomson introduced the system of thirty years' leases based on a careful
survey of every estate by trained civilians, and on the mapping of every village holding by native subordinates. These two revenue officers created a school of enthusiastic economists who rapidly registered and assessed an area as large as that of Great Britain, with a rural population of twenty-three millions. Of that school John Lawrence proved the most ardent and the most renowned. Intermittently his work at Delhi, he became land revenue settlement officer in the district of Etawah, and there began, by buying out or getting rid of the talukdars, to realize the ideal which he did much to create throughout the rest of his career—a country “thickly cultivated by a fat contented yeomanry, each man riding his own horse, sitting under his own fig-tree, and enjoying his rude family comforts.” This and a quiet persistent hostility to the oppression of the people by their chiefs formed the two features of his administrative policy throughout life.

It was fortunate for the British power that, when the first Sikh War broke out, John Lawrence was still collector of Delhi. The critical engagements at Ferozeshah, following Moodkee, and hardly redeemed by Aliswal, left the British army somewhat exhausted at the gate of the Punjab, in front of the Sikh entrenchments on the Sutlej. For the first seven weeks of 1846 there poured into camp, day by day, the supplies and munitions of war which this one man raised and pushed forward, with all the influence acquired during fifteen years of an iron yet sympathetic rule in the land between the Jumna and the Sutlej. The crowning victory of Sobraon was the result, and at thirty-five Lawrence became commissioner of the Jullundur Doab, the fertile belt of hill and dale stretching from the Sutlej north to the Indus. The still youthful civilian did for the newly annexed territory what he had long before accomplished in and around Delhi. He restored it to order, without one regular soldier. By the fascination of his personal influence he organized levies of the Sikhs who had just been defeated, led them now against a chiefs. He cleared the hills and now storm the fort of a rai in the lower, till he so welded the people into a loyal mass that he was ready to repeat the service of 1846 when, three years after, the second Sikh War ended in the conversion of the Punjab up to Peshawar into a British province.

Lord Dalhousie had to devise a government for a warlike population now numbering twenty-three millions, and covering an area little less than that of the United Kingdom. The first results were not hopeful; and it was not till John Lawrence became chief commissioner, and stood alone face to face with the chiefs and people and ring fence of still untamed border tribes, that there became possible the most successful experiment in the art of civilizing turbulent millions which history presents. The province was mapped out into districts, now numbering thirty-two, in addition to thirty-six tributary states, small and great. To each the thirty years’ leases of the north-west settlement were applied, after a patient survey and assessment by skilled officials ever in the saddle or the tent. The revenue was raised on principles so fair to the peasantry that Ranjit Singh’s reductions were reduced by a fourth, while agricultural improvements were encouraged. For the first time in its history since the earliest Aryan settlers had been overwhelmed by successive waves of invaders, the soil of the Punjab came to have a marketable value, which every year of British rule has increased. A stalwart police was organized; roads were cut through every district, and canals were constructed. Commerce followed on increasing cultivation and communications, courts brought justice to every man’s door, and crime hid its head. The adventurous and warlike spirits, Sikh and Mahomedan, found a career in the new force of irregulars directed by the chief commissioner himself, while the Afghan, Dost Mahomed, kept within his own fastnesses, and the long extent of frontier posts of the passes was patrolled.

Seven years of such work prepared the lately hostile and always anarchic Punjab under such a pilot as John Lawrence not only to weather the storm of 1857 but to lead the older provinces into port. On the 12th of May the news of the tragedies at Meerut and Delhi reached him at Rawalpindi. The position was critical in the last degree, for of 50,000 native soldiers 38,000 were Hindustanis of the very class that had mutinied elsewhere, and the British troops were few and scattered. For five days the fate of the Punjab hung upon a thread, for the question was, “Could the 12,000 Punjabis be trusted and the 38,000 Hindustanis be disarmed?” Not an hour was lost in beginning the disarming at Lahore; and, as one by one the Hindustani corps succumbed to the epidemic of mutiny, the sepoys were deported or disappeared, or swelled the military rabble in and around the city of Delhi. The remembrance of the ten years’ war which had closed only in 1849, a bountiful harvest, the old love of battle, the offer of good pay, but, above all, the personality of Lawrence and his officers, raised the Punjabi force into a new army of 50,000 men, and induced the non-combatant classes to subscribe to a 6% loan. Delhi was invested, but for three months the rebel city did not fall. Under John Nicholson, Lawrence sent on still more men to the siege, till every available European and faithful native soldier was there, while a movable column swept the country, and the border was kept by an improvised militia. At length, when even in the Punjab confidence became doubt, and doubt distrust, and that was passing into disillusion, John Lawrence was ready to consider whether we should not give up the Peshawar valley to the Afghans as a last resource, and send its garrison to recruit the force around Delhi. Another week and that alternative must have been faced. But on the 20th of September the city and palace of Delhi were again in British hands, and the chief commissioner and his officers united in ascribing “to the Lord our God all the praise due for nerving the hearts of our statesmen and the arms of our soldiers.” As Sir John Lawrence, Bart., G.C.B., with the thanks of parliament, the gratitude of his country, and a life pension of £2000 a year in addition to his ordinary pension of £1000, the “behaviour of India” returned home in 1859. After guarding the interests of India and its people as a member of the secretary of state’s council, he was sent out again in 1864 as viceroy and governor-general on the death of Lord Elgin. If no great crisis enabled Lawrence to increase his reputation, his five years’ administration of the whole Indian empire was worthy of the ruler of the Punjab. His foreign policy has become a subject of imperial interest, his name being associated with the “close border” as opposed to the “forward” policy; while his internal administration was remarkable for financial prudence, a jealous regard for the good of the masses of the people and of the British soldiers, and a generous interest in education, especially in its Christian aspects.

When in 1854 Dost Mahomed, weakened by the antagonism of his brothers in Kandahar, and by the interference of Persia, sent his son to Peshawar to make a treaty, Sir John Lawrence was opposed to any entangling relation with the Afghans after the experience of 1838-1842, but he obeyed Lord Dalhousie so far as to sign a treaty of perpetual peace and friendship. His ruling idea, the fruit of long and sad experience, was that de facto powers only should be recognized beyond the frontier. When in 1863 Dost Mahomed’s death let loose the factions of Afghanistan he acted on this policy to such an extent that he recognized both the sons, Afsul Khan and Shere Ali, at different times, and the latter fully only when he had made himself master of all his father’s kingdom. The steady advance of Russia from the north, notwithstanding the Gr-rتخاکر قيكار of 1864, led to severe criticism of this cautious “buffer” policy which he justified under the term of “masterly inactivity.” But he was ready to receive Shere Ali in confidence, and to aid him in consolidating his power after it had been established and maintained for a time, when his term of office came to an end and it fell to Lord Mayo, his successor, to hold the Umballa conference in 1890. When, nine years after, the second Afghan War was precipitated, the retired viceroy gave the last days of his life to an unsparing exposure, in the House of Lords and in the press, of a policy which he had striven to prevent in its inception, and which he did not cease to denounce in its course and consequences.

On his final return to England early in 1890, after forty years’
service in and for India, "the great proconsul of our English Christian empire" was created Baron Lawrence of the Punjab, and of Gravesend, Kent. He assumed the same arms and crest as those of his brother Henry, with a Paphian and a Sikh trooper as supporters, and took as his motto "Be ready," his brother's being "Never give in." For ten years he gave himself to the work of the London school board, of which he was the first chairman, and of the Church missionary society. Towards the end he eyesight failed, and on the 27th of June 1879 he died at the age of sixty-eight. He was buried in the nave of Westminster Abbey, beside Clyde, Outram and Livingstone. He had married the daughter of the Rev. Richard Hamilton, Harriette-Katherine, who survived him, and he was succeeded as 2nd baron by his eldest son, John Hamilton Lawrence (b. 1846).

See Bosworth Smith, Life of Lord Lawrence (1885); Sir Charles Altichon, Lord Lawrence "Rulers of India" series, 1892; L. J. Trotter, Lord Lawrence (1880); and F. M. Holmes, Four Heroes of India.

LAWRENCE, STRINGER (1667-1775), English soldier, was born at Hereford on the 6th of March 1667. He seems to have entered the army in 1727 and served in Gibraltar and Flanders, subsequently taking part in the battle of Culloden. In 1748, with the rank of major and the reputation of an experienced soldier, he went out to India to command the East India Company's troops. Dupleix's attempts for the French conquest of southern India were on the point of taking effect, and not long after his arrival at Fort St David, Stringer Lawrence was actively engaged. He successfully foiled an attempted French surprise at Cuddalore, but subsequently was captured by a French cavalry patrol at Ariancopang near Pondicherry and kept prisoner till the peace of Aix-la-Chapelle. In 1749 he was in command at the capture of Devicota. On this occasion Clive served under him and a life-long friendship began. On one occasion, when Clive had become famous, he honoured the creator of the Indian army by refusing to accept a sword of honour unless one was voted to Lawrence also. In 1750 Lawrence returned to England, but in 1752 he was back in India. Here he found Clive in command of a force intended for the relief of Trichinopoly. As senior officer Lawrence took over the command, but was careful to allow Clive every credit for his share in the subsequent operations, which included the relief of Trichinopoly and the surrender of the entire French besieging force. In 1752 with an inferior force he held out against the French at Pondicherry, 1753, and relieved Trichinopoly. For the next seventeen months he fought a series of actions in defence of this place, finally arranging a three months' armistice, which was afterwards converted into a conditional treaty. He had commanded in chief up to the arrival of the first detachment of regular forces of the crown. In 1757 he served in the operations against Wandiwash, and in 1758-1759 was in command of Fort St George during the siege by the French under Lally. In 1759 falling health compelled him to return to England. He resumed his command in 1761 as major-general and commander-in-chief. Clive supplemented his old friend's inconsiderable income by settling on him an annuity of £500 a year. In 1765 he presided over the board charged with arranging the reorganization of the Madras army, and he finally retired the following year. He died in London on the 10th of January 1775. The East India Company erected a monument to his memory in Westminster Abbey.

See Biddulph, Stringer Lawrence.

LAWRENCE, SIR THOMAS (1760-1830), English painter, was born at Bristol on the 4th of May 1760. His father was an innkeeper, first at Bristol and afterwards at Devizes, and at the age of six Thomas was already shown off to the guests of the Black Boar as an infant prodigy who could sketch their likenesses and declaim speeches from Milton. In 1779 the elder Lawrence had to leave Devizes, having failed in business, and the precocious talent of the son, who had gained a sort of reputation along the Bath road, became the support of the family. His debut as a crayon portrait painter was made at Oxford, where he was well patronized, and in 1782 the family settled in Bath, where the young artist soon found himself fully employed in taking crayon likenesses of the fashionable people at a guinea or a guinea and a half a head. In 1784 he gained the prize and silver-gilt palette of the Society of Arts for a crayon drawing after Raphael's "Transfiguration," and presently beginning to paint in oil. Throwing aside the idea of going on the stage which he had for a short time entertained, he came to London in 1787, was kindly received by Reynolds, and entered as a student at the Royal Academy. He began to exhibit almost immediately, and his reputation increased so rapidly that he became an associate of the Academy in 1791. The death of Sir Joshua in 1792 opened the way to further successes. He was at once appointed painter to the Diletanti society, and principal painter to the king in room of Reynolds. In 1794 he was a Royal Academician, and he became the fashionable portrait painter of the age, having as his sitters all the rank, fashion and talent of England, and ultimately most of the crowned heads of Europe. In 1813 he was knighted; in 1818 he went to Aix-la-Chapelle to paint the sovereigns and diplomats gathered there, and visited Vienna and Rome, everywhere receiving flattering marks of distinction from princes, due as much to his courtly manners as to his merits as an artist. After eighteen months he returned to London, and on the 10th of December 1819 died, leaving his widow as his executrix. It seems almost an involuntary punishment that his son should have died shortly before him in 1820. The offers of his portraits were at first so numerous that he could not possibly attend to them all. Lawrence could do no more than take a general view of the city, and the result of his efforts in the direction of his painting was a large collection of magnificent portraits. His success was such that he could, during his last years, LIVE contentedly in the house which had been his birthplace at Bristol. It was the house of the family, and it was there that he died on the 7th of January 1830. He was never married.

Sir Thomas Lawrence had all the qualities of personal manner and artistic style necessary to make a fashionable painter, and among English portrait painters he takes a high place, though not as high as that given to him in his lifetime. His more ambitious works, in the classical style, such as his once celebrated "Satan," are practically forgotten.

The best display of Lawrence's work is in the Waterloo Gallery of Windsor, a collection of much historical interest. "Master Lawrence," has been said, "painted for Lord Dufferin at the price of 500 guineas, is regarded as one of his best portraits, and a fine head in the National Gallery, London, shows his power to advantage. The Life and Correspondence of Sir T. Lawrence, by D. E. Williams, appeared in 1831.

LAWRENCE, a city and the county-seat of Douglas county, Kansas, U.S.A., situated on both banks of the Kansas river, about 20 m. W. of Kansas City. Pop. (1890) 600 guineas, (1900) 10,862, of whom 2032 were negroes. (1910 census) 12,734. It is served by the Atchison, Topeka & Santa Fe and the Union Pacific railways, both having tributary lines extending N. and S. Lawrence is surrounded by a good farming region, and is itself a thriving educational and commercial centre. Its site slopes up from the plateau that borders the river to the heights above, from which there is a view of rare beauty. Among the city's principal public buildings are the court house and the Y.M.C.A. building. The university of Kansas, situated on Mount Oread, overlooking the city, was first opened in 1866, and in 1907-1908 had a faculty of 105 and 2663 students, including 702 women (see KANSAS). Just S. of the city of Lawrence is Haskell institute (1884), one of the largest Indian schools in the country, maintained for children of the tribal Indians by the national government. In 1907 the school had 813 students, of whom 313 were girls; it has an academic department, a business school and courses in domestic science, in farming, dairying and gardening, and in masonry, carpentry, painting, blacksmithing, wagon-making, shoemaking, steam-fitting, printing and other trades.

Among the city's manufactures are flour and gist mill products, pianos and cement plaster. Lawrence, named in honour of Amos A. Lawrence, was founded by agents of the Massachusetts Emigrant Aid Company in July 1854, and during the Territorial period was the political centre of the free-state cause and the principal point against which the assaults of the pro-slavery party were directed. It was first known as Wakarusa, from the creek by which it lies. A town association was organized in September 1854 before any Territorial government had been established. In the next month some pro-slavery men presented claims to a part of the land, projected a rival town to be called E xcelsior on the same site, and threatened violence; but when Lawrence had organized its "regulators" the pro-slavery men retired and later agreed to a compromise by which the town
site was limited to 640 acres. In December 1855 occurred the "Wakarusa war." A free-state man having been murdered for his opinions, a friend who threatened retaliation was arrested by the pro-slavery sheriff, S. J. Jones; he was rescued and taken to Lawrence; the city disclaimed complicity, but Jones persuaded Governor Wilson Shannon that there was rebellion, and Shannon authorized a posse; Missouri responded, and a pro-slavery force marched on Lawrence. The governor found that Lawrence had not resisted and would not resist the service of writs; by a written "agreement" with the free-state leaders he therefore withdrew his sanction from the Missourians and averted battle. The retreating Missourians committed some homicides. It was during this "war" that John Brown first took up arms with the free-state men. Preparations for another attack continued, particularly after Sheriff Jones, while serving writs in Lawrence, was killed. On the 21st of May 1856, at the head of several hundred Missourians, he occupied the city without resistance, destroyed its printing offices and the free-state headquarters and pillaged private houses. In 1855 and again in 1857 the pro-slavery Territorial legislature passed an Act giving Lawrence a charter, but the people of Lawrence would not recognize that "bogus" government, and on the 13th of July 1857, after an application to the Topeka free-state legislature for a charter had been denied, adopted a city charter of their own. Governor Walker proclaimed this rebellion against the United States, appeared before the town in command of 400 United States dragoons and declared it under martial law; as perfect order prevailed, and there was no overt resistance to Territorial law, the troops were withdrawn after a few weeks by order of President Buchanan, and in February 1858 the legislature passed an Act legalizing the city charter of July 1857. On the 21st of August 1863 William C. Quantrell and some 400 mounted Missourians bushwhackers surprised the sleeping town and murdered 150 citizens. The city's arms were in storage and no resistance was possible. This was the most distressing episode in all the turbulence of territorial days and border warfare in Kansas. A monument erected in 1895 commemorates the dead. After the free-state men gained control of the Territorial legislature in 1857 the legislature regularly adjourned from Lecompton, the legal capital, to Lawrence, which was practically the capital until the choice of Topeka under the Wyandotte constitution. The first railway to reach Lawrence was the Union Pacific in 1864.

LAWRENCE, a city, and one of the three county-seats (Salem
and Newburyport are the others) of Essex county, Massachusetts, U.S.A., on both sides of the Merrimac river, about 30 m. from its mouth and about 26 m. N.N.W. of Boston. Pop. (1890) 44,654, (1900) 62,559, of whom 28,577 were foreign-born (7058
being Irish, 6999 French Canadians, 5131 English, 2456
German, 1683 English Canadian), and (1910 census) 85,892.
It is served by the Boston & Maine railroad and by electric railways to Andover, Boston, Lowell, Haverhill and Salem, and to Nashua and Salem, New Hampshire. The city's area of 6-54 sq. m. is about equally divided between hills and valleys; the latter is crossed by a great stone dam 4,000 ft. long, and, with a fall of 28 ft., supplies about 12,000 horse-
power. Water from the river is carried to factories by a canal on each side of the river and parallel to it; the first canal was built on the north side in 1845-1847 and is 1 m. long; the canal on the south side is about 4m. long, and was built several years later. There are large and well-kept public parks, a common (17 acres) with a soldiers' monument, a free public library, with more than 50,000 volumes in 1907, a city hall, county and municipal court-houses, a county gaol and house of correction, a county industrial school and a state armoury.

The value of the city's factory product was $48,036,593 in 1905, $41,741,986 in 1900. The manufacture of textiles is the most important industry; in 1905 the city produced worsteds valued at $30,026,964 and cotton goods worth $5,745,611, theworsted product being greater than that of any other American city. The Woodworsted mill here is said to be the largest single mill in the world. The history of Lawrence is largely the history of its textile mills. The town was formed in 1845 from parts of Andover (S. of the Merrimac) and of Methuen (N. of the river), and it was incorporated as a town in 1847, being named in honour of Abbott Lawrence, a director of the Essex company, organized in 1845 (on the same day as the formation of the town) for the control of the water power and for the construction of the great dam across the Merrimac. The Bay State woolen mills, which in 1838 became the Washington mills, and the Atlantic cotton mills were both charted in 1846. The Pacific mills (1853) introduced from England in 1854 Lister combs for worsted manufacture; and the Washington mills soon afterward began to make worsted dress goods. On the worsted trade the men's wear seems to have been made first about 1870 in the same time in the Washington mills here, in the Hockanum mills of Rockville, Connecticut, and in Wanskuck mills, Providence, Rhode Island. The Pemberton mills, built in 1853, collapsed and afterwards took fire on the 10th of January 1860; 90 were killed and hundreds severely injured. Lawrence was chartered as a city in 1853, and annexed a small part of Methuen in 1854 and parts of Andover and North Andover in 1879.

See H. A. Wadsworth, History of Lawrence, Massachusetts (Lawrence, 1880).

LAWRENCEBURG, a city and the county-seat of Dearborn
county, Indiana, U.S.A., on the Ohio river, in the S.E. part
of the state, 22 m. (by rail) W. of Cincinnati. Pop. (1890) 4284,
(1900) 4326 (475 foreign-born); (1910) 3958. Lawrenceburg is
served by the Baltimore & Ohio South-Western and the Cleveland, Cincinnati, Chicago & St. Louis railways, by the Cincinnati, Lawrenceburg & Aurora electric street railroad, and by river
packets to Louisville and Cincinnati. The city lies along the river and on higher land rising 100 ft. above river-level. It formerly had an important river trade with New Orleans, beginning about 1820 and growing in volume after the city became the terminus of the Whitewater canal, begun in 1836. The place was laid out in 1802. In 1846 an "old" and a "new" settlement were united, and Lawrenceburg was chartered as a city. Lawrence-
burg was the birthplace of James B. Eads, the famous engineer, and of John Coit Spooner (b. 1843), a prominent Republican
member of the United States Senate from Wisconsin in 1885-
1891 and in 1897-1907; and the Presbyterian Church of Law-
renceburg was the first charge (1837-1839) of Henry Ward
Beecher.

LAWSON, CECIL GORDON (1851-1882), English landscape
painter, was the youngest son of William Lawson of Edinburgh, esteemed as a portrait painter. His mother also was known
for her flower pieces. He was born near Shrewsbury on the
3rd of December 1851. Two of his brothers (one of them,
Malcolm, a clever musician and song-writer) were trained as
artists, and Cecil was from childhood devoted to art with the intensity of a serious nature. Soon after his birth the Lawsons moved to London. Lawson's first works were studies of fruit,
flowers, &c., in the manner of W. Hunt; followed by Riverside
Chelsea subjects. His first exhibit at the Royal Academy (1870) was "Chevy Chase," and in 1871 he sent two other
paintings. These gained full recognition from fellow-
artists, if not from the public. Among his friends were now
numbered Fred Walker, G. J. Pinwell and their associates.
Following them, he made a certain number of drawings for
wood-engraving. Lawson's Chelsea pictures had been painted in somewhat low and sombre tones; in the "Hymn to Spring" of 1872 (rejected by the Academy) he turned to a more joyous play of colour, helped by work in more romantic scenes in North
Wales and Ireland. Early in 1874 he made a short tour in
Holland, Belgium and Paris; and in the summer he painted his
large "Hop Gardens of England." This was much praised
at the Academy of 1876. But Lawson's triumph was with the
great luxuriant canvas "The Minister's Garden," exhibited in
1878 at the Grosvenor Gallery, and now in the Manchester
Art Gallery. This was followed by several works conceived
in a new and tragic mood. His health began to fail, but he worked on. He married in 1879 the daughter of Birnie Philip, and settled at Haslemere. His later subjects are from this neighbourhood (the most famous being "The August Moon," now in the National Gallery of British Art) or from Yorkshire. Towards the end of 1881 he went to the Riviera, returned in the spring, and died at Haslemere on the 10th of June 1882. Lawson may be said to have restored to English landscape the tradition of Gainsborough, Crome and Constable, infused with an imaginative native of his own. Among English landscape painters of the latter part of the 19th century his is in many respects the most interesting name.

See E. W. Gosse, Cecil Lawson, a Memoir (1883); Heseltine Owezow, "In Memoriam: Cecil Gordon Lawson," Magazine of Art (1894).

**LAWSON, SIR JOHN** (d. 1665). British sailor, was born at Scarborough. Joining the parliamentary navy in 1642, he accompanied Penn to the Mediterranean in 1659, where he served for some time. In 1652 he served under Blake in the Dutch War and was present at the first action in the Downs and the battle of the Kentish Knock. At Portland, early in 1653, he was vice-admiral of the red, and his ship was severely handled. Lawson took part in the battles of June and July in the following summer. In 1654-1655 he commanded in the North Sea and the Channel. Appointed in January 1655-1656 as Blake's second-in-command, Lawson was a few weeks later summarily dismissed from his command, probably for political reasons. He was a Republican and Anabaptist, and therefore an enemy to Cromwell. It is not improbable that like Penn and others he was detested in correspondence with the exiled Charles II. He certainly hoped for his support. In 1657, along with Harrison and others, he was arrested and, for a short time, imprisoned for conspiring against Cromwell. Afterwards he lived at Scarborough until the fall of Richard Cromwell's government. During the troubled months which succeeded that event, Lawson, flying his flag as admiral of the Channel fleet, played a marked political role. His ships escorted Charles to England, and he was soon afterwards knighted. Sent out in 1661 with Montagu, earl of Sandwich, to the Mediterranean, Lawson conducted a series of campaigns against the piratical states of the Algerian coast. Thence summoned to a command in the Dutch War, he was mortally wounded at Lowestoft. He died on the 29th of June 1665.

See Charnock, Biographia navalis, i. 20; Campbell, Lives of the Admirals, ii. 251; Penn, Life of Sir William Penn; Pepys, Diary.

**LAWSON, SIR WILFRID,** Bart. (1829-1900). English politician and temperance leader, son of the 1st baronet (d. 1867), was born on the 4th of September 1829. He was always an enthusiast in the cause of total abstinence, and in parliament, to which he was first elected in 1859 for Carlisle, he became its leading spokesman. In 1864 he first introduced his Permissive Bill, giving to a two-thirds majority in any district a veto upon the granting of licences for the sale of intoxicating liquors; and though this principle failed to be embodied in any act, he had the satisfaction of seeing a resolution on its lines accepted by a majority in the House of Commons in 1880, 1881 and 1883. He lost his seat for Carlisle in 1865, but in 1868 was again returned as a supporter of Mr Gladstone, and was member till 1885; though defeated for the new Cockermouth division of Cumberland in 1885, he won that seat in 1886, and he held it till the election of 1900, when his violent opposition to the Boer War caused his defeat, but in 1903 he was returned for the Camborne division of Cornwall and at the general election of 1906 was once more elected for his old constituency in Cumberland. During all these years he was the champion of the United Kingdom Alliance (founded 1853), of which he became president. An extreme Radical, he also supported disestablishment, abolition of the House of Lords, and disarmament. Though violent in the expression of his opinions, Sir Wilfrid Lawson remained very popular for his own sake both in and out of the House of Commons; he became well known for his humorous vein, his faculty for composing topical doggerel being often exercised on questions of the day. He died on the 1st of July 1906.

**LAYA, SIR J.**—Laya, a word of several meanings. Apart from obsolete and dialectical usages, such as the East Anglian word meaning "pond," possibly cognate with Lat. laxis, pool or lake, or its use in weaving for the batten of a loom, where it is a variant form of "lath," the chief uses are as follows: (1) A song or, more accurately, a short poem, lyrical or narrative, which could be sung or accompanied by music; such were the romances sung by minstrels. Such an expression as the "Lay of the Nibelungen" is due to mistaken association of the word with Ger. Lied, song, which appears in Anglo-Saxon as lēoht. "Lay" comes from O. Fr. lai, of which the derivation is doubtful. The New English Dictionary rejects Celtic origins sometimes put forward, such as Fr. laoith, Welsh lais, and takes O. Mid. and High Ger. leicht as the probable source. (2) "Non-clerical" or "unlearned." In this sense "lay" comes directly from Fr. lai (latique, the learned form nearer to the Latin, is now used) from Lat. latices, Gr. λαίκος, of or belonging to the people (λαός, Attic λαός). The word is now specially applied to persons who are not in orders, and more widely to those who do not belong to other learned professions, particularly the law and medicine. The New English Dictionary quotes two examples from versions of the Bible. In John xiv. 4, Ahimelech tells Daviethat he has "no lay brethren, but only holy bread"; here the Authorized Version has "common bread," the Vulgate laicos panes. In Coverdale's version of Acts iv. 13, the high priest and his kindred minister at Peter and John as being "unlearned and lay people," the Authorized Version has "unlearned and ignorant men." In a cathedral of the Church of England "lay clerks" and "lay vicars" sing such portions of the service as may be performed by laity and clergy in minor orders. "Lay readers" are persons who are granted a commission by the bishop to perform certain religious duties in a particular parish. The commission remains in force until it is revoked by the bishop or his successors, or till there is a new incumbent in the parish, when it has to be renewed. In a religious order a "lay brother" is freed from duties at religious services performed by the other members, and from their studies, but is bound by vows of obedience and chastity and serves the order by manual labour. For "lay impropriator" see APPROPRIATION, and for "lay rector" see Rector and COMMUNITY OF THE HOLY TRINITY. (3) As a noun, "lay" means "to make to lie down," "to place upon the ground," &c. The past tense is "layd"; it is vulgarly confused with the verb "to lie," of which the past is "lay." The common root of both "lie" and "lay" is represented by O. Teut. leg; cf. Dutch leggen, Ger. legen, and Eng. "ledge." (4) "Lay-figure" is the name commonly given to articulated figures of human beings or animals, made of wood, papier-mâché or other materials; draped and posed, such figures serve as models for artists (see MODELS, ARTISTS). The word has no connexion with "to lay," to place in position, but is an adaptation of the word "layman," commonly used with this meaning in the 18th century. This was adapted from Dutch leeman (the older form is ledenman) and meant an "artificial or jointed man" from led, now lid, a joint; cf. Ger. Gliedermann.

**LAYA, JEAN LOUIS** (1761-1833). French dramatist, was born in Paris on the 4th of December 1761 and died in August 1833. He wrote his first comedy in collaboration with Gabriel M. J. B. Legouvé in 1785, but the piece, though accepted by the Comédie Française, was never represented. In 1789 he produced a plea for religious toleration in the form of a five-act tragedy in verse, Jean Calas; the injustice of the disgrace cast on a family by the crime of one of its members formed the theme of Les Dangers de l'opinion (1790); but it is by his Ami des lois (1793) that Laya is remembered. This energetic protest against mob-rule, with its scarcely veiled characterizations of Robespierre as Nomophage and of Marat as Dürerzand, was an act of the highest courage, for the play was produced at the Théâtre Français (temporarily Théâtre de la Nation) only

1 The verb "to lie," to speak falsely, to tell a falsehood, is in O. Eng. liegen; it appears in most Teutonic languages, e.g. Dutch legen, Ger. liegen.
nineteen days before the execution of Louis XVI. Ten days after its first production the piece was prohibited by the commune, but the public demanded its representation; the mayor of Paris was compelled to appeal to the convention, and the piece was played while some 30,000 Parisians guarded the hall. Laya went into hiding, and several persons convicted of having a copy of the obnoxious play in their possession were guillotined. At the end of the Terror Laya returned to Paris. In 1813 he replaced Delille in the Paris chair of literary history and French poetry; he was admitted to the Academy in 1817. Laya produced in 1797 Les Deux Stuart, and in 1799 Falkirk, the title-role of which provided Talma with one of his finest opportunities. Laya's works, which chiefly owe their interest to the circumstances attending their production, were collected in 1836-1837.

See Notice biographique sur J. L. Laya (1833); Ch. Nodier, Discours de Léopold; 26th December 1835; Weltschinger, Théâtre de la révolution (1880).

LAYAMON, early English poet, was the author of a chronicle of Britain entitled Brut, a paraphrase of the Brut d'Anglettere by Wace, a native of Jersey, who is also known as the author of the Roman de Rou. The excellent edition of Layamon by Sir F. Madden (Society of Antiquaries, London, 1847) should be consulted. All that is known concerning Layamon is derived from two extant MSS., which present texts that often vary considerably, and it is necessary to understand their comparative value before any conclusions can be drawn. The older text (here called the A-text) lies very near the original text, which is unfortunately lost, though it now and then omits lines which are absolutely necessary to the sense. The later text (here called the B-text) represents a later recension of the original version by another writer who frequently omits couplets, and alters the language by the substitution of better-known words for such as seemed to be obsolete; e.g. *barne* (harm) in place of *bale* (bale), and *dead* in place of *feie* (fate to die, or dead). Hence little reliance can be placed on the B-text, its chief merit being that it sometimes preserves couplets which seem to have been accidentally omitted in A; besides which, it affords a valuable commentary on the original version.

We learn from the brief preface that Layamon was a priest among the people, and was the son of Leovarnath (a late spelling of A.-S. Leofnoth); also, that he lived at Ernley, at a noble church on Severn bank, close by Radstone. This is certainly Areley Regis, or Areley Kings, close by Redstone rock and ferry, r. m. to the S. of Stourport in Worcestershire. The B-text turns Layamon into the later form Lawman, i.e. Lawman, correctly answering to Chaucer’s “Man of Lawe,” though here apparently used as a mere name. It also turns Leovarnath into Leuca, i.e. Leofeca, a diminutive of Leofa, which is itself a patronymic for Leophth; so that there is no real contradiction. But it absurdly substitutes “with the good knight,” which is practically meaningless, for “at a noble church.”

We know no more about Layamon except that he was a great lover of books; and that he procured three books in particular which he prized above others, “turning over the leaves, and beholding them lovingly.” These were: the English book that St Beda made; another in Latin that St Albin and St Austin made; whilst the third was made by a French clerk named Wace, who (in 1153) gave a copy to the noble Eleanor, who was queen of the high king Henry (i.e. Henry II.).

The first of these really means the Anglo-Saxon translation of Beda’s *Bedeisastical History*, which begins with the words: “In Beda, Crises theor,” i.e. “In Beda, Christ’s storyteller.” The second is a translation of the original of the translation, i.e. Albinus a Beda’s own Latin book, the second paragraph of which begins with the words: “Auctor ante omnes atque adiutor opusculi hujus Albinus Aba reverensissimus vir omnia doctissimius excitit”; which Layamon evidently misunderstood. As to the share of St Augustine in this work, see Book I., chapters 23-24, and Book II., chapters 1 and 2, which are practically all concerned with him and occupy more than a tenth of the whole work. The third book was Wace’s poem, *Brut d’Anglettere*. But we find that although Layamon had ready access to all three of these works, he soon settled down to the translation of the third, without troubling much about the others. His chief obligation to Beda is for the well-known story about Pope Gregory and the English captives at Rome; see Layamon, vol. iii. 180.

It is impossible to enter here upon a discussion of the numerous points of interest which a proper examination of this vast and important work would present to any careful inquirer. Only a few bare results can be here enumerated. The A-text may be dated about 1205, and the B-text (practically by another writer) about 1275. Both texts, the former especially, are remarkably free from admixture with words of French origin; the lists that have been given hitherto are inexact, but it may be said that the number of French words in the A-text can hardly exceed 100, or in the B-text 160. Layamon’s work is largely based on Wace’s; Wace’s text consists of 23,210 lines, while Layamon’s 32,240 lines of a similar length; and many of Layamon’s additions to Wace are not able, such as his story “regarding the fairy elves at Arthur’s birth, and his transportation by them after death in a boat to Avalon, the abode of Argante, their queen”; see Sir F. Madden’s pref. p. xv. Wace’s *Brut* is almost wholly a translation of the Latin chronicle concerning the early history of Britain by Geoffrey of Monmouth, who said that he obtained his materials from a manuscript written in Welsh. The name Brut is the French form of Brutus, who was the fabulous grand-son of Ascanius, and great-grandson of Aeneas of Troy, the hero of Virgil’s *Aeneid*. After many adventures, this Brutus arrived in England, founded Troyeovant or New Troy (better known as London), and was the progenitor of a long line of British kings, among whom were Locrine, Bladud, Leir, Gorboldoc, Perrex and Porrex, Lud, Cymbeline, Constantine, Vortigern, Uther and Arthur; and this mythical Brutus was afterwards the name of the Brut in whose time Wace was guillotined. So as to denote the entire chronicle of this British history. Layamon gives the whole story, from the time of Brutus to that of Cadwalader, who may be identified with the Cadwalla of the Anglo-Saxon Chronicle, baptized by Pope Sergius in the year 688. Both texts of Layamon are in a south-western dialect; the A-text in particular shows the Wessex dialect of earlier times (commonly called Anglo-Saxon) in a much later form, and we can hardly doubt that the author, as he intimates, could read the old version of Beda intelligently. The remarks upon the B-text in Sir F. Madden’s preface are not to the point; the peculiar spellings to which he refers (such as *somer* for *shame*) are by no means due to any confusion with the Northumbrian dialect, but rather to the usual vagaries of a scribe who knew French better than English, and had some difficulty in acquiring the English pronunciation and in representing it accurately. At the same time, he was not strong in English grammar, and was apt to confuse the plural form with the singular in the tenses of verbs; and this is the simple explanation of most of the examples of so-called “nunnation” in this poem (such as the use of *woden* for *wolde*), which only existed in writing and must not be seriously considered as representing real spoken sounds. The full proof of this would occupy too much space; but it should be noticed that in many instances, “this pleonastic *n* has been struck out or erased by a second hand.” In other instances it has escaped notice, and that is all that need be said. The peculiar metre of the poem has been sufficiently treated by J. Schipper. An abstract of the poem has been given by Henry Morley; and good general criticisms of it by B. ten Brink and others.

LAYARD—LAZAR

LAYARD, SIR AUSTEN HENRY (1817-1894). British author and diplomatist, the excavator of Nineveh, was born in Paris on the 18th of March 1817. The Layards were of Huguenot descent. His father, Henry P. J. Layard, of the Ceylon Civil Service, was the son of Charles Peter Layard, dean of Bristol, and grandson of Daniel Peter Layard, the physician. Through his mother, a daughter of Nathaniel Austen, banker, of Ramsgate, he inherited Spanish blood. This strain of cosmopolitanism must have been greatly strengthened by the circumstances of his education. Much of his boyhood was spent in Italy, where he received part of his schooling, and acquired a taste for the fine arts and a love of travel; but he was at school also in England, France and Switzerland. After spending nearly six years in the office of his uncle, Benjamin Austen, a solicitor, he was tempted to leave England for Ceylon by the prospect of obtaining an appointment in the civil service, and he started in 1839 with the intention of making an overland journey across Asia. After wandering for many months, chiefly in Persia, and having abandoned his intention of proceeding to Ceylon, he returned in 1842 to Constantinople, where he made the acquaintance of Sir Stratford Canning, the British ambassador, who employed him in various unofficial diplomatic missions in European Turkey. In 1845, encouraged and assisted by Canning, Layard left Constantinople to make those explorations among the ruins of Assyria with which his name is chiefly associated. This expedition was in fulfilment of a design which he had formed, when, during his former travels in the East, his curiosity had been greatly excited by the ruins of Nimrud on the Tigris, and by the great mound of Kuyunjik, near Mosul, already partially excavated by Botta. Layard remained in the neighbourhood of Mosul, carrying on excavations at Kuyunjik and Nimrud, and investigating the condition of various tribes, until 1847; and, returning to England in 1848, published Nineveh and Its Remains: with an Account of a Visit to the Chaldean Christians of Kurdistan, Susiana, Susa, Babylon, Nineveh, the Assyrians, or Devil-worshippers; and an Inquiry into the Manners and Arts of the Ancient Assyrians (2 vols., 1848-1849). To illustrate the antiquities described in this work he published a large folio volume of Illustrations of the Monuments of Nineveh (1849). After spending a few months in England, and receiving the degree of D.C.L. from the university of Oxford, Layard returned to Constantinople as attaché to the British embassy, and, in August 1849, started on a second expedition, in the course of which he extended his investigations to the ruins of Babylon and the mounds of southern Mesopotamia. His record of this expedition, Discoveries in the Ruins of Nineveh and Babylon, which was illustrated by another folio volume, called A Second Series of the Monuments of Nineveh, was published in 1853. During these expeditions, often in circumstances of great difficulty, Layard despatched to England the splendid specimens which now form the greater part of the collection of Assyrian antiquities in the British Museum. Apart from the archaeological value of his work in identifying Kuyunjik as the site of Nineveh, and in providing a great mass of materials for scholars to work upon, these two books of Layard's are among the best-written books of travel in the language.

Layard now turned to politics. Elected as a Liberal member for Aylesbury in 1852, he was for a few weeks under-secretary for foreign affairs, but afterwards freely criticized the government, especially in connexion with army administration. He was present in the Crimea during the war, and was a member of the committee appointed to inquire into the conduct of the expedition. In 1855 he refused from Lord Palmerston an office not connected with foreign affairs, was elected lord rector of Aberdeen university, and on 15th June moved a resolution in the House of Commons (defeated by a large majority) declaring that in public appointments merit had been sacrificed to private influence and caprice; and to routine. After being defeated at Aylesbury in 1857, he visited India to investigate the causes of the Mutiny. He unsuccessfully contested York in 1859, but was elected for Southwark in 1860, and from 1861 to 1866 was under-secretary for foreign affairs in the successive administrations of Lord Palmerston and Lord John Russell. In 1866 he was appointed a trustee of the British Museum, and in 1868 chief commissioner of works in W. E. Gladstone's government and a member of the Privy Council. He retired from parliament in 1869, on being sent as envoy extraordinary to Madrid. In 1877 he was appointed by Lord Beaconsfield ambassador at Constantinople, where he remained until Gladstone's return to power in 1880, when he finally retired from public life. In 1878, on the occasion of the Berlin conference, he received the grand cross of the Bath. Layard's political life was somewhat stormy. His manner was brusque, and his advocacy of the causes which he had at heart, though always perfectly sincere, was vehement to the point sometimes of recklessness. Layard retired to Venice, where he devoted much of his time to collecting pictures of the Venetian school, and to writing on Italian art. On this subject he was a disciple of his friend G. Morelli, whose views he embodied in his revision of F. Kugler's Handbook of Painting, Italian Schools (1887). He wrote also an introduction to Miss Foulkes's translation of Morelli's Italian Painters (1892-1893), and edited that part of Murray's Handbook of Rome (1894) which deals with pictures. In 1887 he published, from notes taken at the time, a record of his first journey to the East, entitled Early Adventures in Persia, Susiana and Babylonia. An abbreviation of this work, which as a book of travel is even more delightful than its predecessors, was published in 1894, shortly after the author's death, with a brief introductory notice by Lord Abergare. Layard also from time to time contributed papers to various learned societies, including the Huguenot Society, of which he was first president. He died in London on the 5th of July 1894.

LAYMEN, HOUSES OF, deliberative assemblies of the laity of the Church of England, one for the province of Canterbury, and the other for the province of York. That of Canterbury was formed in 1866, and that of York shortly afterwards. They are merely consultative bodies, and the primary intention of their foundation was to associate the laity in the deliberations of convocation. They have no legal status. The members are elected by the various diocesan conferences, which are in turn elected by the laity of their respective parishes or rural deaneries. Ten members are appointed for the diocese of London, six for each of the dioceses of Winchester, Rochester, Lichfield and Worcester; and four for each of the remaining dioceses. The president of each house has the discretionary power of appointing additional laymen, not exceeding ten in number.

LAYNEZ (or LAINZE), DIEGO (1512-1565), the second general of the Society of Jesus, was born in Castile, and after studying at Alcalá joined Ignatius of Loyola in Paris, being one of the six who with Loyola in August 1534 took the vow of missionary work in Palestine in the Montmartre church. This plan fell through, and Laynez became professor of scholastic theology at Santiago. After the order had been definitely established (1540) Laynez was sent to Germany. He was one of the pope's theologians at the council of Trent (q.v.), where he played a weighty and decisive part. When Loyola died in 1556 Laynez acted as vicar of the society, and two years later became general. Before his death at Rome, on the 10th of January 1565, he had immensely strengthened the despotic constitution of the order and developed its educational activities (see JESUITS).

His Disputationes Tridentinae were published in 2 volumes in 1586. Lives by Michel d'Esse (Douai, 1597) and Pet. Ribadeo (1580); Lat. trans. by A. Schott, Antwerp, 1598. See also H. Müller, Les Origines de la Compagnie de Jésus: Ignace et Laines (1898).

LAZAR, one afflicted with the disease of leprosy (q.v.). The term is an adaptation in medieval Latin of the name of Lazarus (q.v.), in Luke xvi. 20, who was supposed to be a leper. The word was not confined to persons suffering from leprosy; thus Caxton (The Life of Charles the Great, 37), "there were sick... in houses of wardens... who are as lepers.

LAZARETTI or LAZARET-HOUSES is a hospital for the reception of poor persons suffering from the plague, leprosy or other infectious or contagious diseases. A peculiar use of "lazaretto" is found in the application of the term, now obsolete, to a place in the after-part of a merchant vessel for the storage of provisions, &c.
Lazarites—Lazarus, H.

Lazarisone, a name now often applied generally to beggars, is an Italian term, particularly used of the poorest class of Neapolitans, who, without any fixed abode, live by odd jobs and fishing, but chiefly by begging.

Lazarites (Lazaristis or Lazararians), the popular names of the "Congregation of Priests of the Mission" in the Roman Catholic Church. It had its origin in the successful mission to the common people conducted by St Vincent de Paul (q.v.) and five other priests on the estates of the Gondi family. More immediately it dates from 1624, when the little community acquired a permanent settlement in the collège des Bons Enfans in Paris. Archdiocesan recognition was obtained in 1626; by a papal bull of the 12th of January 1632, the society was constituted a congregation, with St Vincent de Paul at its head. About the same time the canons regular of St Victor handed over to the congregation the priory of St Lazarus (formerly a lazaar-house) in Paris, whence the name of Lazarites or Lazarists.

Within a few years they had acquired another house in Paris and set up other establishments throughout France, which were also sent to Italy (1638), Tunis (1643), Algiers and Ireland (1646), Madagascar (1648) and Poland (1651). A fresh bull of Alexander VII. in April 1655 further confirmed the society; this was followed by a brief in September of the same year, regulating its constitution. The rules then adopted, which were framed on the model of those of the Jesuits, were published at Paris in 1668 under the title Regulae seu constitutiones communis congregatio missionis. The special objects contemplated were the religious instruction of the lower classes, the training of the clergy and foreign missions. During the French Revolution the congregation was suppressed and St Lazare plundered by the mob; it was restored by Napoleon in 1804 at the desire of Pius VII., abolished by him in 1806 in consequence of a quarrel with the pope, and again restored in 1816. The Lazarites were expelled from Italy in 1871 and from Germany in 1873. The Lazarist province of Poland was singularly prosperous at the date of its suppression in 1766; it possessed thirty-five establishments. The order was permitted to return in 1816, but is now extinct there. In Madagascar it had a mission from 1648 till 1764. In 1781 Lazarites were appointed to take the place of the Jesuits in the Levantine and Chinese missions; they still have some footing in China, and in 1874 their establishments throughout the Turkish empire numbered sixteen. In addition, they established branches in Persia, Abyssinia, Mexico, the South American republics, Portugal, Spain and Russia, some of which have been suppressed. In the same year they had fourteen establishments in the United States of America. The total number of Lazarites throughout the world is computed at about 3000. Amongst distinguished members of the congregation may be mentioned: P. Collet (1663-1770), writer on theology and ethics; J. de la Grive (1680-1757), geographer; E. Boré (d. 1878), orientalist; P. Berthan (1680-1755), physician; and Armand David, Chinese missionary and traveller.

Lazarus (a contracted form of the Heb. name Eleazar, "God has helped," Gr. Ἐλαζαρος, a name which occurs in the New Testament in two connections.

1. Lazarus of Bethany, brother of Martha and Mary. The story that he died and after four days was raised from the dead is told by John (xi., xii.) only, and is not mentioned by the Synoptists. By many this is regarded as the greatest of Christ's miracles. It produced a great effect upon many Jews; the Acta Pilati says that Pilate trembled when he heard of it, and, according to Bayle's Dictionary, Spinoza declared that if he were persuaded of its truth he would become a Christian. The story has been attacked more vigorously than any other portion of the Fourth Gospel, mainly on two grounds, (i) the fact that, in spite of its striking character, it is omitted by the Synoptists, and (ii) its unique significance. The personality of Lazarus in John's account, his relation to Martha and Mary, and the possibility that John reconstructed the story by the aid of inferences from the story of the supper in Luke x. 40, and that of the anointing of Christ in Bethany given by Mark and Matthew, are among the chief problems. The controversy has given rise to a great mass of literature, discussions of which will be found in the lives of Christ, the biblical encyclopaedias and the commentaries on St John.

2. Lazarus is also the name given by Luke (xvi. 20) to the beggar in the parable known as that of "Lazarus and Dives," illustrating the misuse of wealth. There is little doubt that the name is introduced simply as part of the parable, and not with any idea of identifying the beggar with Lazarus of Bethany. It is curious, not only that Luke's story does not appear in the other gospels, but also that in no other of Christ's parables is a name given to the central character. Hence it was in early times thought that the story was historical, not allegorical (see Lazar).

Lazarus, Emma (1840-1887), American Jewish poetess, was born in New York. When the Civil War broke out she was soon inspired to lyric expression. Her first book (1867) included poems and translations which she wrote between the ages of fourteen and seventeen. As yet her models were classic and romantic. At the age of twenty-one she published Admetus and other Poems (1871). Admetus is inscribed to Emerson, who greatly influenced her, and with whom she maintained a regular correspondence for several years. She led a retired life, and had a modest conception of her own powers. Much of her next work appeared in Lippincott's Magazine, but in 1874 she published a prose romance (Ailde) based on Goethe's autobiography, and received a generous letter of admiration from Turgenev. Two years later she visited Concord and made the acquaintance of the Emerson circle, and while there read the proof-sheets of her tragedy The Syagrius. In 1881 she published her own English translations of Heine's poems. Meanwhile events were occurring which appealed to her Jewish sympathies and gave a new turn to her feeling. The Russian massacres of 1880-1881 were a trumpet-call to her. So far her Judaism had been latent. She belonged to the oldest Jewish congregation of New York, but she had not for some years taken a personal part in the observances of the synagogue. But from this time she took up the cause of her race, and "her verse rang out as it had never rung before, a clarion note, calling a people to heroic action and unity; to the consciousness and fulfilment of a grand destiny." Her poems, "The Crowning of the Red Cock" and "The Banner of the Jew" (1882) stirred the Jewish consciousness and helped to produce the new Zionism (q.v.). She now wrote another drama, the Dance to Death, the scene of which is laid in Nordhausen in the 14th century; it is based on the accusation brought against the Jews of poisoning the wells and thus causing the Black Death. The Dance to Death was included (with some translations of medieval Hebrew poems) in Songs of a Semite (1882), which she dedicated to George Eliot. In 1885 she visited Europe. She devoted much of the short remainder of her life to the cause of Jewish nationalism. In 1887 appeared By the waters of Babylon, which consists of a series of "prose poems," full of prophetic fire. She died in New York on the 9th of November 1887. A sonnet by Emma Lazarus is engraved on a memorial tablet on the colossal Bartholdi statue of Liberty, New York.

See article in the Century Magazine, New Series, xiv. 575 (portrait p. 573); afterwards published as a Memoir to the collected edition of The poems of Emma Lazarus (2 vols., 1889).

(L. A.)

Lazarus, Henry (1815-1805), British clarinettist, was born in London on the 1st of January 1815, and was a pupil of Blizard, bandmaster of the Royal Military Asylum, Chelsea, and subsequently of Charles Godfrey, senior, bandmaster of the Coldstream Guards. He made his first appearance as a soloist at a concert of Mme Dulcken's, in April 1838, and in that year

1 The English Bible does not use Lat. Dives (rich) as a proper name, saying merely, "a certain rich man." The idea that Dives was a proper name arose from the Vulgate quidam dives, whence it became a conventional name for a rich man.
he was appointed as second clarinet to the Sacred Harmonic Society. From William's death in 1840 Lazarus was principal clarinet at the opera, and all the chief festivals and orchestral concerts. His beautiful tone, excellent phrasing and accurate execution were greatly admired. He was professor of the clarinet at the Royal Academy of Music from 1854 until within a short time of his death, and was appointed to teach his instrument at the Military School of Music, Kneller Hall, in 1858. His last public appearance was at a concert for his benefit in St James's Hall, in June 1892, and he died on the 6th of March 1893.

LAZARUS, MORITZ (1824-1903), German philosopher, was born on the 15th of September 1824 at Filehne, Posen. The son of a rabbinical scholar, he was educated in Hebrew literature and history, and subsequently in law and philosophy at the university of Berlin. From 1850 to 1866 he was professor in the university of Berne, and subsequently returned to Berlin as professor of philosophy in the kriegsakademie (1868) and later in the university of Berlin (1873). On the occasion of his seventieth birthday he was honored with the title of Geheimrat. The fundamental principle of his philosophy was that truth must be sought not in metaphysical or a priori abstractions but in psychological investigation, and further that this investigation cannot confine itself successfully to the individual consciousness, but must be devoted primarily to society as a whole. The psychologist must study mankind from the historical or comparative standpoint, analysing the elements which constitute the fabric of society, with its customs, its conventions and the main tendencies of its evolution. Diese Philosophie (folk-or comparative psychology) is one of the chief developments of the Herbartian theory of philosophy; it is a protest not only against the so-called scientific standpoint of natural philosophers, but also against the individualism of the positivists. In support of his theory he founded, in combination with H. Steinthal, the Zeitschrift für Völkerpsychologie und Volkskunde (1893). His own contributions to this periodical were numerous and important. His chief work was Das Leben der Sache (Berlin, 1855-1857; 3rd edition, 1863). Other philosophical works were—Über die Ursprung der Sitten (1865); Ueber die Ideen in der Geschichte (1865 and 1872); Zur Lehre von den Sinnerleuchtungen (1867); Ideale Fragen (1875 and 1885), Erziehung und Geschichte (1881); Unser Standpunkt (1891); Ueber die Reise des Spiels (1895). Apart from the great interest of his philosophical work, Lazarus was pre-eminent among the Jews of the so-called Semitic domination in Germany. Like Heine, Auerbach and Steinthal, he rose superior to the narrower ideals of the German Jews, and took a leading place in German literature and thought. He protested against the violent anti-Semitism of the time, and, in spite of the moderate tone of his publications, drew upon himself unqualified censure. He wrote in this connexion a number of articles collected in 1887 under the title Treu und Frei. Reden und Vorträge über Juden u. J Juden (Berlin, 1869 and 1871) he was president of the first and second Jewish Synods at Leipzig and Augsburg. Schriften und Briefe zu Geschichtsthemen: 3 voll. Von der Hochzeit Christi, am Assis diesem Jahre, die Bräuche der Survage, der Tracht und Waffe, der feste sowohl als die Gesammtwerke der Philosophie, und Literatur: E. Berliner, Lazarus und die öffentliche Meinung; M. Brusch, Der Begründer der Völkerpsychologie, in Nord et Sud (September 1893).

LAZARUS, ST. ORDER OF, a religious and military order founded in Jerusalem about the middle of the 12th century. Its primary object was the tending of the sick, especially lepers, of whom Lazarus (see Lazar) was regarded as the patron. From the 13th century, the order made its way into various countries of Europe—Sicily, Lower Italy and Germany (Thuringia); but its chief centre of activity was France, where Louis IX. (1253) gave the members the lands of Boigny near Orleans and a building at the gates of Paris, which they turned into a lazar-house for the use of the lepers of the city. A papal confirmation was obtained from Alexander IV. in 1255. The knights were one hundred in number, and possessed the right of marrying and receiving pensions charged on ecclesiastical benefices. An eight-pointed cross was the insignia of both the French and Italian orders. The gradual disappearance of leprosy combined with other causes to secularize the order more and more. In Savoy it was secularized by Gregory XIII. (at the instance of Emanuel Philibert, duke of Savoy) in the order of St. Maurice (see Knighthood and Chivalry: Orders of Knighthood, Italy). The chief task of this branch was the defence of the Catholic faith, especially against the Protestantism of Geneva. It continued to exist till the second half of the 19th century. In 1608 it was in France united by Henry IV. with the order of Notre-Dame du Mont-Carmel. It was treated with special favour by Louis XIV., and the most brilliant period of its existence was from 1673 to 1691, under the marquis de Louvois. From that time it began to decay. It was abolished at the Revolution, reintroduced during the Restoration, and formally abolished by a state decree of 1830.

LEA, HENRY CHARLES (1825-1900), American historian, was born at Philadelphia on the 19th of September 1825. His father was a publisher, whom in 1843 he joined in business, and he retained his connexion with the firm till 1880. Weak health, however, caused him from early days to devote himself to research, mainly on church history in the later middle ages, and his literary reputation rests on the important books he produced on this subject. These are: Superstition and Force (Philadelphia, 1866, new ed. 1892); Historical Sketch of Sacerdotal Celibacy (Philadelphia, 1867); History of the Inquisition of the Middle Ages (New York, 1888); Chapters from the religious history of Spain connected with the Inquisition (Philadelphia, 1890); History of curricular Confession and Indulgences in the Latin Church (3 vols., London, 1896); Hetoriscos of Spain (Philadelphia, 1901), and History of the Inquisition of Spain (4 vols., New York and London, 1906-1907). He also edited a Formulary of the Papal Penitentiary in the 13th century (Philadelphia, 1892), and in 1908 published his Inquisition in the Spanish Dominions. As an authority on the Inquisition he stood in the highest rank of modern historians, and distinctions were conferred on him by the universities of Harvard, Princeton, Pennsylvania, Giessen and Moscow. He died at Philadelphia on the 24th of October 1909.

LEAD (pronounced Iead), a city of Lawrence county, South Dakota, U.S.A., situated in the Black Hills, at an altitude of about 5300 ft., 3m. S.W. of Deadwood. Pop. (1890) 2951, (1900) 6120, of whom 2145 were foreign-born, (1905) 8217, (1910) 8392. In 1905 it was second in population among the cities of the state. It is served by the Chicago, Burlington & Quincy, the Chicago & North-Western, and the Chicago, Milwaukee & St Paul railways. Lead has a hospital, the Hearst Free Library and the Hearst Free Kindergarten, and is the see of a Roman Catholic bishopric. It is the centre of the mining interests of the Black Hills, and the Homestake Gold Mine here contains perhaps the largest and most easily worked mass of low-grade ore and one of the largest mining plant (comprising pay-zones) in the world; it was estimated in 1873 as worth $80,000,000. From 1878 to 1906 the value of the gold taken from this mine amounted to about $8,200,000, and the net value of the product of 1906 alone was approximately $5,313,516. For two months in the spring of 1907 the mine was rendered idle by a fire (March 23), which was so severe that it was necessary to flood the entire mine. Mining tools and gold jewelry are manufactured. The first settlement was made here by mining prospectors in July 1876. Lead was chartered as a city in 1890 and became a city of the first class in 1904.

LEAD, a metallic chemical element; its symbol is Pb (from the Lat. plumbum), and atomic weight 207-10 (o = 16). This metal was known to the ancients, and is mentioned in the Old Testament. The Romans used it largely, as it is still used, for the making of water pipes, and soldered these with an alloy of lead and tin. Pliny treats of these two metals as plumbum nigrum and plumbum album respectively, which seems to show
that at his time they were looked upon as being only two varieties of the same species. In regard to the ancients' knowledge of lead, we may state that the substance described by Dioscorides as κρόκωτος was undoubtedly litharge, that Pliny uses the word minium in its present sense of red lead, and that white lead was well known to Gerber in the 8th century. The alchemists designated it by the sign of Saturn $\mathbb{R}$.

Occurrence.—Metallic lead occurs in nature but very rarely and then only in minute amount. The chief lead ores are galena and cerussite; of minor importance are anglesite, pyromorphite and mimetesite (qq.v.). Galena (q.v.), the principal lead ore, has a world-wide distribution, and is always contaminated with silver sulphide, the proportion of noble metal varying from about 0-01 or less to 0-3%, and in rare cases coming up to $\frac{1}{2}$ or 1%. Fine-grained galena is usually richer in silver than the coarse-grained. Galena occurs in veins in the Cambrian clay-slate, accompanied by copper and iron pyrites, zinc-blende, calcite, pyrite, and; also in beds or nests within sandstones and rudimentary limestones, and in a great many other geological formations. It is pretty widely diffused throughout the earth's crust. The principal English lead mines are in Derbyshire; but there are others in several parts of England, and in the Isle of Man. There are also considerable workings in other parts of western Northumberland, at Alston Moor and other parts of Cumberland, in the western parts of Durham, in Swaledale and Arkendale and other parts of Yorkshire, in Salop, in Cornwall, in the Mendip Hills in Somersetshire, and in the Isle of Man. The Welsh mines are chiefly in Flint, Cardigan and Montgomeryshire; the Scottish in Dumfries, Lanark and Argyll; and the Irish in Wicklow, Waterford and Down. Of continental mines we may mention those in Saxony and in the Harz, Germany; those of Carinthia, Austria; and especially those of the southern provinces of Spain. It is widely distributed in the United States, and occurs in Mexico and Brazil; it is found in Tunisia and Algeria, in the Altai Mountains and India, and in New South Wales, Queensland, and in Tasmania.

The native carbonate or cerussite (q.v.) occasionally occurs in the pure form, but more frequently in a state of intimate mixture with clay ("lead earth," Blende), limestone, iron oxides, &c. (as in the ores of Nebraska and Colorado), and some times also with coal ("black lead of Ohio"). All native carbonate of lead seems to be due to the decomposition of nigritis, which is always present in it as an admixture. This ore, metallurgically, was not reckoned of much value, until immense quantities of it were discovered in Nevada and in Colorado (U.S.). The Nevada mines are mostly grouped around the city of Eureka, where the ore occurs in "pockets" disseminated at random through limestone. The crude ore contains about 30% lead and 0-2 to 0-3% silver. The Colorado lead district is in the Rocky Mountains, a few miles from the source of the Arkansas river. It forms gigantic deposits of almost constant thickness, embedded between a floor of limestone and a roof of porphyry. Stephens's discovery of the ore in 1877 was the making of the city of Leadville, which, in 1878, within a year of its founding, had over 10,000 inhabitants. The Leadville ore contains from 24 to 42% lead and 0-1 to 0-2% silver. In Nevada and Colorado the ore is worked chiefly for the sake of the silver. Deposits are also worked at Broken Hill, New South Wales.

Anglesite, or lead sulphate, PbSO₄, is poor in silver, and is only exceptionally mined by itself; it occurs in quantity in France, Spain, Switzerland and Austria. Of other lead minerals we may mention the basic sulphate lanarkite, PbO·PbSO₄; leadhillite, PbSO₄·3PbCO₃; the basic chlorides matlockite, PbO·PbCl₂, and mendipite, PbCl₂·2PbO; the chloro-phosphate pyromorphite, PbCl₂·3Pb(OPO₄)₂, the chloro-aragonite mimitesite, PbCl₂·3Pb(OH)(AsO₄)₂; the molybdate wulfenite, PbMoO₄·2Pb; the chromate crocoite or crocoisite, PbCrO₄; the tungstate stolzite, PbWO₄.

Production.—At the beginning of the 19th century the bulk of the world's supply of lead was obtained from England and Spain, the former contributing about 17,000 tons and the latter 10,000 tons annually. Germany, Austria, Hungary, France, Russia and the United States began to rank as producers during the second and third decades; Belgium entered in about 1840; Italy in the 'sixties; Mexico, Canada, Japan and Greece in the 'eighties; while Australia assumed importance in 1888 with a production of about 18,000 tons, although it had contributed small and varying amounts for many preceding decades. In 1850 England headed the list of producers with 39,000 tons, followed by Russia with 31,000 tons. Since this date, it has, on the whole, diminished, although large outputs occurred in isolated years, for instance, a production of 40,000 tons in 1893 was followed by 60,000 tons in 1896 and 80,000 tons in 1900. Russia has produced 1905, 25,000 tons. Spain ranked second in 1850 with about 47,000 tons; this increased to 1863, 1876 and in 1888 to 8,400, 127,000 and 187 tons respectively; but the maximum outputs mentioned were never exceeded. In 1830 the annual production was 176,000 tons, and in 1905, 179,000 tons. The United States, which ranked third with a production of 20,000 tons in 1850, maintained this annual yield, until 1870, when it began to increase; the United States now ranks as the chief producer; in 1893 the output was 253,000. In Canada in 1905, 51,000 tons were produced. Germany has likewise made headway; an output of 12,000 tons in 1850 being increased to 120,000 tons in 1905 and to 152,500 in 1903. This country now ranks third, having passed England in 1873. Italy has been a fairly steady producer; the output in 1896 was 20,000 tons and in 1905, 25,000 tons.

Metallurgy.

The extraction of the metal from pure (or nearly pure) galena is the simplest of all metallurgical operations. The ore is roasted (i.e. heated in the presence of atmospheric oxygen) until all the sulphur is burned away and the lead left. This simple statement, however, correctly formulates only the final result. The first effect of the roasting is the elimination of sulphur as sulphur dioxide, with formation of oxide and sulphate of lead. In practice this oxidation process is continued until the whole of the oxy sulphur is as nearly as possible equal in weight to the sulphur present as sulphide or as sulphate, i.e. in the ratio S : O. The heat is then raised (in relative) absence of air, when the two elements named unite into sulphur dioxide, while a regulus of molten lead remains. Lead ores are smelted in the reverberatory furnace, the ore-hearth, and the blast-furnace. The use of the first two is restricted, as they are suited only for galena ores or mixtures of galena and carbonate, which contain not less than 5% lead and not more than 4% silica; further, ores to be treated in the ore-hearth should run low in or be free from silver, while the loss in the furnaces is excessive. In the blast-furnace all lead ores are successfully smelted. Blast-furnace treatment has therefore become more general than any other.

Three types of reverberatory practice are in vogue—the English, Carinthian and Silesian. In Wallach and the south of England the process is conducted in a reverberatory furnace, the sole of which is paved with slags from previous operations, and has a depression in the middle where the metal formed collects to be leff off by a nap-hole. This is simple, unclear, and of small capacity. A better furnace is the direct reverberatory hearth, in which a certain proportion of ore is oxidized, openings at the side enabling the workmen to stir up the ore so as to constantly renew the surface exposed to the air. As the ore is raised, the slag falls out of the furnace. An addition of a small amount of coke, and a quantity of quicklime, is incorporated, the chief object of which is to diminish the fluidity of the mass in the next stage, which consists in this, that, with closed air-holes, the heat is raised so as to use the oxide and sulphate on retarding, and the sulphide on the other to reduce each other to metal. The lead produced runs into the hollow and is tapped off. The roasting process is then resumed, to be followed by another reduction, and so on.

A similar process is used in Carinthia; only the furnaces are smaller and of a somewhat different form. They are long and narrow; the sole is plane, but sloped from the fire-bridge towards the flue, so that the metal runs to the latter end to collect in pots placed on it. In Carinthia the ore of the Carinthia are smelted. In the first is pushed on so far that metallic lead begins to show, and the oxygen introduced predominates over the sulphur left. The mass is then stirred to liberate the lead, which is removed as Rählerit. Charcoal is now added, and the heat urged on to obtain Preschitz, an inferior metal formed partly by the action of the charcoal on the oxide of lead. The fuel used is fir-wood.
The Silesian furnace has an oblong hearth sloping from the firebridge to the flue-brick. This causes the lead to collect at the coolest part of the hearth, whence it is tapped, &c., as in the English furnace. While by the English and Carinthian processes as much lead as possible is extracted in the furnace, with the Silesian method, a very low temperature is used, thus taking out about one-half of the lead and leaving very rich slags (50% lead) to be smelted in the blast-furnace, the ultimate result being a much higher yield than with the other processes. Thus, the combined reverberatory and blast-furnace treatment is only 3-3%.

In Cumberland, Northumberland, Durham and latterly the United States, the reverberatory furnace is used only for roasting the ore, and the oxidized ore is then reduced by fusion in a low, square hearth furnace (a "Scottish hearth furnace") lined with cast iron, as is also the inclined sole-plate which is made to project beyond the furnace, the outside portion (the "work-stone") being provided with grates, gaddies, and tuyeres, of which the last mentioned projects in a "stone" into a cast iron pot; the "tuyère" for the introduction of the wind, was, in the earlier types, about half way down the furnace.

As a preliminary to the melting process, the "brush" left in the preceding operation (half-fused and imperfectly reduced ore) is introduced with some peat and coal, and heated with the help of the blast. It is then raked out on the work-stone and divided into a very poor green slag which is put aside, and a richer portion, which goes back into the furnace. Some of the roasted ore is stirred upon it, and, after a quarter of an hour's working, the whole is taken out on the work-stone, where the lead produced runs off. The lead, formed on the bottom of the hearth, is spread over with some head and then mixed with it, the mass added, and, after a quarter of an hour's heating, the mass again placed on the work-stone, &c.

In the more recent form of the process the blocks of cast iron are laid back to back and the ore, which is generally replaced in the United States by water-cooled shells (waterjackets) of cast iron. In this way continuous working has been rendered possible, whereas formerly operations had to be stopped every hour to remove the melted lead collected in a long hole. The tuyères are usually previously fused into the furnace to cool down. A later improvement (which somewhat changes the mode of working) is that by Moffett. While he also prevents interruption of the operation by means of waterjackets, he uses long tuyeres and tuyères, protected by sheets of iron, which are placed in the furnace to cool down. A later improvement (which somewhat changes the mode of working) is that by Moffett. While he also prevents interruption of the operation by means of waterjackets, he uses long tuyères and tuyères, protected by sheets of iron, which are placed in the furnace to cool down.
process, as it is more expensive and leaves more silver and impurities in the market lead. It holds its own, however, when base bullion contains bismuth in appreciable amounts, as in the Pattinson process bismuth follows the lead to be cupelled, while in the Parkes process bismuth is entirely desilverized (the silver and lead of commerce should contain little bismuth). At Freiberg, Saxony, the two processes have been combined. The base bullion is imperfectly Pattinsonized, giving lead rich in silver and bismuth, which, by being desilverized (the silver and lead of commerce should contain little bismuth), which is further desilverized by the Parkes process.

The effect of the two processes on the purity of the market lead is clearly shown by the following analyses by Hampe, which represent 282 analyses of lead from the Harz Mountains, where the Parkes process replaced that of Pattinson, the ores present being rich in silver.

The reverberatory furnace commonly used for cupelling goes by the name of the English cupelling furnace. It is oblong and has a fixed roof and a movable iron hearth (test). Formerly the test was lined with bone-ash; at present the hearth material is a mixture of crushed limestone and clay (3:1) or Portland cement. The charge, or melted bullion, is tipped into the furnace, and in instances the lining has been made of burnt magnesia. In the beginning of the operation enough argoniferous lead is charged to fill the cavity of the test. After it has been melted down and brought to a molten condition, the cupellation begins. Acid oxide, which drives the lārge formed towards the front, where it is run off. At the same time small bars of argoniferous lead, inserted at the back, are slowly pushed forward, so that melting down they may replace the lost. The charge is thus kept low, so that the distance, often constant, and the silver becomes concentrated in the lead. In large works the silver-lead alloy is removed when it contains 60-80% silver, and the cupellation of the rich bullion from several concentration furnaces is done in a furnace similar to the one described. The slag from the silver bullion is brought to the required degree of fineness, usually by the use of nitré. In small works the cupellation is finished in one furnace, and the resulting low-grade silver flot in a plumago crucible, either by overheating in the presence of air, or by the addition of silver sulphate to the melted silver, when air or sulphur trioxide and oxygen oxidize the impurities. The lead contained contains 1-5% lead if it comes from a Pattinson plant, from 5-10% if from a Parkes plant. The cupellation is continued for about 6-8 tons of lead is cupelled in twenty-four hours. A furnace is served by three men, working in eight-hour shifts, and requires about two tons of coal, which corresponds to about 110 gallons reduced oil, air being used as atomizer. The loss in lead is about 5%. The latest cupelling furnaces have the general form of a reverberatory copper-smelting furnace. The working door through which the cupellation is run off lies under the flue which carries off the products of combustion. In cupelling furnaces, the lead is charged and the blast is admitted near the fire-place.

In the Pattinson process the argiferous lead is melted down in the central cast iron kettle of a series 8-15, placed one next to the other, and covered with a dome shaped over them. A second cast iron kettle (the hearth) is placed beneath the kettle in the same cast iron vessel (the hearth). This vessel has been in many cases replaced by the Lucez-Rosan process (1870), which does away with arduous labour and attains a more satisfactory crystallization. The plant consists of two lifting oval metal cans (capacity 7 tons), one cylindrical crystallizing pot (capacity 22 tons), with two discharging spouts and one steam inlet opening; two lead moulds (capacity 3 tons), and a steam crane. Pans and pots are heated from separate fire-places. Supposing the main kettle filled with lead and the hearth charged, the fire is drawn beneath and steam introduced. This cools and stirs the lead when crystals begin to form. As soon as two-thirds of the lead has separated in the form of crystals, the steam is shut off and the liquid lead is removed through the two spouts in the sides of the kettle.

In the meantime the lead in the hearth is removed by the same process. The lead in the two cans, which has solidified, is removed with the source and stacked to one side, until its turn comes to be raised and charged into one of the cans. The crystallization proper lasts one hour, the working of a charge of four hours, six charges being run in twenty-four hours.

It is absolutely necessary for the success of the Parkes process that the zinc and lead should contain only a small amount of impurity. The spelter used must therefore be of a good grade, and the lead is usually first refined in a reverberatory cupelling furnace. The zinc of the furnace must be 10% greater than that of the kettle into which the softened lead is tapped, as the dress and skimmings formed amount to about 10% of the weight of the lead charged. The dressing is removed by a rake and thrown into the kettle and left to stand on a wall; it is usually of cast iron. Most kettles at present hold 30 tons of lead; some, however, have double that capacity. When zinc is placed on the lead (heated to above the melting point of zinc) it is quickly absorbed by the liquid, with the result that a large proportion of the lead is removed with the dressing; the lead is therefore stirred, gold, copper, silver and lead will combine with the zinc in the order given. By beginning with a small amount of zinc, all the gold and copper and some silver and lead will be alloyed with the zinc to a so-called zinc-silver-carbon-lead, and the residual lead saturated with zinc. By removing from the lead of the zinc, and working up the dressing separately, a great deal of silver is obtained by the second addition, and a little copper and lead. The zinc is added in a fluid state, which is poured into the molten zinc-silver-lead crust, which, when worked up, gives fine silver.

A third addition becomes necessary to remove the rest of the silver, when the lead will assay 0-1 oz. silver per ton. As this completes the saturation of the lead, the unsaturated zinc-silver-lead crust is put aside to form part of the second refining of the following charge. In skimming the crust from the surface of the lead the unsaturated zinc-silver-lead crust is also used; this crust is then a mixture of zinc, lead and silver, which is finally allowed to fall into the charge. The zinc-silver-lead crust was added to the charge, in which as, running lower in silver than the crust, it will otherwise reduce its silver content and increase the amount of lead to be cupelled. A zincing takes 5-6 hours; 1:5-2:5% zinc is required. The zinc-silver-lead crust contains 5-10% silver, 30-40% zinc and 65-50% lead. Before it is added to lead it has to be freed from most of the zinc, which is accomplished by distilling in a retort made of a mixture similar to that of the plumago crucible. The retort is pear-shaped, and holds 1000-1500 lb of charge, consisting of liquated crust mixed with 10% of charcoal. The condenser commonly used is an old retort. The distillation of 1000 lb charge lasts 5-6 hours, requires 500-600 lb cold water, and gives about 10 lb metallic zinc and 1:5% blue powder—a mixture of finely-divided metal zinc and zinc oxide. About 60% of the zinc used in desilverizing is recovered in a form to be used again. One man serves 2-4 retorts. The desilverized lead, which retains 0-5-0-7% zinc, has to be refined before it is suited for industrial use. The operation is carried out in a reverberatory furnace or in a kettle. In the reverberatory furnace, similar to the one used in softening, the lead is brought to a brightness, and, being allowed to settle, the air is allowed to pass. The zinc and some lead are oxidized; part of the zinc passes off with the furnace gases dissolved by the forming a melted mixture which is skimmed off and reduced in a blast-furnace or a reverberatory smelting furnace. The lead is then passed over to a blast-furnace, the process by means of dry steam, and incidentally some lead by the air which can be completely excluded. A yellowish powder mixture of zinc and lead oxides collect on the lead; it is skimmed off and sold as paint. From the reverberatory furnace or the kettle the refined lead is skimmed off into a storage (market) kettle after it has cooled somewhat, and from this it is skimmed off into moulds placed in a semi-circle on the floor. In the process the yield in metal, based upon the charge in the kettle, is lead 90-95% silver 100-120%, gold 96-97%. The plus-silver is due to the fact that in the process of adding the zinc-silver-lead crust by cupellation, the silver lost by volatilization and cupellation alone is neglected. In the United States the cost of desilverizing a ton base bullion is about $6.

Properties of Lead.—Pure lead is a feebly lustrous bluish-white metal, endowed with a characteristically high degree of softness and plasticity, and almost entirely devoid of elasticity. Its breaking strain is very small; a wire 1/4 inch in thickness is ruptured by a charge of about 30 lb. The specific gravity is 11.522 for ingot, and from 11.352 to 11.365 for sheet lead (water of 4°C. = 1). The expansion of unit-length from 0° C. to 100° C. = 0.002495 (Fizeau). The conductivity for heat (Wiedemann and Franz) or electricity is 8-5, that of silver being taken as 100. It melts at 327-360° C. (H. L. Calendrier); at a bright-red heat it perceptibly vapourizes, and boils at a temperature between 1450° and 1600°. The specific heat is 0.315 (Regnault). Lead exposed to ordinary air is rapidly tarnished, but the thin dark film formed is very slow in increasing. When kept fused in the presence of air lead readily takes up oxygen, with the formation
LEAD

at first of a dark-coloured scum, and then of monoxide PbO, the rate of oxidation increasing with the temperature.

When water absolutely pure has no action on lead, but in the presence of air the lead is quickly attacked, with formation of the hydrate, Pb(OH)₄, which is appreciably soluble in water forming an alkaline liquid. When carbonic acid is present the dissolved oxide is soon precipitated as basic carbonate, so that the corrosion of the lead becomes continuous. Since all soluble lead compounds are strong cumulative poisons, danger is involved in using lead cisterns or pipes in the distribution of pure waters.

The word "pure" is emphasized because experience shows that the presence in a water of even small proportions of calcium bicarbonate or sulphate prevents its action on lead. All impurities do not act in a similar way. Ammonium nitrate and nitrite, for instance, intensify the action of a water on lead. Even pure waters, however, such as that of Loch Katrine (which forms the Glasgow supply), act so slowly, at least on such lead pipes as have already been in use for some time, that there is no danger in using short lead service pipes even for them, if the taps are being constantly used. Lead cisterns must be unhesitatingly condemned.

The presence of carbic acid in a water does not affect its action on lead. Aqueous non-oxidizing acids generally have little or no action on lead in the absence of air. Dilute sulphuric acid (say an acid of 20%, H₂SO₄ or less) has no action on lead even when air is present, nor on boiling. Strong acid does act, the more so the greater its concentration and the higher its temperature. Pure lead is far more readily corroded than a metal contaminated with 1% or even less of antimony or copper. Boiling concentrated sulphuric acid converts lead into sulphate, with evolution of sulphur dioxide. Dilute nitric acid readily dissolves the metal, with formation of nitrate Pb(NO₃).

Lead Alloys.—Lead unites readily with almost all other metals; hence, on account of its being used for the extraction of (for instance) silver, its alethic name of saturnus. Of the alloys the following may be named:

With Antimony. Lead contaminated with small proportions of antimony is more highly proof against sulphuric acid than the pure metal. An alloy of 83 parts of lead and 17 of antimony is used as type metal: other proportions are used, however, and other metals added besides antimony (e.g. tin, bismuth) to give the alloy certain properties.

Arsenic roders lead harder. An alloy made by addition of about 1/4th of arsenic has been used for making shot.

Bismuth and Antimony.—An alloy consisting of 9 parts of lead, 2 of antimony, and 1 of bismuth, is more highly proof against sulphuric acid than the pure metal. An alloy of 83 parts of lead and 17 of antimony is used as type metal: other proportions are used, however, and other metals added besides antimony (e.g. tin, bismuth) to give the alloy certain properties.

"Pewter" (g.s.) may be said to be substantially an alloy of the same two metals, but small quantities of copper, antimony and zinc are frequently added.

Compounds of Lead.

Lead generally functions as a divalent element of distinctly metallic character, yielding a definite series of salts derived from the oxide PbO. At the same time, however, it forms a number of compounds in which it is most decidedly tetravalent; and thus it shows relations to carbon, silicon, germanium and tin.

Oxides. Lead combines with oxygen to form five oxides, viz. PbO, PbO₂, PbO₃, PbO₄ and PbO₅. The suboxide, PbO₂, is the first product of the oxidation of lead, and is also obtained as a black powder when lead is fused with saltpetre. Its melting-point is 947°C. It ignites when heated in air with the formation of the monoxide; dilute acids convert it into metallic lead and lead monoxide, the latter dissolving in the acid. The monoxide, PbO₂, occurs in nature as the mineral lead ochre. This oxide is produced by heating lead, with a rapid current of air, in contact with water. It is manufactured in two forms, known as "massicot" and "lichtarge." The former is produced at temperatures below, the latter at temperatures above the fusing-point of the oxide. The liquid lichtarge when allowed to cool solidifies into a hard stone-like mass, which, however, when left to itself, soon crumbles up into a heap of resplendent dark yellow scales known as "false lichtarge." "Buff" or "levigated lichtarge" is prepared by grinding the larger pieces under water. Lichtarge is much used for the preparation of lead salts, for the manufacture of oil varnish, of certain enamels, and of lead plaster, and for other purposes. Massicot is the raw material for the manufacture of "_parallel form."

Lead monoxide is dimorphous, occurring as cubical dodecahedra and as rhombic octahedra. Its specific gravity is about 9; it is sparingly soluble in water, but readily dissolves in acids and molten alkali hydroxides and in ammonium and the lower aliphatic salts (Zeit. anorg. Chem., 1906, 50, p. 265). The corresponding hydrate, Pb(OH)₄, is obtained as a white crystalline precipitate by adding ammonia to a solution of lead nitrate or acetate. It dissolves in an excess of formic acid to form Pb(OH)₃CO₂. It is said to absorb carbon dioxide from the air when moist. A hydrated oxide, 2PbO·H₂O, is obtained when a solution of the monoxide in potash is treated with carbon dioxide.

Lead dioxide, PbO₂, also known as "pure oxide," occurs in nature as the mineral platymine, and may be most conveniently prepared by heating mixed solutions of lead acetate and bleaching powder until the original precipitate blackens. The solution is filtered, the precipitate well washed, and, generally, is put up in the form of a dry powder. Lead dioxide is used in plating, in the manufacture of the lead dichromate and lead chromate; the lead nitrate and lead chromate; and the lead chromate.

Lead oxide or PbO, known as "oxide of lead," is obtained by heating lead oxide to a temperature of below 95° C. It is used in plating, in the manufacture of the lead dichromate and lead chromate; the lead nitrate and lead chromate; and the lead chromate.

Lead sesquisulphide, PbS, is obtained as a red-brownish amorphous powder by carefully adding sodium hypochlorite to a cold potash solution of lead oxide. By adding to a dilute ammonia solution of lead oxide a solution of red lead in acetic acid. It is decomposed by acids into a mixture of lead monoxide and dioxide, and may thus be regarded as lead metatellurium, Pb₂Sb₂O₇. Red lead or triplumbic tetroxide, Pb₃O₄, is a yellow powder, obtained by roasting very finely divided pure massicot or lead carbonate; the brightness of the colour depends in a great measure on the roasting. Pinny mentions it under the name of minium, but it is not at all the same as the ordinary lead pigment of that name. Dioxides mentions its preparation from white lead or lead carbonate. On heating it assumes a finer colour, but then turns violet and finally black; regaining, however, its original colour on cooling. Its most common use is in the manufacture of the pigment red lead, Pb₃O₄, by roasting it with starch and gelatin. Dioxide is used in the manufacture of red lead and lead black. It is also used as a pigment and in the manufacture of flint glass.

Lead chloride, PbCl₂, occurs in nature as the mineral crotalusite, which crystallizes in the rhomboedric system, and is found in the neighborhood of volcanic craters. It is artificially obtained by adding hydrochloric acid to a solution of lead salt, as a white precipitate,
little soluble in cold water, less so in dilute hydrochloric acid, more so in the strong acid, and readily soluble in hot water, from which on cooling, the excess of dissolved salt separates out in silky rhombic needle-shaped crystals, somewhat similar to those formed in the horn-like mass; an early name for it was *plumbum corneum*, horn lead. A basic chloride, *Ph(OH)Cl*, was introduced in 1849 by Patrinson as a substitute for white lead. Powdered galena is dissolved in water by precipitating the precipitate with hydrochloric acid, adding a deposit of impure lead chloride washed with cold water to remove iron and copper. The residue is then dissolved in hot water, filtered, and the clear solution is mixed with very thin milk of lime so adjusted that it is neutral to phenolphthalein. The addition of the precipitated lead chloride comes down as an amorphous white precipitate. Another chloroxychloride, *PhCl$_2$7PF$_6$*, known as "Cassell yellow," was prepared by Vaaqelin by fusing pure oxide, *PhO*, with one-tenth of its weight of pure white lead in a crucible, and after the yellow solution had been artificially prepared oxochloride, used as a pigment. Manganese and malachite are mineral oxochlorides.

**Lead fluoride**, *PhF$_3$*, is a white powder obtained by precipitating a lead salt with a soluble fluoride; it is sparingly soluble in water but readily dissolves in hydrochloric and nitric acids. A chloro-fluoride, *PhClF*, is obtained by adding sodium fluoride to a solution of lead chloride. Lead fluoride, *PhF$_3$*, a white solid, and lead oxide, *PhO*, a yellow solid, are prepared by precipitating a lead salt with a soluble bromide or iodide; they resemble the chloride in solubility.

**Lead carbonate**, *PhCO$_3$*, occurs in nature as the mineral cerussite (q.v.). It is produced by the addition of a solution of lead salt in an excess of ammonium carbonate, as an almost insoluble white precipitate. Of greater practical importance is a basic carbonate, *PhCO$_3$N* (Libavius, later called *cerussa*), lead carbonate, with which the name of "white lead" is associated. Thopasthus called it *wolithe*, and prepared it by acting on lead with vinegar, and Pliny, who called it *cerausa*, obtained it by dissolving lead acetate in vinegar. Evidently, it is possible that lead carbonate was a compound of lead, lead oxide, and sugar of lead were undifferentiated. Geber gave the preparation in a correct form, and T. O. Bergman proved its composition. This pigment is manufactured by several methods. In the old Dutch method, pieces of sheet lead are suspended in stoneware pots so as to occupy the upper two-thirds of the vessels. A little vinegar is poured into each pot; they are then covered with plates of sheet lead, buried in horse-dung or spent tanner's bark, and left in the lime kiln for a considerable time. By the action of the acetic acid and atmospheric oxygen, the lead is converted super-ficially into a basic carbonate, which is at once decomposed by the carbon dioxide, with formation of white lead and acetic acid, which latter is removed by evaporation, while the precipitate is washed to a more or less considerable depth into crusts of white lead. These are knocked off, ground up with water, freed from metal-particles by elutriation, and the paste of white lead is allowed to set and dry in small conical terms. The German method differs from the Dutch inasmuch as the lead is suspended in a large chamber heated by ordinary means, and there exposed to the simultaneous action of vaporised acetic acid and carbon dioxide. The operation depends upon the formation of lead carbonate by grinding together litharge with salt and water, and then treating the alkaline fluid with carbonate until it is neutral. White lead is an earthy, amorphous white precipitate of inferior pigmentary properties. Lead 6 are produced by mixing the genuine article with more or less of finely powdered heavy spar or occasionally zinc-white (ZnO). Venetian white, Hamburg white and Dutch white are mixtures of one part of white lead with one, two and three parts of barium sulphate respectively.

**Lead sulphide**, *PhS*, occurs in nature as the mineral galena (q.v.), and constitutes the most valuable ore of lead. It may be artificially prepared by leading sulphur vapour over lead, by fusing litharge with sulphur, or, as a black precipitate, by passing sulphuretted hydrogen into a solution of a lead salt. It dissolves in strong nitric acid with the formation of the nitrate and sulphate, and also in hot hydrochloric and nitric acids.

**Lead sulphate**, *PhSO$_4$*, occurs in nature as the mineral anglesite (q.v.), and may be prepared by the addition of sulphuric acid to solutions of lead salts, as a white precipitate almost insoluble in water. In 2.5 molar strength, it is completely soluble in nitric acid (1 in 36.50) and insoluble in alcohol. Ammonium sulphate blackens it, and it is soluble in solution of ammonium acetate, which distinguishes it from barium sulphate. Strong sulphuric acid dissolves it, forming an ecalor gas, *Ph$_2$O$_5$SO$_4$* (Hedwig), which is hydrolyzed by the addition of normal sulphate being precipitated; hence the milkiness exhibited by samples of oil of vitriol on dilution.

**Lead nitrate**, *PhN$_2$O$_5$*, is obtained by dissolving the metal or oxide in an excess of nitric acid. It forms white crystals, difficultly soluble in cold water, readily in hot water and almost insoluble in strong nitric acid. It was mentioned by Libavius, who named it *gala*, and was frequently used as a fixing agent in photography by its power of fixing silver by forming silver nitrate and oxygen and; and is used for the manufacture of fusibles and other delagating compounds, and also for preparing mordants in the dyeing and calico-printing industries. Basic nitrates, e.g. *Ph(NO)$_3$*OH, *Ph$_2$O$_2$$_3$(OH), *Ph(NO)$_3$(OH), *Ph$_2$O$_2$$_3$NO, &c., have been described.

**Lead phosphates.**—The normal ortho-phosphate, *Ph$_3$OPO$_4$*, is a white precipitate obtained by adding sodium phosphate to lead acetate; the acid phosphate, *PhHPO$_4$*, is produced by precipitating a boiling solution of lead nitrate with phosphoric acid; the pyrophosphate, *Ph$_2$PO$_4$*, is obtained by adding borax to a lead salt; this on heating with strong ammonium gives *Ph$_2$O$_2$$_3$H$_2$O*, which, in turn, when boiled with a solution of boric acid, gives *PhBO$_2$H$_2$O*.

**Lead borates.—**By fusing litharge with boron trioxide, glasses of a composition varying with the proportions of the mixture are obtained; some of these are used in the manufacture of glass. The borate, *Pb$_3$O$_4$*·$3$H$_2$O, already obtained as a white precipitate of lead borate by adding borax to a lead salt; this on heating with strong ammonium gives *Pb$_2$O$_2$$_3$H$_2$O*, which, in turn, when boiled with a solution of boric acid, gives *PhBO$_2$H$_2$O*.

**Lead chromate**, *PhCrO$_4$*, is prepared industrially as a yellow pigment, *perline*, by precipitating a lead salt with potassium bichromate. The beautiful yellow precipitate is little soluble in dilute nitric acid, but soluble in caustic potash. The vermilion-like pigment which occurs in commerce as "chrome" is a basic chromate, *PhCrO$_4$*·*H*$_2$O, prepared by treating recently precipitated normal chromate with a properly adjusted proportion of caustic soda, or by boiling it with normal (yellow) potassium chromate.

**Lead acetate**, *Ph(C$_2$H$_3$O$_2$)$_2$*·$3$H$_2$O (called "sugar" of lead, on account of its sweetish taste), is manufactured by dissolving massicot in aqueous acetic acid. It forms colourless transparent crystals, dull yellow and a half parts of cold water and in eight parts of alcohol, which on evaporation through absorption of carbonic acid, which forms a crust of basic carbonate. An aqueous solution readily dissolves lead oxide, with formation of an impure basic carbonate. The precipitate is prepared by treating respectively precipitated normal chromate with a properly adjusted proportion of caustic soda, or by boiling it with normal (yellow) potassium chromate.

**Lead reactate**, *Ph(C$_2$H$_3$O$_2$)$_2$*·$3$H$_2$O (called "sugar" of lead, on account of its sweetish taste), is manufactured by dissolving massicot in aqueous acetic acid. It forms colourless transparent crystals, dull yellow and a half parts of cold water and in eight parts of alcohol, which on evaporation through absorption of carbonic acid, which forms a crust of basic carbonate. An aqueous solution readily dissolves lead oxide, with formation of an impure basic carbonate. The precipitate is prepared by treating respectively precipitated normal chromate with a properly adjusted proportion of caustic soda, or by boiling it with normal (yellow) potassium chromate.

An analysis of lead is made in the following preparations:

(a) *Fusil* Plumbi cum Oppio, the strength of the opium in it being t in 8, dose 2 to 4 grains; (b) *Suppositoria Plumbi composita*, containing lead acetate, opium and oil of othoreba, there being one grain of opium in each suppository; (c) *Unguentum Plumbi Acetatis*; (d) *Liquor Plumbi Subacetatis Fortior*, containing 30% of the extract, strength 24% of the subacetate; this again has a sub-preparation, the *Liquor Plumbi Subacetatis Dilatatis*, called Goulard's water or Goulard's lotion, containing 1 part in 8 of the strong extract; (e) *Glycerin Plumbi Subacetatis*, from which is made the Unguentum Glycerini Plumbi Subacetatis. (3) *Plumbi Carbonas*, white lead, a mixture of the carbonate and the hydrate, a heavy white powder insoluble in water; it is not used internally, but from it is made Unguentum Plumbi Carbonatis, strength 1 in 10 parts of paraffin ointment. (4) *Plumbi Iodidum*, a heavy bright yellow powder not used internally. From it are made (a) *Emplastrum Plumbi Iodidi*, and (b) *Unguentum Plumbi Iodidi*. The strength of each is t in 12; it is used externally, lead salts having practically no action upon the unbroken skin, but applied to sores, ulcers or any exposed mucous membranes they coagulate the albumen in the tissues themselves and contract the small vessels. They are very astringent, haemostatic and sedative; the strong solution of the
LEADER—LEAD POISONING

Lead acetate is powerfully caustic and is rarely used undiluted. Lead salts are applied as lotions in conditions where a sedative action is desired, as in weeping eczema; in many varieties of chronic ulceration; and as an injection for various inflammatory discharges from the vagina, ear, and urethra, the Liquor Plumbi Subacetatis Dilutum being the one employed. The sedative effect of lead lotion in pruritus is well known. Internally lead has an astringent action on the mucous membranes, causing a sensation of dryness; the dilute solution of the subacetate forms an effective gargle in tonsilitis. The chief use of the preparations of lead, however, is as an astringent in acute diarrhoea, particularly if ulceration be present, when it is usefully given in combination with opium in the form of the Pilula Plumbi cum Opio. It is useful in haemorrhage from a gastric ulcer or in haemorrhage from the intestine. Lead salts usually produce constipation, and lead is an active eczematous. Lead is said to enter the blood as an albuminate in which form it is deposited in the tissues. As a rule the soluble salts if taken in sufficient quantities produce acute poisoning, and the insoluble salts chronic plumbism. The symptoms of acute poisoning are pain and diarrhoea, owing to the setting up of an active gastro-enteritis, the foeces being black (due to the formation of a sulphonate of lead), thirst, cramps in the legs and muscular twitches, with torpor, collapse, convulsions, and coma. The treatment is the prompt use of emetics, or the stomach should be washed out, and large doses of sodium or magnesium sulphate given in order to form an insoluble sulphate. Stimulants, warmth and opium may be required. For an account of chronic plumbism see Lead Poisoning.

LEADER, BENJAMIN WILLIAMS (1831–77). English painter, the son of E. Leader Williams, an engineer, received his art education first at the Worcester School of Design and later in the schools of the Royal Academy. He began to exhibit at the Academy in 1854, was elected A.R.A. in 1883 and R.A. in 1889, and became exceedingly popular as a painter of landscape. His subjects are attractive and skilfully composed. He was awarded a gold medal at the Paris Exhibition in 1889, and was made a knight of the Legion of Honour. One of his pictures, "The Valley of the Llugwy," is in the National Gallery of British Art.

LEADHILLITE, a rare mineral consisting of basic lead sulphate-carbonate, Pb₄SO₄(CO₃)₂(OH)₉. Crystals have usually the form of six-sided plates (fig. 1) or sometimes of acute rhombohedra (fig. 2); they have a perfect basal cleavage (parallel to P in fig. 1) on which the lustre is strongly pearly; they are usually white and translucent. The hardness is 2 to 5 and the sp. gr. 6.26–6.44. The crystallographic and optical characters point to the existence of three distinct kinds of leadhilithe, which are, however, identical in external appearance and may even occur intergrown together in the same crystal: (a) monoclinic with an optic axial angle of 20°; (b) orthorhombical (fig. 2) and optically uniaxial; (c) orthorhombical (fig. 1) with an optic axial angle of 72°. The first of these is the more common kind, and the second has long been known under the name susannite. The fact that the published analyses of leadhilithe vary somewhat from the formula given above suggests that these three kinds may also be chemically distinct.

Leadhilithe is a mineral of secondary origin, occurring with cerussite, anglesite, &c., in the oxidized portions of lead-bearing lodes; it has also been found in weathered lead slags left by the Romans. It has been found most abundantly in the Susanna mine at Leadhills in Scotland (hence the names leadhilithe and susannite). Good crystals have also been found at Red Gill in Cumberland and at Granby in Missouri. Crystals from Sardinia have been called maxite.

LEADHILLS, a village of Lanarkshire, Scotland, 52 m. W.S.W. of Elvanfoot station on the Caledonian Railway Company's main line from Glasgow to the south. Pop. (1901) 835. It is the highest village in Scotland, lying 1300 ft. above sea-level, near the source of Glengonnor Water, an affluent of the Clyde. It is served by a light railway. Lead and silver have been mined here and at Wanlockhead, 13 m. S.W., for many centuries—according to some authorities even in Roman days. Gold was discovered in the reign of James IV., but though it is said then to have provided employment for 300 persons, its mining has long ceased to be profitable. The village is neat and well built, and contains a masonic hall and library, the latter founded by the miners about the middle of the 18th century. Allan Ramsay, the poet, and William Symington (1763–1831), one of the earliest adaptors of the steam engine to the purposes of navigation, were born at Leadhills.

LEAD POISONING, or Plumbism, a "disease of occupations," which is itself the cause of organic disease, particularly of the nervous and urinary systems. The workpeople affected are principally those engaged in potteries where lead glaze is used; but other industries in which health is similarly affected are file-making, lead smelting, and glass-making, all of which require skill in the melting of the. The symptoms of chronic lead poisoning vary with the limits, from colic and constipation up to total blindness, paralysis, convulsions and death. They are thus described by Dr J. T. Arlidge (Diseases of Occupations):

The poison finds its way gradually into the whole mass of the circulating blood, and exerts its effects mainly on the nervous system, paralysing nerve-force and with it muscular power. It is very difficult to determine the immediate cause of death in cases of lead-poisoning, and one thing is certain: the functions of the stomach and bowels are deranged, appetite fails and painful colic with constipation supervenes. The loss of power is generally shown first in the fingers, hands and wrists, and the condition known as "lead poisoning" follows. The workman becomes maladroit in his work; the palsy will extend to the shoulders, and after no long time to the legs also. Other organs frequently involved are the kidneys, the disease of which becomes permanently damaged; whilst the sight is weakened or even lost.

Dr M'aldowie, senior physician to the North Staffordshire Infirmary, has stated that "in the pottery trade lead is very slow in producing serious effects as compared with certain other industries." In his experience the average period of working in lead before serious lesions manifest themselves is 18 years for females and 22 years for males. But some individuals fall victims to the worst forms of plumbism after a few months or even weeks' exposure to the danger. Young persons are more readily affected than those of mature age, and women more than men. In addition, there seems to be an element of personal susceptibility, the nature of which is not understood. Some persons "work in the lead" for twenty, forty or fifty years without the slightest ill effects; others have attacks whenever they are brought into contact with it. Possibly the difference is due to the general state of health; robust persons resist the poison successfully, those with impoverished blood and feeble constitution are mastered by it. Lead enters the body and is distributed throughout the bloodstream, being inspired in the form of dust or swallowed with food eaten without washing hands. It is very apt to get under the nails, and is possibly absorbed in this way through the skin. Personal care and cleanliness are therefore of the greatest importance. A factory surgeon of great experience in the English Potteries.
has stated that seventeen out of twenty cases of lead-poisoning in the china and earthenware industry are due to carelessness (The Times, 8th October 1898).

The Home Office in England has from time to time made special rules for workshops and workpeople, with the object of minimizing or preventing the occurrence of lead-poisoning; and in 1895 notification of cases was made compulsory. The health of workpeople in the Potteries was the subject of a special inquiry by a scientific committee in 1893. The committee stated that “the general truth that the potteries occupation is one fraught with injury to health and life is beyond dispute,” and that “the ill effects of the trade are referable to two chief causes—namely, dust and the poison of lead.” Of these the inhalation of dust is, it was discovered, the more important; only 19% of the cases led to bronchitis, pulmonary tuberculosis and pneumonia, which were the most prevalent disorders among potters, and responsible for 70% of the mortality. That from lead the committee did not attempt to estimate, but they found that plumblum was less prevalent than in past times, and expressed the opinion “that a large part of the mortality from lead poisoning is avoidable; although it must always be borne in mind that no arrangements or rules, with regard to the work itself, can entirely obviate the effects of the poison to which workers are exposed, because so much depends upon the individual and the observance of personal care and cleanliness.”

They recommended the adoption of certain special rules in the workshops, with the objects of protecting young persons from the lead, of minimizing the risk of dust, and of keeping cleanliness, particularly in regard to meals. Some of these recommendations were adopted and applied with good results. With regard to the suggestion that “only leadless glazes should be used on earthenware,” they did not “see any immediate prospect of such glazes becoming universally applicable to pottery manufacture,” and therefore turned their attention to the question of “fritting” the lead.

It may be explained that lead is used in china and earthenware to give a white (or nearly white) glaze, which renders the naturally porous ware watertight. Both “white” and “red” lead are used. The lead is added to other ingredients, which have been “fritted” or fused together and then ground very fine in water, making a thick creamy liquid into which the articles are dipped. After drying the glaze dries quickly, and on being fired “in the kiln it becomes fused by the heat into the familiar glassy surface. In the manufacture of ware enamelled colours, glaze is mixed with the pigment to form a flux, and such colours are used either singly or in the form of a dry powder. “Fritting” the lead means mixing it with the other ingredients of the glaze beforehand and fusing them all together under great heat into a kind of rough glass, which is then ground to make the glaze. This in turn is the way the lead combines with other ingredients and becomes less soluble, and therefore less dangerous, than when added afterwards in the raw state. The committee (1893) thought it “reasonable to suppose that the fritting of lead might ultimately be found universally practicable,” but declared that “though fritting” no doubt diminishes the danger of lead-poisoning,” they “could not regard all frits as equally innocuous”.

In the annual report of the chief inspector of factories for 1897, it was stated that there had been “material improvement in dust conditions” in the potting industry, but “of lead-poisoning unfortunately the same could not be said the number of cases reported has increased, and partly because of blindness, having ominously increased of late.” This appears to have been largely due to the erroneous inclusion among potting processes of “litho-transfer making,” a colour industry in which girls are employed. New special rules were imposed in 1899 prohibiting the employment of persons under fifteen in the dangerous processes, ordering a monthly examination of all women and young persons working in lead by the certifying surgeon, with power to suspend those showing symptoms of poisoning, and providing for the more effectual removal of dust and the better enforcement of cleanliness. At the same time a scientific inquiry was ordered into the practicability of dispensing with lead in glazes or of substituting fritted compounds for the raw carbonate. The possibility of a substitute which could be used and in which the use of raw lead should be absolutely prohibited, and expressing the opinion that the greater amount of earthenware could be successfully glazed without any lead. These views were in advance of the opinions held by practical potters, and met with a good deal of opposition. By certain manufacturers considerable progress had been made in diminishing the use of raw lead and towards the discovery of satisfactory leadless glazes; but it is a long step from individual experiments to the wholesale compulsory revolution of the processes of manufacture in so large and varied an industry, and in the face of foreign competitors hampered by no such regulations. The materials used by each manufacturer have been arrived at by a long process of experience, and they are such as to suit the particular goods he supplies for his particular market. It is therefore difficult to apply a uniform rule without jeopardizing the prosperity of the industry, which supports a population of 250,000 in the Potteries alone. However, the bulk of the manufacturers regard the leadless glaze as an evil which will not be found in future, time being allowed to effect the change of process; but they declined to be bound to any particular composition of glaze for the reasons indicated.

In 1901 the Home Office brought forward a new set of special rules. Most of these were framed to strengthen the provisions for securing cleanliness, removing dust, &c., and were accepted with a few modifications. But the question of making even more stringent regulations, even to the extent of making the use of lead-glaze illegal altogether, was still agitated; and in 1906 the Home Office again appointed an expert committee to reinvestigate the subject. They reported in 1910, and made various recommendations in detail, for strengthening the existing regulations; but in the main they were against the substitution of leadless glazes in certain sorts of common ceramic ware, they pointed out that, without the use of lead, certain other sorts could either not be made at all or only at a cost or sacrifice of quality which would entail the loss of important markets.

In 1908 Dr Collis made an inquiry into the increase of plumblum in connexion with the smelting of metals, and he considered the increase in the cases of poisoning reported to be due to the third method by which the Workmen’s Compensation Board met the prevalence of pre-existing plumblum to come to light. (2) by the tendency this fostered to replace men suspected of lead impregnation by new hands amongst whom the incidence is necessarily greater.

**LEADVILLE**, a city and the county seat of Lake county, Colorado, U.S.A., one of the highest (mean elevation 10,150 ft.) and most celebrated mining "camps" of the world. Pop. (1900) 14,455, of whom 3802 were foreign-born; (1910 census) 18,979. The city is served by the Denver & Rio Grande, the Colorado & Southern and the Colorado Midland railways. It lies amid towering mountains on a terrace of the western flank of the Mosquito Range at the head of the valley of the Arkansas river, where the river cuts the valley between the Mosquito and the Sawatch (Saguache) ranges. Among the peaks in the immediate environs are Mt. Massive (4,424 ft., the highest in the state) and Elbert Peak (4,421 ft.). There is a United States fish hatchery at the foot of Mt. Massive. In the spring of 1860 placer gold was discovered in California Gulch, and by July 1866 Oro City had probably 15,000 inhabitants. In five years the total yield was more than $5,000,000; then it diminished, and the city shrank to a few hundred inhabitants. The most important mining was within the present limits of Leadville. In 1876 the output of the mines was about $20,000. During sixteen years "heavy sands" and great boulders that obstructed the placer fields had been moved thoughtlessly to one side. These boulders were from enormous lead carbonate deposits extremely rich in silver. The discovery of these deposits was made on the hills at the edge of Leadville. The first building was erected in June 1877; in December there were several hundred miners, in January the town was organized and named; at the end of 1879 there were, it is said, 35,000 inhabitants. Leadville was already a chartered city, with the usual organization and all public facilities. In 1880 it was reached by the Denver & Rio Grande railway. In early years Leadville was one of the most turbulent, discontented, and corrupt of the mining camps of the West. The value of the output from 1875 to 1889 totalled $147,834,186, including one-fifth of the silver production and a third of the lead consumption of the country. The decline in the price of silver, culminating with the closing of the **index** mints
and the repeal of the Sherman Law in 1893, threatened Leadville's future. But the source of the gold of the old placers was found in 1892. From that year to 1899 the gold product rose from $262,602 to $2,183,322. From 1879 to 1900 the camp yielded $250,000,000 (as compared with $8,800,000 of gold and silver in five years from the Comstock, Nevada, lode; and $60,000 and 225,000 tons of lead, in fourteen years, from the Eureka, Nevada, mines). Before 1808 the production of zinc was unimportant, but in 1906 it was more valuable than that of silver and gold combined. This increased output is a result of the establishment of concentrating mills, in which the zinc content is raised from 18 or 20% in the raw ores to 25 or 45% in the concentrates. In 1904, per ton of Lake county ore, zinc was valued at $6.93, silver at $4.16, lead at $3.85, gold at $1.77 and copper at $0.60. The copper mined at Leadville amounted to about one-third the total mined in the state in 1906. Iron and manganese have been produced here, and in 1896 Leadville was the only place in the United States known to have produced bismuth. There were two famous labour strikes in the "digging," in 1879 and 1896. The latter attracted national attention; it lasted from the 19th of June 1896 to the 9th of March 1897, when the miners, being practically starved out, declared the strike off. There had been a riot on the 21st of September 1896 and militia guarded the mines for months afterwards. In January 1897 the mines on Carbonate Hill were flooded after the removal of their pumps. This strike closed many mines, which were not opened for several years. Leadville stocks are never on the exchange, and "flotation" and "promotion" have been almost unknown.

The ores of the Leadville District occur in a blue limestone formation overlaid by porphyry, and in the form of heavy sulphides, containing copper, zinc, silver, gold, silver, iron, manganese and small amounts of silver and lead; and siliceous ores, containing much silver and a little lead and gold. The best grade of ores usually consists of a mixture of sulphides, with some native gold, and nowhere have more wonderful advances in mining been apparent—in the size and character of furnaces and pumps; the development of local smelter supplies; the fall in the cost of coal, of explosives and other mine supplies; the development of railways and diminution of freight expenses; and the general improvement of economic and scientific methods—than at Leadville since 1880. The increase of output more than doubled from 1890 to 1900, and many mines once far too low in grade for working now yield sure profits. The Leadville smelters in 1900 had a capacity of 35,000 tons monthly; about as much more local ore being treated at Denver, Pueblo and other places.

LEAF (O. Eng. leaf, cf. Dutch loof, Ger. Laub, Swed. luf, &c.; possibly to be referred to the root seen in Gr. λεπός, to peel, strip), the name given in popular language to all the green expanded organs borne upon an axis, and so applied to similar objects, such as a thin sheet of metal, a hinged flap of a table, the page of a book, &c. Investigation has shown that many other parts of a plant which externally appear very different from ordinary leaves are, in their essential particulars, very similar to them in their morphological development. Such are the scales of a bulb, and the various parts of the flower, and assuming that the structure ordinarily termed a leaf is the typical form, these other structures were designated changed or metamorphosed leaves, a somewhat misleading interpretation. All structures morphologically equivalent with the leaf are now included under the general term phylloplane (leaf-structure).

Leaves are produced as lateral outgrowths of the stem in definite succession below the apex. This character, common to all leaves, distinguishes them from other organs. In the higher plants we can easily recognize the distinction between stem and leaf. Amongst the lower plants, however, it is found that a demarcation into stem and leaf is impossible, but that there is a structure which partakes of the characters of both—such is a thallus. The leaves always arise from the outer portion of the primary meristem of the plant, and the tissues of the leaf are continuous with those of the stem. Every leaf originates as a simple cellular papilla (fig. 1), which consists of a development from the cortical layers covered by epidermis; and as growth proceeds, the fibro-vascular bundles of the stem are continued outwards, and finally expand and terminate in the leaf. The increase in length of the leaf by growth at the apex is usually of a limited nature. In some ferns, however, there seems to be a provison for indefinite terminal growth, while in others this growth is periodically interrupted. It not unfrequently happens, especially amongst Monocotyledons, that after growth at the apex has ceased, it is continued at the base of the leaf, and in this way the length may be much increased. Amongst Dicotyledons this is very rare. In all cases the dimensions of the leaf are enlarged by interstitial growth of its parts.

The simplest leaf is found in some mosses, where it consists of a single layer of cells. The typical foliage leaf consists of several layers, and amongst vascular plants is distinguishable into an outer layer (epidermis) and a central tissue (parenchyma) with fibro-vascular bundles distributed through it.

The epidermis (fig. 2, es, et), composed of cells more or less compressed, has usually a different structure and aspect on the two surfaces of the leaf. The cells of the epidermis are very closely united laterally and contain no green colouring matter (chlorophyll) separating the parietal layer from the epidermis. The outer wall, especially of the upper epidermis, has a tough outer layer or cuticle which renders it impervious to water. The epidermis is continuous except where stomata or spaces are bordered by specialized cells, called epidermal hairs.

The intercellular spaces in the interior of the leaf are chiefly on the epidermis of the lower surface (fig. 2, et) that stomata, st, are produced, and it is there that the cuticle is usually absent. The lower epidermis is often of a dull or pale-green colour, soft and easily detached. The upper epidermis is frequently smooth and shining, and sometimes becomes very hard and dense. Many tropical plants present on the upper surface of their leaves several layers of compressed cells beneath the epidermis which serve for storage of water and are known as spongy tissue, leaves which float upon the surface of the water, as those of the water-lily, the upper epidermis alone possesses stomata. The parenchyma of the leaf is the cellular tissue enclosed within the epidermis and surrounding the vessels (fig. 2, ps, ps). It is known as mesophyll, and is formed of two distinct series of cells, each containing the green chlorophyll-granules, but differing in form and arrangement. Below the epidermis of the upper side of the leaf there are one or two layers of cells, elongated at right angles to the leaf surface (fig. 2, pl), and applied so closely to each other as to leave
only small intercellular spaces, except where stomata happen to be present (fig. 2, m); they form the palisade tissue. On the other side of the leaf the cells are irregular, often branched, and are arranged more or less horizontally (fig. 2, pi), leaving air-spaces between them (fig. 3, which communicates to a stomata; or if this tissue has received the name of spongy. In leaves having a very firm texture, as those of Coniferae and Cucurbitaceae, the cells of the parenchyma immediately beneath the epidermis are very much thickened and elongated in a direction parallel to the surface of the leaf, so as to be fibre-like. These constitute a hypodermal layer, beneath which the chlorophyll cells of the parenchyma are densely packed together, and are elongated in a direction vertical to the surface of the leaf, forming the palisade tissue. The form and arrangement of the cells, however, depend much on the nature of the plant, and its exposure to light and air. Sometimes the arrangement of the cells on both sides of the leaf is similar, as occurs in leaves such as figs. 2, pi. In other cases, as in plants grown in a humid climate or in cultures in which there is insufficient light, the cells are often smaller and more uniform, and the palisade tissue is of a more uniform thickness. In many cases the cells of the palisade tissue are elongated and thickened, and the stomata are large and numerous in the surface of the leaf, and are there arranged in a definite manner. In skeleton leaves, or leaves in which the parenchyma is removed, this arrangement is well seen. In some leaves, as in the barberry, the veins are hardened, producing lignum without any parenchyma. The hardening of the extremities of the fibro-vascular tissue is the cause of the spiny margin of many leaves, such as the holly, of the sharp-pointed leaves of madder, and of mucronate leaves, or those having pointed tips.

The form and arrangement of the parts of a typical foliage leaf are intimately associated with the part played by the leaf in the life of the plant. The flat surface is spread to allow the maximum amount of sunlight to fall upon it, as it is by the absorption of energy from the sun’s rays by means of the chlorophyll contained in the cells of the leaf that the building up of plant food is rendered possible; this process is known as photo-synthesis; the first stage is the combination of carbon dioxide, absorbed from the air taken in through the stomata into the living cells of the leaf, with water which is brought into the leaf by the wood-vessels. The wood-vessels form part of the fibro-vascular bundles or veins of the leaf and are continuous throughout the leaf-stalk and stem with the root by which water is absorbed from the soil. The palisade layers of the mesophyll contain the larger number of chlorophyll grains (or cupules) while the absorption of carbon dioxide is carried on chiefly through the lower epidermis which is generally much richer in stomata. The water taken up by the root from the soil contains nitrogenous and mineral salts which combine with the first product of photo-synthesis—a carbohydrate—to form more complicated nitrogen-containing food substances of a protod diet nature; these are then distributed by other elements of the vascular bundles (the phloem) through the leaf to the stem and so throughout the plant to wherever growth or development is going on. A large proportion of the water which ascends to the leaf acts merely as a carrier for the other raw food materials and is got rid of from the leaf in the form of water vapour through the stomata—this process is known as transpiration. Hence the extended surface of the leaf exposing a large area to light and air is eminently adapted for the carrying out of the process of photo-synthesis and transpiration. The arrangement of the leaf-stalk and of the terminal branches (see Phyllotaxy, below) is such as to prevent the upper leaves shading the lower, and the shape of the leaf serves towards the same end—the disposition of leaves on a branch or stem is often seen to form a “mosaic,” each leaf fitting into the space between neighbouring leaves and the branch on which they are borne without overlapping.

Submerged leaves, or leaves which are developed under water, differ in structure from aerial leaves. They have usually no fibro-vascular system, but consist of a congeries of cells, which sometimes become elongated and compressed so as to resemble veins. They have a layer of compact cells on their surface, but no true epidermis, and no stomata. Their internal structure consists of cells, disposed irregularly, and sometimes leaving spaces which are filled with air for the purpose of floating the leaf. When exposed to the air these leaves easily part with their moisture, and become shrivelled and dry. In some cases there is only a network of filament-like cells, the spaces between which are not filled with parenchyma, giving a skeleton appearance to the leaf, as in Oxyura angustifolia (Lettuce plant).

A leaf, whether aerial or submerged, generally consists of a flat expanded portion, called the blade, or lamina, of a narrower portion called the petiole or stalk, and sometimes of a portion at the base of the petiole, which forms a sheath or vagina (fig. 5, s), or is developed in the form of outgrowths, called stipules (fig. 24, s). All these portions are not always present. The sheathing or stipular portion is frequently wanting. When a leaf has a distinct stalk it is petiolate; when it has none, it is sessile, and if in this case it embraces the stem it is said to be amplexicaul. The part of the leaf next the petiole or the axis is the base, while the opposite extremity is the apex. The leaf is usually flattened and expanded horizontally, i.e. at right angles to the longitudinal axis of the shoot, so that the upper face is directed towards the heavens, and the lower towards the earth. In some cases leaves, as in Iris, or leaf-like petioles, as in Australian acacias and eucalypti, have their plane of expansion parallel to the axis of the shoot, there is then no distinction into an upper and a lower face, but the two sides are developed alike; or the leaf may have a cylindrical or polygonal form, as in mesembryanthemum. The upper angle formed between the leaf and the stem is called its axil; it is there that leaf-buds are normally developed. The leaf is sometimes articulated with the stem, and when it falls off a scar remains; at other times it is continuous with it, and then decays, while still attached to the axis. In their early state all leaves are continuous with the stem, and it is only in their after growth that articulations are formed. When leaves fall off annually they are called deciduous; while when they remain for two or more years they are persistent, and the plant is evergreen. The laminar portion of a leaf is occasionally articulated with the petiole, as in the orange, and a joint at times exists between the vaginal or stipular portion and the petiole.

The arrangement of the fibro-vascular system in the lamina consists of the formation of vascular bundle and sheathing. Some leaves, as that of the elm, there is observed a large central vein running from the base to the apex of the leaf, this is the midrib (fig. 3); it gives off veins laterally (primary veins). A leaf with only a single midrib is said to be unicusulate and the venation is described as pinnate or feather-veined. In some cases, as sycamore or castor oil (fig. 4), in place of there being only a single midrib there are several large veins (ribs) of nearly equal size, which diverge from the point where the blade joins the petiole or stem, giving off lateral veins. The leaf in this case is multicusulate and the venation palmate. The primary veins give off secondary veins, and these in their turn give off tertiary veins, and so on until a complete network of vessels is produced, and those veins usually project on the under surface of the leaf. To a distribution of vessels such as this the name of reticulated or netted venation has been applied. In the leaves of some plants there exists a midrib with large veins running nearly parallel to it from the base to the apex of the lamina, as in grasses (fig. 5); or with veins diverging from the base of the lamina in more or less
parallel lines, as in fan palms (fig. 6), or with veins coming off from it throughout its whole course, and running parallel to each other in a straight or curved direction towards the margin of the leaf, as in plantain and banana. In these cases the veins are often united by cross veins, which do not, however, form an angular network. Such leaves are said to be parallel-veined. The leaves of Monocotyledons have generally this kind of venation, while reticulated venation most usually occurs amongst Dicotyledons. Some plants, which in most points of their structure are monocotyledonous, yet have reticulated venation; as in Smilax and Dioscorea. In vascular acotyledonous plants, there is frequently a tendency to fork exhibited by the fibro-vascular bundles in the leaf; and when this is the case we have fork-veined leaves. This is well seen in many ferns. The distribution of the system of vessels in the leaf is usually easily traced, but in the case of succulent plants, as Hoya, agave, stonecrop and mesembryanthemum, the veins are obscure. The function of the veins which consist of vessels and fibres is to form a rigid framework for the leaf and to conduct liquids. In all plants, except Thallophytes, leaves are present at some period of their existence. In Cuscuta (Dodder) (q.v.), however, we have an exception. The forms assumed by leaves vary much, not only in different plants, but in the same plant. It is only amongst the lower classes of plants—Mosses, Characeae, &c.—that all the leaves on a plant are similar. As we pass up the scale of plant life we find them becoming more and more variable. The structures in ordinary language designated as leaves are considered so par excellence, and they are frequently spoken of as foliage leaves. In relation to their production on the stem we may observe that when they are small they are always produced in great number, and as they increase in size their number diminishes correspondingly. The cellular process from the axis which develops into a leaf is simple and undivided; it rarely remains so, but in progress of growth becomes segmented in various ways, either longitudinally or laterally, or in both ways. By longitudinal segmentation we have a leaf formed consisting of sheath, stalk and blade; or one or other of these may be absent, and thus stalked, sessile, sheathing, &c., leaves are produced. Lateral segmentation affects the lamina, producing indentations, lobings or fissuring of its margins. In this way two marked forms of leaf are produced—(1) Simple form, in which the segmentation, however deeply it extends into the lamina, does not separate portions of the lamina which become articulated with the midrib or petiole: and (2) Compound form, where portions of the lamina are separated as detached leaves, which become articulated with the midrib or petiole. In both simple and compound leaves, according to the amount of segmentation and the mode of development of the parenchyma and direction of the fibro-vascular bundles, many forms are produced.

Simple Leaves.—When the parenchyma is developed symmetrically on each side of the midrib or stalk, the leaf is equal; if otherwise, the leaf is unequal or oblique (fig. 3). If the margins are even and present no divisions, the leaf is entire (fig. 7); if there are slight projections which are more or less pointed, the leaf is dentate or toothed; when the projections lie regularly over each other, like the teeth of a saw, the leaf is serrate (fig. 3): when they are rounded the leaf is crenate. If the divisions extend more deeply into the lamina than the margin, the leaf receives different names according to the nature of the segments; thus, when the divisions extend about half-way down (fig. 8), it is cleft; when the divisions extend nearly to the base or to the midrib the leaf is parted.

If these divisions take place in a simple feather-veined leaf it becomes either pinnatifid (fig. 9), when the segments extend to about the middle, or pinnatisparte, when the divisions extend nearly to the midrib. These primary divisions may be again subdivided in a similar manner, and thus a feather-veined leaf will become bi-pinnatifid or bi-pinnatisparte; still further subdivisions give origin to tripinnatifid and laciniate leaves. The same kinds of divisions taking place in a simple leaf with palmate or radiating venation, give origin to lobed, cleft and parted forms. The name palmate or palmatisparte (fig. 4) is the general term applied to leaves with radiating venation, in which there are several lobes united by a broad expansion of parenchyma, like the palm of the hand, as in the sycamore, castor-oil plant, &c. The divisions of leaves with radiating venation may extend to near the base of the leaf, and the names bipartite, tripartite, quinquepartite, &c., are given according as the partitions are two, three, five or more. The term dissected is applied to leaves with radiating venation, having numerous narrow divisions, as in Geranium dissecutum.

When in a radiating leaf there are three primary partitions, and the two lateral lobes again cleft, as in hellebore (fig. 11), the leaf is called pedate or pedatisparte, from a fancied resemblance to the claw of a bird. In all the instances already alluded to the leaves have been considered as flat expansions, in which the ribs or veins spread out on the same plane with the stalk. In some cases, however, the veins spread at right angles to the stalk, forming a peltate leaf as in Indian cress (fig. 12).

The form of the leaf shows a very great variety ranging from the narrow linear form with parallel sides, as in grasses or the needle-like leaves of pines and firs to more or less rounded or orbicular—descriptions of these will be found in works on descriptive botany—a few
examples are illustrated here (figs. 7, 13, 14, 15). The apex also varies considerably, being rounded, or obtuse, sharp or acute (fig. 7), notched (fig. 15), &c. Similarly the shape of the base may vary, when rounded lobes are formed, as in dog-violet, the leaf is cordate or heart-shaped; or kidney-shaped or reniform (fig. 16), when the apex is rounded as in ground ivy. When the lobes are prolonged downwards and are acute, the leaf is sagittate (fig. 17); when they proceed right and left, as in Rhus, the leaf is hastate or half-heart-shaped. When a simple leaf is divided at the base into two leaf-like appendages, it is called auriculate. When the development of the parenchyma is such that it more than fills up the spaces between the veins, the margins become rusty, crispa or undulates, as in Rumex crispus and Rheum undulatum. By cultivation the cellular tissue is often much increased, giving rise to the curled leaves of greens, savoys, cresses, lettuce, &c.

Compound leaves are those in which the divisions extend to the midrib or petiole, and the separated portions become each articulated with it, and receive the name of leaflets. The midrib, or petiole, has thus the appearance of a branch with separate leaves attached to it, but it is considered properly as one leaf, because in its earliest state it arises from the axis as a single piece, and its subsequent divisions in the form of leaflets are all in one plane. The leaflets are either simple, as in fig. 19, or have stalks, called petiolules (fig. 19). Compound leaves are pinnate (fig. 19) or palmate (fig. 18) according to the arrangement of leaflets. When a pinnate leaf ends in a pair of pinnae it is equally or abruptly pinnate (pinnatifid); when there is a single terminal leaflet (fig. 19), the leaf is unequally pinnate (imparipinnate); when the leaflets or pinnae are placed alternately on either side of the midrib, and not directly opposite to each other, the leaf is alternately pinnate; and when the pinnae are of different sizes, the leaf is interrupted pinnate. When the division

palms it is 15 or 20 ft. long, and is so firm as to be used for poles or walking-sticks. In general, the petiole is more or less rounded in its form, the upper surface being flattened or grooved. Sometimes it is compressed laterally, as in the aspen, and to this peculiarity the trembling of the leaves of this tree is due. In aquatic plants the leaf-stalk is sometimes distented with air, as in Pontederia and Trapa, so as to float the leaf. At other times it is winged, and is either leafy, as in the orange (fig. 21), lemon and Diospyrus, or pitcher-like, as in Sarracenia (fig. 22). In some Australian acacias, and in some species of Oxalis and Bupleurum, the petiole is flattened in a vertical direction, the vascular bundles being in two or three rows, giving rise to the walking-sticks. The leaves of some plants the laminae or blades of the leaf are palmate or bipinnate, and are produced at the

is carried to the second degree, and the pinnae of a compound leaf are themselves pinnately compound, a leaflet being produced for each pinna.

The petiole or leaf-stalk is the part which unites the limb or blade of the leaf to the stem. It is absent in sessile leaves, and this is also the case when a sheath is present, as in grasses (fig. 5). It consists of the thinnest cellular tissue with but little amount of cellular tissue. When the vascular bundles reach the base of the lamina they separate and spread out in various ways, as already described under venation. The lower part of the petiole is often swollen (fig. 20, P), forming the pulvinus, formed of cellular tissue, the cells of which exhibit the phenomenon of irritability. In Mimosa pudica (fig. 20) a sensitiveness is located in the pulvinus which upon irritation induces a depression of the whole pinna leaf, a similar property existing in the pulvinus at the base of the leaflets which fold upwards. The petiole varies in length, being usually shorter than the lamina, but sometimes much longer. In some

Fig. 18.—Palmately compound leaf of the Horse-chestnut (Aesculus Hippocastanum).

Fig. 19.—Imparipinnate (unequally pinnate) leaf of Robinia. There are pairs of short-stalked leaflets (foliola, pinnae), and an odd one at the extremity. At the base of the leaf the spiny stipules are seen.

extremities of the phyllodes in a horizontal direction; in many instances they are not developed, and the phyllode serves the purpose of a leaf. These phyllodes, by their vertical position and their peculiar form, give a remarkable aspect to vegetation. On the same acacia there occur leaves with the petiole and lamina perfect; others having the petiole slightly expanded or winged, and the lamina imperfectly developed; and others in which there is no lamina, and the petiole becomes large and broad. Some petioles are long, slender and sensitive to contact, and function as tendrils

by means of which the plant climbs; as in the nasturtiums (Tropaeolum), elements and others; and in compound leaves the midrib and some of the leaflets may similarly be transformed into tendrils, as in the pea and vetch.

The leaf base is often developed as a sheath (vagina), which embraces the whole or part of the circumference of the stem (fig. 5). This sheath is comparatively rare in dicotyledons, but is seen in umbelliferous plants. It is much more common amongst monocotyledons. In edges the sheath forms a complete investment of the stem, whilst in grasses it is split on one side. In the latter plants there is also a membranaceous outgrowth, the ligule, at right angles to the median plane of the leaf, from the point where the sheath passes into the lamina, there being no petiole (fig. 5). In leaves in which no sheath is produced we not infrequently find small foliar organs, stipules, at the base of the petiole (fig. 24, e). The stipules are generally two in number, and they are important as supplying characters in certain natural orders. Thus they occur

Fig. 20.—Branch and leaves of the Sensitive plant (Mimosa pudica), showing the petiole in its erect state, a, and in its depressed state, b; also the leaflets closed, c, and the leaflets expanded, d. Irritability resides in the pulvinus, p.

Leaf base.
in the pea and bean family, in rosaceous plants and the family Rubiaceae. They are not common in dicotyledons with opposite leaves. Plants having stipules are called stipulate; those having none are estipulate. Stipules may be large or small, entire or divided, deciduous or persistent. They are not usually of the same nature as the ordinary foliage leaves of the plant, from which they are distinguished by their lateral position at the base of the petiole. In the pansy (fig. 24) the true leaves are stalked and crenate, while the stipules are large, sessile and pinnaled. In Lupinus Alpinus and some other plants the true pinnate leaves are abortive, the petiole forms a tendril, and the stipules alone are developed, forming the office of leaves. When stipulate leaves are opposite to each other, at the same height on the stem, it occasionally happens that the stipules on the two sides of the stem are wholly or partially, so as to form an interpetiolar or interfoliar stipule, as in members of the families of the leaf. In the development of the leaf the stipules frequently play a most important part. They begin to be formed after the origin of the leaves, but grow much more rapidly than the leaves, and in this way they arch over the young leaves and form protective chambers wherein the parts of the leaf may develop. In the figs, magnolias and on the two genera are completely envelop the young leaf-buds. The stipules are sometimes so minute as to be scarcely distinguishable without the aid of a lens, and are fugacious as to be visible only in the very young stage of the leaf. They may assume a hard and spiny character, as in Robinia Pseudacacia (fig. 19), or may be circular, as in Smilax, where each stipule is represented by a tendril. At the base of the leaflets of a compound leaf, small stipules (stipels) are occasionally produced.

Modifications. The variations in the structure and forms of leaves and leaf-stalks are produced by the increased development of cellular tissue, by the abortion or degeneration of parts, by the multiplication or repetition of parts and by adhesion. When cellular tissue is developed to a great extent, leaves become succulent and occasionally assume a crisp, curled appearance. Such changes take place naturally, but they are often increased by the art of the gardener, and the object of many horticultural operations is to increase the succulence of leaves. It is in this way that cabbages and savoys are rendered more delicate and nutritious. By a deficiency in development of parenchyma and an increase in the mechanical tissue, leaves are liable to become hardened and spineless. The leaves of barberry and of some species of Astragalus, and the leaves of the false acacia (Robinia) are spiny. To the same cause is due the spiny margin of the holly-leaf. When two lobes at the base of a leaf are prolonged beyond the stem and unite (fig. 25), the leaf is perfoliate, the stem appearing to pass through it, as in Bupeurus perfoliatus and Cholera perfoliata; when two leaves unite by their bases they become connate (fig. 27), as in Lonicera Caprifolium; and when leaves adhere to the stem, forming a sort of winged or leafy appendage, they are decurrent, as in thistles. The formation of peltate leaves has been traced to the union of the lobes of a cleft leaf. In the leaf of the Victoria regia the transformation may be traced during germination. The first leaves developed by the young plant are linear, the second are saggitate, and the third are rounded-cordate and the next are orbicular. The cleft indicating the union of the lobes remains in the large leaves.

The parts of the leaf are frequently transformed into tendrils, with the view of enabling the plants to twine round others for support. In Leguminosae, it is the stipules which are frequently modified to form tendrils, as in Lupinus Alpinus, in which the stipules function as true leaves. In Flaggellaria indica, Gloriosa superba and others, the midrib of the leaf ends in a tendril. In Smilax there are fewer stipular tendrils. The vascular bundles and cellular tissue are sometimes developed in such a way as to form a circle, with a hollow in the centre, and thus give rise to what are called fustular or hollow leaves, as in the onion, and to ascidia or pitchers. Pitchers are formed either by petioles or by laminae, and they are composed of one or more leaves. In Sarracenia (fig. 22) and Helianphora the pitcher is composed of the periphery of the leaf. In the pitcher plant, Nenpehes, the pitcher is a modification of the lamina, the petiole often plays the part of a tendril, while the leaf base is flat and leaf-like (fig. 28).

In Utricularia bladder-like sacs are formed by a modification of leaflets on the submerged leaves. In some cases the leaves are reduced to mere scales—calyptrate leaves; they are produced abundantly upon underground shoots. In parasites (Labdia, Orobanche) and in plants growing on decaying vegetable matter (saprophytes), in which no chlorophyll is formed, these scales are the only leaves produced. In Pinus the only leaves produced on the main stem and the lateral shoots are scales, the acicular leaves of the tree growing from axillary shoots. In Cocus enthes distillatoria, whorls of scales alternate with large pinnate leaves. In many plants, as already noticed, phyllodia or stipules perform the function of leaves. The production of leaf-buds from
 Leaves sometimes occur as in Bryophyllum and many plants of the order Gesneriaceae. The leaf of Venus's fly-trap (Dionaea muscipula) when cut off and placed in damp moss, with a pan of water under it and a bell-glass for a cover, has produced buds from which young plants were obtained. Some species of saxifrage and of ferns also produce buds on their leaves and fronds. In Nymphaea aquatica buds appear at the upper part of the petiole.

Leaves occupy various positions on the stem and branches, and have received different names according to their situation.

Thus leaves arising from the crown of the root, as in the primrose, are called radical; those on the stem are cauline; on flower-stalks, floral leaves (see Flower).

The first leaves developed are known as seed leaves or cotyledons.

The arrangement of the leaves on the axis and its appendages is called phylotaxis.

In their arrangement leaves follow a definite order. The points on the stem at which leaves appear are called nodes; the part of the stem between the nodes is the internode. When two leaves are produced at the same node, one on each side of the stem or axis, and at the same level, they are called opposite.

When opposite leaves are produced at right angles, or in what is called a decussate manner.

In the lowest pair one leaf is in front, the other behind, as at the back: in the second pair the leaves are placed laterally, and so on.

Fig. 29.—A stem with alternate leaves. The pairs are placed at right angles alternately, or in what is called a decussate manner.

Fig. 30.—A stem with alternate leaves, arranged in a penstichious or quincunxial manner. The sixth leaf is directly above the first, four leaves below the same leaf, and two below the second leaf. The fraction of the circumference of the stem expressing the divergence of the leaves is two-fifths.

node n; leaf 2 is separated from it by an internode m, and is placed to the right or left, while leaf 3 is situated directly above leaf 1. In this case, there are two orthostichies, and the arrangement is said to be diorthostichous. When the four leaves are placed at right angles above the first, the arrangement is tristichous. The same arrangement continues throughout the branch, so that in the latter case the seventh leaf is above the fourth, the tenth above the seventh; also the 3rd and 6th are above the 2nd, the 6th above the 3rd and so on. Between the nodes the median planes of two consecutive leaves in an alternate arrangement are their divergence; and it is expressed in fractions of the circumference of the axis which is supposed to be a circle. In a regularly-formed straight branch of this kind, the leaves from one to the other, turning always in the same direction, a spiral is described, and a certain number of leaves and of complete turns occur before reaching the leaf directly above that from which the enumeration commenced. If this number is expressed by a fraction, the numerator of which indicates the number of turns, and the denominator the number of internodes in the spiral cycle, the fraction will be found to represent the angle of divergence of the consecutive leaves on the axis. Thus, in \( \theta = \frac{360}{5} = 72^\circ \) for the case of a five-leafed species, the median plane of leaf 1 is parallel to that of leaf 5, at an angle of 72°. This is a simple example of a quincunxial arrangement, where there is an even number of leaves in the cycle. The fraction 7/3, 8/4, 9/5, etc., gives the divergence of the leaves in a decussate arrangement. In the case of the two-leaved species Rhododendron ponticum, the spiral is 4/1, i.e., one turn and

two leaves; the third leaf being placed vertically over the first, and the divergence between the first and second leaf being one-half the circumference of a circle, 360°/2 = 180°. Again, in a tristichous arrangement the number is 3, or one turn and three leaves, the angular divergence being 120°.

By this means we have a convenient mode of expressing on paper the exact position of the leaves upon the axis. And in many cases such a mode of expression is of excellent service in enabling us to understand the relations of the leaves. The divergences may also be represented diagrammatically, by drawing horizontal projections on the vertical axis, as in fig. 33. Here the outermost circle represents a section of that part of the axis bearing the lowest leaf, the innermost represents the highest. The broad dark lines represent the leaves, and they are numbered according to their age and position.

It will be seen at once that the leaves are arranged in orthostichies marked by interstices. These divide the circumference into five equal portions. But the leaves between the 1st and 2nd, and 2nd and 3rd, and 3rd and 4th, etc., are all separated at a distance from the stem which is a fraction of one-half the circumference of the axis, and this is the case with all leaves, whatever their age or position. The leaves are arranged in orthostichies, and this is indicated by the fraction 1/2, or one turn of the spiral round the internodes.
pass either from right to left or from left to right. It sometimes follows a different direction in the branches from that pursued in the stem. When it follows the same course in the stem and branches, they are homodromous; when the direction differs, they are heterodromous. In different species of the same genus the phyllotaxis frequently varies.

All modifications of leaves follow the same laws of arrangement as true leaves—fact which is of importance in a morphological point of view. In dicotyledonous plants the first leaves produced (the cotyledons) are opposite. This arrangement often continues during the life of the plant, but at other times it changes, passing into distichous and spiral forms. Some tribes of plants are distinguished by their opposite or verticillate, others by their alternate, leaves. Labiate plants have opposite leaves, while Boraginaceae have alternate leaves, and Tiliaceae usually have distichous leaves; Rubiaceae have opposite leaves. Such arrangements as \( \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \frac{1}{5} \) are common in Dicotyledons. The first of these, called a quinques, is met with in the apple, pear and cherry (fig. 32); the second, in the bay, holly, Plantago media; the third, in the cones of Picea alba (fig. 35); and the fourth in those of the silver fir.

In monocotyledonous plants there is only one seed-leaf or cotyledon, and hence the arrangement is at first alternate; and in many generally so more or less, rarely being verticillate. Such arrangements as \( \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \frac{1}{5} \) are common in Monocotyledons, as in grasses, sedges and lilies. It has been found in general that, while the number 5 occurs in the phyllotaxis of Dicotyledons, 3 is common in that of Monocotyledons.

In the axil of previously formed leaves leaf-buds arise. These leaf-buds contain the rudiments of a shoot, and consist of leaves covering a growing point. The buds of trees of temperate climates, which lie dormant during the winter, are protected by scale leaves. These scales or protective appendages of the bud consist either of different plants, but in each species they follow a regular law. The leaves in the bud are either placed simply in apposition, as in the mistletoe, or they are folded or rolled up longitudinally or laterally, giving rise to different kinds of vernation, as delineated in figs. 36 to 45, where the folded or curved lines represent the leaves, the thickened part being the midrib. The leaf taken individually is either folded longitudinally from apex to base, as in the tulip-tree, and called renate or reniform; or rolled up in a circular manner from apex to base, as in ferns (fig. 36), and called circinate; or folded laterally, conduplicate (fig. 37), as in oak; or it has several folds like a fan, plicate or plaited (fig. 38), as in vince and sycamore, and in leaves with radiating vernation, where the ribs mark the foldings; or it is rolled upon itself, involute (fig. 40), as in banana and apricot; or its edges are rolled inwards, involucate (fig. 40), as in violet; or

**Fig. 33.—Diagram of a phyllotaxis represented by the fraction \( \frac{3}{4} \).**

...
of colour is chiefly occasioned by the diminished circulation in the leaves, and the higher degree of oxidation to which their chlorophyll has been submitted.

Leaves which are articulated with the stem, as in the walnut and horse-chestnut, fall and leave a scar, while those which are continuous with it remain attached for some time after they have lost their vitality. Most of the trees of Great Britain have deciduous leaves, their duration not extending over more than a few months, while in tropical countries they remain attached to the leaf-stalk for many more years. In tropical countries, however, many trees lose their leaves in the dry season. The period of defoliation varies in different countries according to the nature of their climate. Trees which are characterized by the shedding of their leaves and evergreen, are always one or the other, the shedding of a certain number of leaves at intervals, sufficient being left, however, to preserve their green appearance. The cause of the fall of the leaf in cold climates seems to be deficiency of light and heat in winter which causes a cessation in the functions of the leaf. The fall is directly caused by the formation of a layer of tissue across the base of the leaf-stalk; the cells of this layer separate from one another and the leaf remains attached only by the fibres of the veins until it becomes finally detached by the wind or frost. Before its fall the leaf has become dry owing to loss of water and the removal of the protoplasm and food substances to the stem for use next season; the red and yellow colouring matters are products of decomposition of the chlorophyll. Inorganic and other waste matters are stored in the leaf-tissue and thus got rid of by the plant. The leaf scar is protected by a corky change (suberization) in the walls of the exposed cells.

(A. B. R.)

LEAF-INSECT, the name given to orthopterous insects of the family Phasmidae, referred to the single genus Phyllium and characterized by the presence of lateral laminae upon the legs and abdomen, which, in association with an abundance of green colour-matter, impart a broad and leaf-like appearance to the whole insect. In the female this deceptive resemblance is enhanced by the large size and foliaceous form of the front wings which, when at rest edge to edge on the abdomen, forcibly suggest in their neuration the midrib and costae of an ordinary leaf. In this sex the posterior wings are reduced and functionless so far as flight is concerned; in the male they are ample, membranous and functional, while the anterior wings are numerous and not leaf-like. The freshly hatched young are reddish in colour; but turn green after feeding for a short time upon leaves. Before death a specimen has been observed to pass through the various hues of a decaying leaf, and the spectrum of the green colouring matter does not differ from that of the chlorophyll of living leaves. Since leaf-insects are purely vegetable feeders and not predaceous like mantids, it is probable that their resemblance to leaves is solely for purposes of concealment from enemies. Their egg capsules are similarly protected by their likeness to various seeds. Leaf-insects range from India to the Seychelles on the one side, and to the Fiji Islands on the other.

(LEAGUE. r. (Through Fr. ligue, It. liga, from Lat. ligare, to bind), an agreement entered into by two or more parties for mutual protection or joint attack, or for the furtherance of some common object, also the body thus formed. (R. P. I.)

League has been given to numerous confederations, such as the Achaean League (q.v.), the confederation of the ancient cities of Achaia, and especially to the various holy leagues (ligues saintes), of which the better known are those formed by Pope Julius II, against Venice in 1508, often known as the League of Cambrai, and against France in 1511. “The League,” in French history, is that of the Catholics headed by the Guises to preserve the Catholic religion against the Huguenots and prevent the accession of Henry of Navarre to the throne (see FRANCE: History). “The Solemn League and Covenant” was the agreement for the establishment of Presbyterianism in both countries entered into by England and Scotland in 1643 (see COVENANTERS). Of commercial leagues the most famous is that of the Hanse towns, known as the Hanseatic League (q.v.). The word has been adopted by political associations, such as the Anti-Slavery League, the Irish Land League, the Primrose League and the United Irish League, and by social organizations. “League” has also been applied to a special form of competition in athletics, especially in Association football. In this system clubs “league” together in a competition, each playing every other member of the association twice, and the order of merit is decided by the points gained during the season, a win counting two and a draw one.

2. (From the late Lat. lenge, or lege, said to be a Gallic word; the mod. Fr. ièue comes from the O. Fr. line; the Gaelic leac, meaning a flat stone posted as a mark of distance on a road, has been suggested as the origin), a measure of distance, probably never in regular use in England, and now only in poetical or rhetorical language. It was the Celtic as opposed to the Teutonic unit, and was used in France, Spain, Portugal and Italy. In all the countries it varies with different localities, and the ancient distance has never been fixed. The kilometric league of France is fixed at four kilometres. The nautical league is equal to three nautical miles.

LEAKE, WILLIAM MARTIN (1777-1860), British antiquarian and topographer, was born in London on the 14th of January 1777. After completing his education at the Royal Military Academy, Woolwich, and spending four years in the West Indies as lieutenant of marine artillery, he was sent by the government to Constantinople to instruct the Turks in this branch of the service. A journey through Asia Minor in 1800 to join the British fleet at Cyprus inspired him with an interest in antiquarian topography. In 1801, after travelling across the desert with the Turkish army to Egypt, he was, on the expulsion of the French, employed in surveying the valley of the Nile as far as the cataracts; but having sailed with the ship engaged to convey the Elgin marbles from Athens to England, he lost all his maps and observations when the vessel foundered off Cerigo. Shortly after his arrival in England he was sent out to survey the coast of Albania and the Morea, with the view of assisting the Turks against attacks of the French from Italy, and of this he took advantage to form a valuable collection of coins and inscriptions and to explore ancient sites. In 1807, war having broken out between Turkey and England, he was made prisoner at Salonica; but, obtaining his release the same year, he was sent out to survey the country and to examine the monuments in the vicinity of Constantinople. The results of his travels were published in the following volumes: Topography of Athens (1821); Journal of a Tour in Asia Minor (1824); Travels in the Morea (1830), and a supplement, Peloponnésia (1836); Travels in Northern Greece (1833); and Numismata Hellenica (1854), followed by a supplement in 1859. A characteristic of the researches of Leake was their comprehensive minuteness, which was greatly aided by his mastery of technical details. His Topography of Athens, the first attempt at a scientific treatment of the subject, is still authoritative in regard to many important points (see ATHENS). He died at Brighton on the 6th of January 1860. The marbles collected by him in Greece were presented to the British Museum; his bronzes, vases, gems and coins were purchased by the university of Cambridge after his death, and are now in the Fitzwilliam Museum. He was elected F.R.S. and F.R.G.S., received the honorary D.C.L. at Oxford (1816), and was a member of the Berlin Academy of Sciences and correspondent of the Institute of France.

See Memoir by J. H. Marsden (1864); the Architect for the 7th of October 1876; E. Curtius in the Preussische Jahrbücher (Sept., 1876); J. E. Sandys, Hist. of Classical Scholarship, iii. (1908), p. 442.

LEAMINGTON, a municipal borough and health resort of Warwickshire, England, on the river Leam near its junction with the Avon, 98 m. N.W. from London, served by the Great Western and London & North Western railways. Pop. (1901) 26,888. The parliamentary boroughs of Leamington and Warwick were joined into one constituency in 1885, returned two members. The centre of the towns are 2 m. apart, Warwick lying to the west, but they are united by the intermediate parish of New Milverton. There are three saline springs, and the principal pump-rooms, baths and pleasant gardens lie on the right bank of the river. The chief public
LEANDRE—LEATHER

330

buildings are the town hall (1834), containing a free library and school of art; and the Theatre Royal and assembly room. The parish church of All Saints is modernized, and the other churches are entirely modern. The S. Warwickshire hospital and Midland Counties Home for incurables are here. Leamington High School is an important school for girls. There is a municipal technical school. Industries include iron foundries and brickworks. The town lies in a well-watered and picturesque country, within a few miles of such interesting towns as Warwick, Kenilworth, Coventry and Stratford-on-Avon. It is a favourite hunting centre, and, as a health resort, attracts not only visitors but residents. The town is governed by a mayor, 8 aldermen, and 24 councillors. Area, 2817 acres.

Leamington was a village of no importance until about 1786, when its prosperity began, the springs were noticed by Camden, writing about 1656. The population in 1811 was only 543. The town was incorporated in 1875. The name in former use was Leamington Priors, in distinction from Leamington Hastings, a village on the upper Leam. By royal licence granted in 1838 it was called Royal Leamington Spa.

LEANDRE, CHARLES LUCIEN (1826- ), French caricaturist and painter, was born at Champsecret (Orne), and studied painting under Bin and Cabanel. From 1857 he figured among the exhibitors of the Salon, where he showed numerous portraits and genre pictures, but his popular fame is due to his comic drawings and caricatures. The series of the "Gotha des souverains," published in Le Rire, placed him in the front rank of modern caricaturists. Besides his contributions to Le Rire, Le Figaro and other comic journals, he published a series of albums: Nocturnes, Le Musee des souverains, and Paris et la province. Leandre produced admirable work in lithography, and designed many memorable posters, such as the "Yvette Guilbert." "Les nouveaux mariés," "Joseph Frudhomme," "Les Lutteurs," and "La Femme au chien." He was created a knight of the Legion of Honour.

LEAP-YEAR (more properly known as bissextile), the name given to the year containing 366 days. The astronomers of Julius Caesar, 46 B.C., settled the solar year at 365 days 6 hours. These hours were set aside and at the end of four years made a day which was added to the fourth year. The English name for the bissextile year is an allusion to the result of the interposition of the extra day; for after the 29th of February a date "leaps over" the day of the week on which it would fall in ordinary years. Thus a birthday on the 10th of June, a Monday, will in the next year, if a leap-year, be on the 10th of June, a Wednesday. Of the origin of the custom for women to woo, not be wooed, during leap-year no satisfactory explanation has ever been offered. In 1288 a law was enacted in Scotland that "it is statute and ordinance that during the rein of his maist bllissit Meg annex, for ilk yeares knowne as yeperye, ilk mayden lacy of bothe the highe and lowe estait shall haue libertie to bespeke ye man she likes, albeit he refuses to tike hir to be his lawful wyfe, he shall be mulcted in ye sume ane pundis or less, as his estait may be; except and asis gif he can make it appeare that he is betrothit ane ither woman he then shall be free." A few years later a like law was passed in France, and in the 17th century the custom was legalized in Genoa and Florence.

LEAN, EDWARD (1812-1888), English artist and humorist, was born in London on the 12th of May 1812. His earliest drawings were ornithological. When he was twenty years old he published a brilliantly coloured selection of the rarer Pittaiceae. His power attracted the attention of the 13th Earl of Derby, who employed Lean to draw his Knowsley menagerie. He became a permanent favourite with the Stanley family; and Edward, 13th Earl, was the child for whose amusement the first Book of Nonsense was composed. From birds Lean turned to landscape, his earlier efforts in which recall the manner of J. D. Harding, but he quickly acquired a more individual style. About 1837 he set up a studio at Rome, where he lived for ten years, with summer tours in Italy and Sicily, and occasional visits to England. During this period he began to publish his Illustrated Journals of a Landscape Painter: charmingly written reminiscences of wandering, which ultimately embraced Calabria, the Abruzzi, Albania, Corsica, &c. From 1848-1849 he explored Greece, Constantinople, the Ionian Islands, Lower Egypt, the wildest recesses of Albania, and the desert of Sinai. He returned to London, but the climate did not suit him. In 1854-1855 he wintered on the Nile, and migrated successively to Corfu, Malta and Rome, finally building himself a villa at San Remo. From Corfu Lean visited Mount Athos, Syria, Palestine, and Petra; and when over sixty, by the assistance of Lord Northbrook, then Governor-General, he saw the cities and scenery of greatest interest within a large area of India. From first to last he was, in whatever circumstances of difficulty or ill-health, an indomitable traveller. Before visiting new lands he studied their geography and literature, and then went straight for the mark: and wherever he went he drew most indefatigably and most accurately. His sketches are not only the basis of more finished works, but an exhaustive record in themselves. Some defect of technique or eyesight occasionally left his larger oil painting, though more composed, crude or deficient in harmony; but his smaller pictures and more elaborate sketches abound in beauty, delicacy, and truth. Lean modestly called himself a topographical artist; but he included in the term the perfect rendering of all characteristic graces of form, colour, and atmosphere. The last task he set himself was to prepare for popular circulation a set of some 200 drawings, illustrating from his travels the scenic touches of Tennyson's poetry; but he did not live to complete the scheme, dying at San Remo on the 30th of January 1888. Until sobered by age, his conversation was brimful of humorous fun. The paradoxical originality and ostentatiously uneducated draughtsmanship of his numerous nonsense books won him a more universal fame than his serious work. He had a true artist's sympathy with art under all forms, and might have become a skilled musician had he not been a painter. Swainson, the naturalist, praised young Lean's great red and yellow macaws as "equaling any figure ever painted by Audubon in grace of design, perspective, and anatomical accuracy." Murchison, examining his sketches, complimented them as rigorously embodying geological truth. Tennyson's lines "To E.L. on his Travels in Greece," mark the poet's genuine admiration of a cognate spirit in classical art. Ruskin placed the Book of Nonsense first in the list of a hundred delectable volumes of contemporary literature, a judgment endorsed by English-speaking children all over the world.

See Letters of Edward Lear to Chickister Fortescue, Lord Cartingford, and Frances, Countess Waddington (1897), edited by Lady Strachey, with an introduction by Henry Strachey. (F. L.)

LEASE (derived through the Fr. from the Lat. lasser, to loosen), a certain form of tenure, or the contract embodying it, of land, houses, &c.; see LANDLORD AND TENANT.

LEATHER (a word which appears in all Teutonic languages; cf. Ger. Leder, Dutch leer or leder, Swed. läder, and in such Celtic forms as Welsh iâder), an imputrescible substance prepared from the hides or skins of living creatures, both cold and warm blooded, by chemical and mechanical treatment. Skins in the raw and natural moist state are readily putrefiable, and are easily disintegrated by bacterial or chemical action, and if dried in this condition become harsh, horny and intractable. The art of the leather manufacturer is principally directed to overcoming the tendency to putrefaction, securing suppleness in the material, rendering it impervious to and unalterable by water, and increasing the strength of the skin and its power to resist wear and tear. Leather is made by three processes or with three classes of substances. Thus we have (1) tanned leather, in which the hides and skins are combined with tannin or tannic acid; (2) tawed leather, in which the skins are prepared with mineral salts; (3) chromised (or chromium) leather, in which the skins are rendered imputrescible by treatment with oils and fats, the decomposition products of which are the actual tanning agents.

Sources and Qualities of Hides and Skins.—The hides used in heavy leather manufacture may be divided into three classes: (1) ox and heifer, (2) cow, (3) bull. Oxen and heifer hides produce the best results, forming a tough, tight, solid leather. Cow hides are thin, the hide itself
being fibrous, but still compact, and by reason of its spread or area is used chiefly for dressing purposes in the bag and portman-tuau manufacture and work of a similar description. Bull hides are fibrous; they are largely used for heel lifts, and for cheap belts; the thicker hides being used in the iron and steel industry.

A second classification now presents itself, viz. the British home supply, continental (Europe), British colonial, South American, East Indian, Chinese, &c.

In the British home supply there are three chief breeds: (1) Shorthorns (Scotch breed), (2) Herefords (Midland breed), (3) Lowland, or Dutch class. From a tanner's standpoint, the shorthorns are the best hides procurable. The cattle are exposed to a variable climate in the mountainous districts of Scotland, and nature, adapting herself to circumstances, provides them with a thicker and more compact hide; they are well grown, have short necks and small heads. The Hereford class are probably the best English hide; they likewise have small heads and horns, and produce good solid sole leather. The Lowland hides come chiefly from Suffolk, Kent and Surrey; the animals have long legs, deep necks, and long heads. The hides are usually thick and spready. The hides of the animals killed for the Christmas season are poor. The animals being stall-fed for the beef, the hides become distended, thin and surcharged with fat, which renders them unsuitable for first-class work.

The continental supply may be divided into two classes: (1) Hides from hilly regions, (2) hides from lowlands. All animals subject to strong winds and a wide range of temperatures have a very strong hide, and for this reason those bred in hilly and mountainous districts are best. The hides coming under heading No. 1 are of this class, and include those from the Swiss and Italian Alps, Bavarian Highlands and Pyrenees, also Florence, Oporto and Lisbon hides. They are magnificent hides, thick, tightly-built, and of smooth grain. The butt is long and the legs short. A serious defect in some of these hides is a thick place on the neck caused by the yoke; this part of the hide is absolute waste. Another defect, specially noticeable in Lisbon and Oporto hides, is good marks on the rump, barred wire scratches and warbles, caused by the gadfly. Those hides coming under heading No. 2 are Dutch, Rhine valley, Danish, Swedish, Norwegian, Hungarian, &c. The first three hides are very similar; they are spready, poorly grown, and are best used for bag and portman-tauw work. Hungarian oxen are immense animals, and supply a very heavy bend. Swedish and Norwegian hides are evenly grown and of good texture; they are well flayed, and used a great deal for manufacturing picker bands, which require an even leather.

New Zealand, Australian and Queensland hides resemble good English. A small quantity of Canadian steers are imported; these are generally branded.

Chinese hides are exported dry, and they have generally suffered more or less from peptonization in the storing and drying; this cannot be detected until they are in the pits, when they fall to pieces.

A large amount is imported as live-stock, and are killed within forty-eight hours. They come to Hull, Birkenhead, Avonmouth and Deptford from various American ports, and usually give a flatter result than English, the general quality depending largely on whether the ship has had a good voyage or not. Among South American hides, Liebig’s supply the best; they are thoroughly clean and carefully trimmed and flayed. They come to London, Antwerp and Havre, and except for being branded are of first-class quality. Second to the Liebig supply come the Uruguay hides.

East Indian hides are known as kips, and are supposed to be, and should be, the hides of yearling cattle. They are now dressed to a large extent in imitation of box calf, being much cheaper. They come from a small breed of ox, and have an extremely tight grain; the leather is not so soft as calf.

Calf-skins are largely supplied by the continent. They are soft and pliant, and have a characteristic fine grain, are tight in texture and quite apart from any other kind of skin.

The most valuable part of a sheep-skin is the wool, and the value of the pelt is inversely as the value of the wool. Pure Leicester and Norfolk woods are very valuable, and next is the North and South Downs, but the skins, i.e. the pelts, of these animals are extremely poor. Devon and Cheviot cross-bred sheep supply a fair pelt, and sometimes these sheep are so many times crossed that it is quite impossible to tell what the skin is. Welsh skins also supply a good tough pelt, though small. Indian and Persian sheep-skins are very goaty, the hcdls being allowed to roam about together so much. The sheep-skin is the most porous and open-textured skin in existence, as also the most greasy one; it is flabby and soft, with a tight, compact grain, but an extremely loose flesh. Still-born lambs and lambs not over a month old are worth much more than when they have lived for three months; they are used for the manufacture of best kid gloves, and must be milk skins. Once the lambs have taken to grass the skins supply a harsher leather.

The best goat-skins come from the Saxon and Bavarian Highlands, Swiss Alps, Pyrenees, Turkey, Bosnia, Southern Hungary, and the Urals. The goats being exposed to all winds, yield fine skins. A good number come from Argentina and from Abyssinia, the Cape and other parts of Africa. Of all light leathers the goat has the toughest and tightest grain; it is therefore, especially liked for fancy work. The grain is rather too bold for glazed work, for which the sheep is largely used.

The seal-skin, used largely for leant work, is the skin of the yellow-seal, found in the Northern seas, the Baltic, Norway and Sweden, &c. The skin has a large, bold, brilliant grain, and being a large skin is much used for upholstery and coach work, like the Cape goat. It is quite distinct from the fur seal.

Porpoise hide is really the hide of the white whale; it is dressed for shooting, fishing and hunting leats. Horse hide is dressed for light split and upper work; being so much stiff-fed it supplies only a thin, spready leather. The skins of other Equidae, such as the ass, zebra, quagga, &c. are also dressed to some small extent, but are not important sources.

Structure of Skin.—Upon superficial inspection, the hides and skins of all mammals appear to be unlike each other in general configuration. Upon closer examination, it is found that the anatomical structure of most skins is so similar that for all practical purposes we may assume that there is no distinction (see SKIN and EXOSKELETON). But from the practical point of view, as opposed to the theoretical, there are three forms, and a variety of intermediate forms, such as those of texture, thickness, area, &c.; and these differences cause a great diversity in the methods of tanning used, almost necessitating a distinct tannage for nearly every class of hide or skin.

The skins of the lower animals, such as alligators, lizards, fish and snakes, differ to a large extent from those of the mammals, chiefly in the epidermis, which is much more horny in structure and function.

The skin is divided into two distinct layers: (1) the epidermis or epithelium, i.e. the cuticle, (2) the corium derma, or cutis, i.e. the true skin. These two layers are not only different in structure, but also of entirely distinct origin. The epidermis again divides itself into two parts, viz. the "horny layer" or surface skin, and the rete Malpighii, named after the Italian anatomist who first drew attention to its existence. The rete Malpighii is composed of living, soft, nucleated cells, which multiply by division, and, as they increase, are gradually pushed to the surface of the skin, becoming flatter and drier as they near it, until they reach the surface as dried scales. The epidermis is thus of cellular structure, and more of the horn—owing to the equation of the epi-dermis. It is of cellular structure, and the fibrous part is composed of long needle-shaped cells which contain the pigment with which the hair is coloured. Upon removal of the hair some of these cells remain behind and colour the skin, and this colour does not fade until the skin has been exposed to the sun for a long time. Each hair is supplied with at least two or three glands, which discharge into the orifice of the hair shaft; these glands impart to the hair that natural glossy appearance which is characteristic of good health. The hair bulb (fig. 1) consists of living nucleated cells, which multiply rapidly, and, like the rete Malpighii, cause an upward pressure, getting harder at the same time, thereby lengthening the hair.
The hair papilla (a, fig. 1) consists of a globule of the corium or true skin embedded in the hair bulb, which is surrounded by blood-vessels and nourishes the hair. Connected with the lower part of each hair is an oblique muscle known as the arrector or erector pili, seen at k & l, fig. 1; this is an involution of muscle contracted by sudden cold, heat or shock, with an accompanying tightening of the skin, producing the phenomenon commonly known as goose flesh. This is the outcome of the contracted muscle pulling on the base of the hair, thereby giving rise to the approach of the vertical, and producing the simultaneous effect of making the hair stand on end.

The sublustrous or sweat glands (R, fig. 1) consist of long spiral canaliculi, formed from the fibres of the dense tissue of the corium. These discharge sometimes directly through the epidermis, but more often into the orifice of the hair-sheath.

The epidermis is separated from the corium by a very important stratum of fine membranes, termed the 'hyaline' layer, to which constitutes the actual grain surface of a hide or skin. This layer is chemically different from the corium, as it is torn or scratched during the process of tanning the colour of the underlying parts is much lighter than that of the grain surface.

The corium, unlike the epidermis, is of fibrous, not cellular structure; moreover, the fibres do not multiply among themselves, but are gradually developed as needed from the interfibrillar substance, a semi-soluble gelatinous modification of the true fibre. This interfibrillar substance consequently has no structure, and cannot receive a cuticular appearance, at any time on coming into contact with tannin to form amorphous gelatinous bodies, which fills what would in the absence of this substance be interfibrillar spaces. The more of this matter there is present the more completely will the spaces be filled, and the more waterproof will be the leather. An old bull, as is well known, supplies a very poor, soft and spongy leather, simply because the interfibrillar substance, which has been sapped up by the hyaline layer, are, therefore, separated by interfibrillar spaces, which on coming in contact with tannin absorb it with avidity by capillary attraction. But a newer hide or young calf supplies the most tight and waterproof leather known, because, as soon as nourishment do not require to draw upon and sap the interfibrillar substance with which the skin is full to overflowing.

The corium obtains its food from the body by means of lymph ducts, with which it is well supplied. It is also provided with nodules of lymph to nourish the hair, and nodules of grease, which increase in number as they near the flesh side, until the net, subcuticular greasing, or that which separates the corium from meat proper, is quite full with them.

The corium is coarse in the centre of the skin where the fibres, which are of the kind known as white connective tissue, and which exist in bundles bound together with yellow elastic fibres are loosely woven, but towards the flesh side they become more compact, and as the hyaline layer is near the bundles of fibres finer and finer, and are much more tightly interwoven, until finally, near the grain itself, the fibres no longer exist as individual fibres lying parallel with the grain. This layer is known as the pars papillaris. The bundles of fibre interweave one another in every conceivable direction. The fibres are extremely minute, and are connected together with a medium rather more soluble than themselves.

There are only two exceptions to this general structure which need be taken into account. Sheep-skin is essentially loosely woven in the centre, so much so that any lacklessness in the wet work or sweating process enables one to split the skin in two by tearing.
peculiar material, and may be completely washed out of a leather tanned with it. It mellows exceedingly, and keeps the leather fibre open; it may be said that it only goes in the leather to prepare and make easy the way for other tannins. Block gambier contains from 35% to 40% and cube gambier from 50% to 65% of tannin.

Hemlock generally reaches the market as extract, prepared from the bark of the American tree. It contains about 22% of tannin, has a pine-like odour, but yields a rather dark-coloured red leather. Quebracho, on the market in March, containing 50% to 70% of tannin; it is a harsh, light-red tannin, but darkens rapidly on exposure to light. It is used for refreshing up very mellow leathers, but is rather wasteful, as it deposits an enormous amount of its tannin as phosphates.

Mangrove or cutch is a solid extract, prepared from the mangrove tree found in the swamps of Borneo and the Straits Settlements; it contains upwards of 60% of a red tannin.

Mimoso is the bark of the Australian golden wattle (Acacia pycnantha). It contains about 30% of tannin, is a rather harsh tannage, yielding a yellowish-red colour, and is useful for sharpening liquors. This bark is now successfully cultivated in Australia. The tannin content of this Natal bark is somewhat inferior, but the colour is superior to the Australian grade.

Larch bark contains 9% to 10% of light-coloured tannin, and is used especially for tanning Scotch basils.

Canaigue is the air-dried tuberous roots of a Mexican plant, containing 40% of tannin, and the tannage yields an orange-coloured leather of considerable weight and firmness. Its cultivation did not pay well enough, so that it is little used.

Cutch, catechu or "dark catechu," is obtained from the wood of Indian acacias, and is not to be confused with mangrove cutch. It contains 60% of tannin matter and a large proportion of catechin similar to that contained in gambier, but much redder. It is used for treating leather which should not contain much black, and which could not be coloured with a firm, tough product. With this end in view he dusts his hides with this fresh material in the layers, i.e. it spreads a layer between each hide as it is laid down, so that the strong liquids penetrate and deposit in the hides. When most of the power to deposit has been usefully utilized in the layers, then the material (which is now, perhaps, half spent) is leached. The light-leather maker does not want a hard, firm leather, but a soft and pliable product; hence he leaches his material fresh, and does not trouble as to whether the tannin deposits in the pits or not.

The tannage of all these woods is carried out in the same way. There are several methods in vogue; the best method only will be described, viz. the "press leach" system. As usual, the leaching is carried out in a series of six square pits, each holding about 3 to 4 tons of material. The method depends upon the fact that when a weak liquor is forced over a stronger one they do not mix, by reason of the higher specific gravity of the stronger liquor. With strong liquor in the pit, and weaker liquor downwards, and as the pit in which it is contained is fitted with a false bottom and side duct running over into the next pit, the stronger liquor is forced upwards through this duct on to the lower liquor and is rejected; only the part of the weak liquor or water, as the case may be, is run off the last vat as a very strong infusion. As a concrete example let us take the six pits shown in the figure.

---

1 See Lye.
depend mostly upon one or other of two processes; either the precipitation of the tannin by means of gelatin, or its absorption by means of prepared hide. Sir Humphry Davy was the first to propose a method for analysing tanning materials, and he precipitated the tannins by the use of ammonia; but this was found to be tedious and difficult to work and could not be regarded as a great advance. Wagner then proposed precipitation by means of the alkaloids, with special regard to cinchonine sulphate in the presence of rosin. This method was improved by Stoddart, and is now regarded as the best. After this many metallic precipitants were tried, used gravimetrically and volumetrically, but without success. The weighing of precipitated tannates will never succeed, because the tannates are such very faint substances. The precipitate may contain different quantities of the precipitant, and some materials contain two or three different tannins. Then there are also the difficulties of incomplete precipitation and the precipitation of colouring matters, etc. Among this class of methods may be mentioned Garland's, in which tannic emetic and sal ammoniac were employed. It was improved by Richards and Derham.

Another class of methods depends upon the destruction of the tannin by some oxidizing agent, and the estimation of the amount required. Terrell rendered the tannin alkaline, and after agitating it with a known quantity of air, estimated the volume of oxygen absorbed. The method was slow and subject to many sources of error. The method of estimating iodine with iodine is a method that estimated the excess of iodate. This process also was troublesome, besides oxidizing the gallic acid (as do all the oxidation processes), and entailing a separate estimation of them after the removal of the tannate. Monier proposed permanganate as an oxidizing agent, and used the method of weighing the tannin by adding indigo solution to the tannin solution, which controlled the oxidation and acted as an indicator. This method also required double titration because of the gallic acid present, the tannate may be being removed from solution by means of gelatin and acidified salt.

The indirect gravimetric hide-powder method first took form about 1886. It was published in Der Gerber by Simand and Weiss, other names being mentioned, and in 1887, W. H. Ranspacher did some earlier work on similar lines, depending upon the specific gravity of solutions. Professor H. R. Procter perfected this method by packing a bell, similar in shape to a bottomless bottle, packed with powder, and agitating the tan liquor through the powder and over into a receiver. This deprives the tan liquor of tannin, and a portion of this non-tannin solution is evaporated to dryness and weighed till constant; secondly, the tannin is estimated by adding a solution of sal powder, and the weight of the tannin is calculated. The weight of the non-tannins is then subtracted from the weight of the tannin and tannins, which is calculated to a constant weight. The method was adopted as the official by the International Association of Leather Trade Chemists until 1906, when its faults were vividly brought before them by Gordon Parker of London and Bennett of Leeds, working in a similar direction, although other but not so complete work had been previously done to the same extent. The main faults of the method were that the hide-powder absorbed non-tannins, and therefore registered as tannins, and the hide-powder was partially soluble. This difficulty has now been overcome to a large extent in the present official method of the I.A.L.T.C.

Meanwhile, Parker and Munro Payne proposed a new method of analysis, the essence of which is as follows:—A definite excess of lime solution to a constant quantity of tannin solution and of tannin estimated; the tan solution is now deprived of tannin by means of a soluble modification of gelatin, called "collin," and the process is repeated. Thus we get two sets of figures: firstly, the amount of tannin absorbed (i.e., acids other than the tannate), the latter subtracted from the former gives tannin absorption, and this is calculated out in percentage of original liquor. The method failed theoretically, because a definite molecule of gelatin is used with different tannins, all are different. There are also several other objections, but though, like the hide-powder method, it is quite empirical, it gives exceedingly useful results if the rules for working are strictly adhered to.

The double-acting method is a modification of the American official method, which is in turn a modification of a method proposed by W. Eitner, of the Vienna Leather Research Station. The hide-powder is very slightly chrome-tanned with a very strong solution of non-tannins, from which the hides are used per 100 grammes of hide-powder, and is then washed free from soluble salts and squeezed to contain 70% of moisture, and is ready for use. This preliminary chrome does away with the difficulty of the powder being soluble, by rendering it quite insoluble; it also lessens the tendency to absorb non-tannins. Such a quantity of this wet powder as contains 6-5 grammes of dry hide is now taken, and water is added until this quantity contains exactly 20 grammes of moisture, i.e., 26.5 grammes in all; it is then agitated for 15 minutes with 100 c.c. of the prepared tannin solution, which is then dried and weighed the precipitate, after washing free from excess of reagents. This method was improved by Stoddart, and cannot lay claim to much accuracy. Warington and Müller again proceeded to improve the method of precipitants; and in this case the I.A.L.T.C. has succeeded. The work done by Wood, Trotman, Procter, Parker and others on the alcaloidal precipitation of tannin deserves mention.

Heavy Leathers.—The hides of oxen are received in the tannery in four different conditions: (1) market or slaughter hides, which, coming direct from the local abattoirs, are soft, moist and dirty and blood; (2) wet salted hides; (3) dry salted hides; (4) sun-dried or "fini" hides—the last three forms being the condition in which the imports of foreign hides are made. The first operation in the tannery is to clean the hides and bring them back as nearly as possible to the flaccid condition in which they left the animal's back. The blood and other matter on market hides must be removed as quickly as possible, the blood being of itself a cause of dark stains and bad grain, and with the other the refuse source of putrefaction. When the hides are sound they are given perhaps two changes of water. Salted hides need a longer soaking than market hides, as it is necessary to remove all the salt from the hide, but also necessary to plump and soften the fibre which has been partially dehydrated and contracted by the salt. It must also be borne in mind that a 10% solution of salt dissolves hide substance, thereby causing undesirable loss of weight, and a weak solution of salt and plumping, especially when taken into the tans, and may also cause "bucking," which cannot easily be removed in after processes. Dried and dry salted hides require a much longer soaking than any other variety. Residues are always uncertain, as they may have putrefied before drying, and also may have been dried at too high a temperature; in the former case they fail to pieces in the tans, and in the latter case it is practically impossible to soak them back, unless putrefactive substances have been removed. Wet salted hides are putrefactive, and putrefaction is accelerated by the tannery. In treating salted goods, the first wash water should always be rapidly changed, because, as mentioned, strong putrefactive objection to hide; four changes of water should always be given to these goods.

There are other and mechanical means of softening obstinate material, viz., by stockling. The American hide mill, or double-acting stock, diagrammatically in fig. 2, is a popular piece of apparatus, but the goods should be subjected to violent mechanical treatment until soft enough to stand it, because the grain cracking may result. Perhaps the use of sodium sulphide or caustic soda in conjunction with American wash wheel is the safest method.

Whatever means are used the ultimate object is to first swell and open up the fibres as much as possible, and secondly to remove putrescent refuse or putrefaction by, for example, putrefaction or putrefaction, and if left in is fixed by the tan in the process of depliation, and causes a dirty buff.

After being thus brought as nearly as possible into a uniform condition, all hides are treated alike. The first operation to which they are subjected is depilation, which removes not only the hair but also the scar skin or epidermis. When the goods are sent to the sides for depilation they are, first of all, placed in an old lime, highly charged with organic matter and bacteria. It is the common belief that the lime causes the hair to loosen and fall out, but this is not so; in fact, pure lime has the opposite
effect of tightening the hair. The real cause of the loosening of the hair is that the bacteria in the old lime creep down the hair, enter the *rete Malpighi* and hair sheath, and attack and decompose the soft cellular structure of the sheath and bulb, also altering the composition of the *rete Malpighi* by means of which the scar skin adheres to the true skin. These products of the bacterial action are soluble in lime, and immediately dissolve, leaving the scar skin and hair unbound and in a condition to leave the skin upon scraping. In this first “green” lime the action is mainly this destructive one, but the goods have yet to be made ready to receive the tan liquor, which they must enter in a plump, open and porous condition. Consequently, the “green” lime is followed with two more, the second being less charged with bacteria, and the third, if not actually a new one, a very near approach to it; in these two limes the bundles of fibre are gradually softened, split up and distended, causing the hide to swell, the interfibular substance is rendered soluble and the whole generally made suitable for transference to the tan liquors. The hide itself is only very slightly soluble; if care is taken, the grease is transformed into some insoluble calcium soap, and the hair is partially acted upon at all.

The time the goods are in the limes and the method of making new limes depends upon the quality of the leather to be turned out. The harder and tougher the leather required the shorter and fresher the liming. For instance, for sole leather where a hard result is required, the time in the limes would be from 8 to 10 days, and a perfectly fresh top lime would be used, with the addition of sodium sulphide to hasten the process. Every tanner uses a different quantity of lime and sulphide, but a good average quantity is 7 lb per hide and 10-15 lb sodium sulphide per pit of 100 hides. The lime is slaked with water and the sulphide mixed in during the slaking; if it is added to the pit when the slaking is finished the greater part of its effect is lost, as it does not then enter into the same chemical combinations with the lime, forming polysulphides, as when it is added during the process of slaking.

For softer and more pliable leathers, such as are required for harness, the term “half” or “mellow” liming is given, and the time in the limes is increased from 9 to 12 days. Some of the old mellow liquor is added to the fresh lime in the making, so as to just take off the sharpness. It would be made up as for sole leather, but with less sulphide or none at all, and then a dozen buckets of an old lime would be added. For lighter leathers from 3 to 6 weeks’ liming is given, and a fresh lime is never used.

“Sweating” as a method of depilation is obsolete in England so far as heavy leathers are concerned. It consists of hanging the goods in a warm humid condition until putrefaction sets in. This first attacks the more mucous portions, as the *rete Malpighi*, hair bulb and sheath, and so allows the hair to be removed as before. The method pulls down the hide, and the putrefaction can go too far, and the best to recommend it for sheepskins where the wool is the main consideration, the main point being that while the hide entirely destroys wool, this process leaves it intact, only loosening the roots. It is consequently still much used.

Another method of fellmoungering (dewooling) sheepskins is to paint the flesh side with a cream of lime made with a 10% solution of sodium sulphide and lay the goods in pile flesh to flesh, taking care that the liquor on the outside dry before the leather is ready for pulling in from 4 to 8 hours. Although this process may be used for any kind of skin, it is practically only used for sheep, as any other skin is depilated in this manner all plumping effect is lost. This method of being obtained in some way, it is an economy of time and material to place the goods in lime in the first instance.

Sometimes, in the commoner classes of sole leather, the hair is removed by painting the hair side with cream of lime and sulphide, or the same effect is produced by drawing the hides through a strong solution of sodium sulphide: this completely destroys the hair, actually taking it into solution. But the hair roots remain embedded in the skin, and for this reason such leather always shows a dirty buff.

Arsenic sulphide (realgar) is slaked with the lime for the production of leather such as place kid and glove kid. This method produces a very smooth grain (the tendency of sodium sulphide being to make the grain harsh and bold), and is therefore very suitable for the purpose, but it is very expensive.

Sufficient proof of the fact that it is not the lime which causes skins to unhair is found in the process of chemical liming patented by Payne and Pullman. In this process the goods are first treated with caustic soda and then with calcium chloride; in this manner lime is formed in the skin by the reaction of the two salts, but still the hair remains as tight as ever. If this process is to be used for unhairing and liming effect, the goods must be first subjected to a purdied walk to loosen the hair, and afterwards limed. Experiments made by the present writer also prove this theory. A piece of calf skin was subjected to sterilized lime for several months, at the end of which time the hair was as tight as ever: then bacterial infection was introduced, and the skin unhaird in as many days.

After liming it is necessary to unhair the goods. This is done by stretching a hide over a tanner’s beam (fig. 3), when with an unhairing knife (a, fig. 4), the beamsman partially scrapes and partially shaves off the hair and epidermis. Another workman, a “flesher,” removes the flesh or “net skin” (*panniculus adiposus*), a fatty matter from the flesh side of the skin, with the fleshing knife (two-edged), seen in b, fig. 4. For these operations several machines have been adapted, working mostly with revolving spiral blades or vibrating cutters, under which the hide passes in a fully extended state.

Among these may be mentioned the Leidgen unhairer, which works on a rubber bed, which “gives” with the irregularities of the hide, and the Wilson flesher, consisting of a series of knives attached to a revolving belt, and which also “give” in contact with irregularities.

At this stage the hide is divided into several parts, the process being known as “rounding.” The object of the division is: certain parts of the hide termed the “offal” are of less value than the “butt,” which consists of the prime part. The grain of the butt is fine and close in texture, whereas the offal grain is coarse, coarse and open, and if the offal is placed in the same superior liquors as the butt, being open and porous, it will absorb the whole of the tannin first; consequently the offal goes to a set of inferior liquors, often consisting of those through which the butts have passed. The hides are “rounded” with a sharp curved butcher’s knife; the divisions are seen in fig. 5.

The bellies, cheeks and shoulders constitute the offal, and are tanned separately although the shoulder is not often detached from the butt until the end of the “suspenders,” being of slightly better quality than the bellies. The butt is divided into two “bends.” This separation is not made until the tanning of the butt Fig. 4.—Tanner’s Knives and Pin. is finished, when it is cut into two, and the components sold as “bends,” although as often as not the butt is not divided. In America the hides are only a few inches in the back from head to tail, and tanned as hides. Dressing hides are more frequently rounded after tanning, the mode depending on the purpose for which the leather is required.

The next step is to remove as much “scud” and lime as possible, the degree of removal of the latter depending upon the kind of leather to be turned out. “Scudding” consists of working the already unhaird hide over the beam with an unhairing knife with increased pressure, squeezing out the dirt, which is composed of pigment cells, semi-soluble compounds of lime, and hide, hair sacks and soluble hide substances, &c. This exudes as a dirty, milky, viscous liquid, and mechanically brings the
LEATHER

lime out with it, but involves a great and undesirable loss of hide substance, heavy leather being sold by weight. This difficulty is now got over by giving the goods an acid bath first, to delime the surface; the acid fixes this soluble hide substance (which is only soluble in alkalies) and hardens it, thus preventing its loss, and the goods may then be scuffed clean with safety. The surface of all heavy leathers must be delimed to obtain a good coloured leather, the demand of the present day boot manufacturer; it is also necessary to carry this further with milder leathers than sole, such as harness and belly, &c., as excess of lime causes the leather to crack when finished. Perhaps the best material for this purpose is boric acid, using about 10 lb per 100 butts, and suspending the goods. This acid yields a characteristic fine grain, and because of its limited solubility cannot be used in excess. Other acids are also used, such as acetic, lactic, formic, hydrochloric, with varying success. Where the water used is very soft, it is only necessary to wash in water for a few hours, when the butts are ready for tanning, but if the water is hard, the lime is fixed in the hide by the bicarbonates it contains, in the form of carbonate, and the result is somewhat disastrous.

After deliming, the butts are scuffed, rinsed through water or weak acid, and go off to the tan pits for tanning proper. Any lime which remains is sufficiently removed by the acidity of the early tan liquors.

The actual tanning now begins, and the operations involved may be divided into a series of three: (1) colouring, (2) handling, and (3) laying away.

The colouring pits or "suspenders," perhaps a series of eight pits, consist of liquors ranging from 16° to 40° barykometer, which were once the strongest liquors in the yard, but have gradually worked down, having had some hundreds of hides through them; they now contain very little tannin, and consist mainly of developed acids which neutralize the lime, plump the hide, colour it off, and generally prepare it to receive stronger liquors.

The goods are suspended in these pits on poles, which are lifted up and down several times a day to ensure the goods taking an even colour; they are moved one pit forward each day into slightly stronger liquors, and take about from 7 to 18 days to get through the suspender stage.

The reason why the goods are suspended at this stage instead of being laid flat is that if the latter course were adopted, the hides would sink and touch one another, and the touch-marks, not being accessible to the tan liquor, would not colour, and uneven colouring would thus result; in addition the weight of the top hides would flatten the lower ones and prevent their plumping, and this condition would be exceedingly difficult to remedy in the after liquors. Another question which might occur to the non-technical reader is, why should not the process be hastened by placing the goods in strong liquors? The reason is simple. Strong tanning solutions have the effect of "drawing the grain" of felt, i.e. contracting the fibres, and causing the leather to assume a very wrinkled appearance which cannot afterwards be remedied; at the same time "case tanning" results, i.e. the outside only gets tanned, leaving the centre still raw hide, and once the outside is case-hardened it is impossible for the liquor to penetrate and finish the tanning. This condition being almost irreducible, the leather would thus be rendered useless.

After the "suspenders" the goods are transferred to a series of "handlers" or "floaters," consisting of, perhaps, a dozen pits containing liquors ranging from 30° to 55° barykometer. These liquors contain an appreciable quantity of both tannin and acid, once formed the "lay-aways," and are destined to constitute the "suspenders." In these pits the goods, having been evenly coloured off, are laid flat, handled every day in the "hinder" (weaker) liquors and shifted forward, perhaps every two days, at the tanner's convenience. The "handling" consists of lifting the butts out of the pit by means of a tanner's hook (fig. 6), piling them on the side of the pit to drain, and returning them to the pit, the top butt in the one handler being returned as the bottom in the next. This operation is continued throughout the process, only, as the hides advance, the necessity for frequent handling decreases.

The top two handler pits are sometimes converted into "dusters," i.e. when the hides have advanced to these pits, as each butt is lowered, a small quantity of tanning material is sprinkled on it.

Some tanners, now that the hides are set flat, put them in suspension again before laying away; the method has its advantages, but is not general. The goods are generally laid away immediately. The layer liquors consist of leached liquors from the fishings, strengthened with either chestnut or oakwood extract, or a mixture of the two. The first layer is made up to, say, 60° barykometer in this way, and as the hides are laid down they are sprinkled with fresh tanning material, and remain undisturbed for about one week. The second layer is a 70° barykometer liquor, the hides are again sprinkled and allowed to lie for perhaps two weeks. The third may be 80° barykometer and the fourth 90°, the goods being "dusted" as before, and lying undisturbed for perhaps three or four weeks respectively. Some tanners give more layers, and some give less, some more or less time, or greater or lesser strengths of liquor, but this tanning is still a typical modern one.

As regards "dusting" material, for mellow leather, mellow materials are required, such as myrobalans being the mellowest and mimosa bark the most astringent of those used in this connexion. For harder leather, as sole leather, a much smaller quantity of myrobalans is used, if any at all, a fair quantity of mimosa bark as a medium, and much valonia, which deposits a large amount of bloom, and is of great astringency. About 3 to 4 cwt. of a judicious mixture is used for each pit, the mellow material predominating in the earlier liquors and the most astringent in the later liquors.

The tanning is now finished, and the goods are handled out of the pits, brushed free from dusting material, washed up in weak liquor, piled and allowed to drip for 2 or 3 days so that the tan may become set.

Finishing.—From this stage the treatment of sole leather differs from that of harness, belting and moulder leathers. As regards the first, it will be found on looking at the dripping pile of leather that each butt is covered with a fawn-coloured deposit, known technically as "bloom"; this disguises the under colour of the leather, just like a coat of paint. The theory of the formation of this bloom is this. Strong solutions of tannin, such as are formed between the hides from dusting materials, are not able to exist for long without decomposition, and consequently the tannin begins to condense, and forms other acids and insoluble anhydrides; this insoluble matter separates in and on the leather, giving weight, firmness, and rendering the leather water-proof. It is known technically as bloom and chemically as ellagic acid.

After dripping, the goods are scoured free from surface bloom in a Wilson scouring machine, and are then ready for bleaching. There are several methods by which this is effected, or, more correctly several materials or mixtures are used, the method of application being the same, viz., the goods are "wetted" (steeped) for some hours in the bleaching mixture at a temperature of 110° F. The mixture may consist of either sumach and a light-coloured chestnut extract made to 110° barykometer, and 110° F., or some bleaching extract made for the purpose, consisting of bisulphid liquid quebracho, which bleaches by reason of the free sulphurous acid it
contains. The former method is best (though more expensive), as it removes less weight, and the light shade of colour is more permanent than that obtained by using bisulphited extracts.

After the first vatting the goods are laid up in pile to drip; meanwhile the liquor is again heated and allowed to remain for another twenty-four hours, again removed and allowed to drip for 2 to 3 days, after which they are oiled with cod oil on the grain and hung up in the sheds to dry in the dark. When they have dried to an indurated-skin-like condition, they are piled for two or three days, then left until a greyish "bloom" rises to the surface, they then are set out and stretched in a Wilson scouring machine; using brass rollers instead of the stone ones used for scouring, "pinned" over hand (with the three-edged iron, known in fig. 4, and when a thin bloom only is not removed by the machine, oiled and dried. When of a damp even colour they are "rolled on" between two heavy rollers like a wringing machine, the pressure being applied from above, hung up in the dark shed again until they are given another coat of oil, and dried right out. Only sufficient scouring is given to clean the goods, the object of the tanner being to leave as much weight in as possible, although all this superfusible tan has to be washed out by the currier before he can proceed.

Currying.—When the goods are dried from the sheds they are purchased by the currier. If, as is often the case, the tanner is his own currier, he does not tan the goods so heavily, or trouble about adding superfusible weight, but otherwise the after processes, the art of the currier, are the same.

Currying consists of working oil and grease into the leather to render it pliable and increase its strength. It was once thought that this was a mere physical effect produced by the oil, but such is not the case. Currying with animal oils is a second tannage in itself; the oils oxidize in the fibres and produce aldehydes, which are well-known tanning agents; and this double tannage renders the leather very strong. Then there is the lubricating effect, a very important physical action so far as the strength of the leather is concerned. Mineral oils are much used, but they do not oxidize to aldehydes or, for the matter of that, to anything else, as they are not subject to decomposition. They, therefore, produce no second tannage, and their action is merely the physical one of lubrication, and this is only more or less temporary, as, except in the case of the heavier greases, they slowly evaporate. Where animal fats and oils are used, the longer the goods are left in contact with the grease the better and stronger will be the leather.

In the "Einbrennen" process (German for "burning in"), the hides are thoroughly scoured, and when dry are dipped into hot grease, which is then allowed to cool; when it is nearly set the goods are removed and set out. This process is not much used in Great Britain.

In hand-stuffing bolting butts the goods are first thoroughly soaked in water to which has been added some soda, and then scoured in the usual way and put into the bolting machine. They are then lightly shaved, to take off the loose flesh and thin the neck. The whole of the mechanically deposited tannin is removed by scouring, to make room for the grease, and they are then put into a sumach vat of 40° barkometer to brighten the colour, hosed up to drip, and set out. If any loading, to produce fictitious weight, is to be done, it is done now, by brushing the solution of either epsom salts, barium chloride or glucose, or a mixture, into the flesh, and laying away in pile for some days to allow of absorption, when, perhaps, another coat is given. Whether this is done or not, the goods are hung up until "tempered" (denoting a certain degree of dryness), and then treated with dubbin. This is manufactured by melting down tallow in a steam-jacketed pan, and adding cod oil, the mixture being stirred continually; when quite clear, it is cooled as rapidly as possible by running cold water through the steam pan, the stirring being continued until it has set. The tempered leather having been set out on a glass table, to which the flesh side adheres, is given a thin coat of the dubbin on the grain, turned, set out on the flesh, and given a thick coat of dubbin. Then it is hung up in a wind shed, and as the moisture dries out the grease goes in. After two or three days the goods are "set out in grease", with a brass slicker, given a coat of dubbin on the grain slightly thicker than the first coat, then flesh dubbined, a slightly thinner coat being applied than at first, and stood at 70° F. The grease which is slacked off when "setting out in grease" is collected and sold. After hanging in the warm stove for 2 or 3 days the butts are laid away in grease for a month; they are then slicked out tight, flesh and grain, and buck tallowed. Hard tallow is first rubbed on the grain, when a slight polish is induced by rubbing with the smoothed rounded edge of a thick slab of glass; they are then hung up in the stove or stretched in frames to dry. A great deal of stuffing is now carried out by drumming the goods in hot hard fats in previously heated drums; and in modern times the tedious process of laying away in grease for a month is either left undone altogether or very considerably shortened.

In the tanning and dressing of the commoner varieties of kips and dried hides, the materials used are of a poorer quality, and the time taken for all processes is cut down, so that whereas the time taken to dress the better class of leather from 7 to 10 months, and in a few cases more, these cheaper goods are turned out in from 3½ to 5 months.

A considerable quantity of the leather which reaches England, such as East India tanned kips, Australian sides, &c., is bought up and retanned, being sold then as a much better-class leather. The first operation with such goods is to "strip" them of any grease they may contain, and part of their original tannage. This is effectually carried out by first soaking them thoroughly, laying them up to drip, and drumming for half an hour in a weak solution of soda; they are then washed by drumming in plenty of water, the water is run off and replaced by very weak sulphuric acid to neutralize any remaining soda; this is in turn run off and replaced by weak tan liquor, and the goods are so tanned by drumming for some days in a liquor of gradually increasing strength. The liquor is made up as cheaply as possible with plenty of solid quercrauch and other cheap extract, which is dried in with, perhaps, glucose, epsom salts, &c., to produce weight. Sometimes a better tannage is given to goods of fair quality, in which they are, perhaps, started in the drum and finished in layers, slightly better materials being used all through, and a longer time taken to complete the tannage.

The tannage of dressing hides for bag and portmanteau work is rather different from the other varieties described, in that the goods, after having had a rather longer liming, are "bated" or "puered." Bating consists of placing the goods in a wheel or paddle with hen or pigeon excrement, and paddling for from a few hours to 2 or 3 days. In puering, dog manure is used, and this being rather more active, the process does not take so long. This bating or puering is carried out in warm liquors, and the actions involved are several. First, the practical point of the operation is the removal of the lime and the solution of the hair shafts and a certain amount of interfibrillar substance. In this way the goods are pulled down to a soft flaccid condition, which allows of the removal of short hair, and when another coat of oil is applied the hair stands up and appears slicker, or longer, upon the beam. The beam is partially taken into solution and partially removed mechanically during the scudding. A large quantity of hide substance, semi-soluble and soluble, is lost by being carried away with the liquor, but a second liquor, another area, and not weight, is the main consideration. Theoretically the action is due to bacteria and bacterial products (organized fermenters and enzymes), unorganized fermenters or vegetable fermenters like the yeast used for wine or bread, the amylase and phosphatase from plants such as ammonium and calcium salts and phosphates, all of which are present in the manure. The evolved gases also play their part in the action.

There are several bates upon the market as substitutes for dung bate. A most popular one was the American "Tiffany" bate, made by keeping a weak glue solution warm for some hours and then introducing a piece of blue cheese to start fermentation; when fermenting, glucose was added, and the bate was then ready for work. Those and other bates have been more or less supplanted by "erodin," discovered after years of research by Mr Wood (Nottingham) and Drs Popp and Becker (Vienna). This is an artificial bate, containing the main constituents of the dung bate. It is supplied
in the form of a bag of nutrient material for bacteria to thrive on and a bottle of bacterial culture. The nutrient material is dissolved in water and the bacterial culture added, and after allowing the mixture to get working it is ready for use. Many tons of this bate are now being used per annum. Its advantages are: (1) that it is clean, (2) that it is under perfect control, and (3) that stains and bate burns, which so often accompany the dung bate, are absolutely absent. Bate burns are caused by not filtering the dung bate through coarse sacking before use. The accumulation of useless solid matter settles on the skins if they are not kept well in motion, causing excessive action in these places.

After pulling down the goods to a soft, silky condition by bating or purging, it is necessary, after scudding, to plump them up again and bring them into a clean and fit condition for receiving a finishing tan. This is done by "drenching" in the bran drench. A quantity of bran is scaled and allowed to ferment. When the fermentation has reached the proper stage the goods are placed, together with the bran liquor, in a suitable pit or vat, and are allowed to remain until they have risen three times; this rising to the surface is caused by the gaseous products of the fermentation being caught by the skin. The plumping action of the bran is due to the acids produced during fermentation and also in part to the gases, and the cleansing action is due to the mechanical action of the particles of bran rubbing against the grain of the skins. After drenching, the goods are washed free from bran, and are ready for the tanning process.

Drenching, now that all kinds of skins are available, is not so much used for heavy hides as for light skins, it being found much more convenient and cheaper to use acids. In fact, bating and purging are being gradually replaced by acid baths in the case of heavy leathers, the process being carried out as deliming for sole leather, only much more thoroughly in the case of dressing leather.

The tanning of dressing hides, which are not rounded into butts and offal, is briefly as follows. They first enter a series of colouring pits or suspenders, and then a series of handlers, by which time they should be plump and coloured through; in this condition they are split either by means of a union or band-knife splitting machine (fig. 7).

**Fig. 7.—Band Knife Splitting Machine.**

This latter is the most popular machine, and consists essentially of an endless band knife a, which revolves at considerable speed with its cutting edges close to the sides of a pair of rollers through which the leather is fed and pressed against the knife. The lower of these rollers is made of short segments or rings, each separately capable of yielding so as to accommodate itself to the unequal thicknesses of various parts of a hide. The thickness of the leather to be cut is gauged to the utmost minuteness by means of the hand screws b & c which raise or lower the upper roller. The knife edge of the cutter is kept keen by rubbing against revolving emery wheels d as it passes round. So delicately can this machine effect its work that slices of leather uniform throughout and as thin as paper can be easily prepared by it, and by its aid it is quite common to split hides into as many as three useful splits.

The dressing hides are usually split in two. Here we will leave the split (fresh) for a time and continue with the treatment of the grain. After splitting, they enter another series of handlers, are then piled up for a day or two, and thrown into a large drum with sumach mixed to a paste with hot water and a light-coloured extract. They are drummed in this for one hour to brighten and mellow the grain, washed up in tepid liquor, piled for two days, and drummed with cold oil or some other suitable oil or mixture; they are now piled for a day or two to absorb, dried out, flattened on the grain, and flesh folded.

The splits are rinsed up in old sumach liquor and drummed with cheap extracts and adulterants, such as sugar, glucose, barium chloride, epsom salts, &c., after which they are piled up to drain, dried to a "sammied" condition, rolled to make firm, and dried right out.

In the dressing hide tannage very mellow materials are used. Gambier and myrosolans form the main body of the tannage, as do a little quebracho extract, mimosa bark, sumach, and extracts.

**Upper Leather**.—Under the head of upper leather are included the thin, soft and pliable leathers, which find their principal, but by no means exclusive, application in making the uppers of boots and shoes, which may be taken as a type of a class of leathers. They are made from such skins as East Indian kips, light cow and horse hides, thin split hides, such as those described under dressing leather, but split rather thinner, and cald. The preparatory dressing of such skins and the tanning operations do not differ essentially from those already described. In proportion to the thinness of the skin treated, the processes are more rapidly finished and less complex, the tannage is a little yellower and the hides more mellow as valonia being used sparingly if at all. Generally speaking, the goods have a longer and mellower liming and bating, the lime being more thoroughly removed than for the leathers previously described, to produce greater pliability, and everything must tend in this direction. The heavier hides and kips are split as described under dressing leather, and then tanned right out.

**Currying of the Lighter Leathers.**—The duty of the currier is not solely directed towards heavier leathers; he is also entrusted with the dressing and fitting of the lighter leathers for the shoemaker, coachbuilder, saddle, &c. He has to pare the leather down and reduce inequalities in thickness, to impregnate it with fatty matter in order to render it soft and pliable, and to give it such a surface dressing, colour, and finish as will please the eye and suit the purpose. Besides this, the fact that machinery is used by some curriers for nearly every mechanical operation, while others adhere to the manual system, renders it almost impossible to give in brief an outline of operations which will be consistent with any considerable number of curriers.

The following may be taken as a typical modern dressing of waxed calf or waxed kips. The goods are first of all soaked down and brought to a "sammied" condition for shaving. In the better-class leathers, hand-shaving is still adhered to, as it is maintained that the drag of the shaving machine on the leather causes the "nap" finish to be coarser. Hand-shaving is carried out on a beam or strong frame of wood, supporting a stout plank faced with lignum vitae or any other hard wood, on which is a knife, fig. 8, a double-edged rectangular blade about 12 in. by 5 in., girded on either side along its whole length and down the centre with two bars 3 in. wide, leaving each blade protruding 1 in. beyond them; it has a straight handle at one end and a cross handle at the other in the plane of the blade. The edges of this knife are first made very keen, and are then turned over so as to form a wire edge, by means of the wire edge shaver, a simple device. Two straight steel tools shown in fig. 9. The wire edge is preserved by drawing the thinner of the two steel tools along the interior angle of the wire edge and then along the outside of the turnover edge. The skin being thrown flesh uppermost over the vertical beam, the shaver presses his body against it, and leaning over the top holds the knife by its two handles almost at right angles to the beam, and by the skin resting against the sharp blade and by varying the pressure passing a fold between his fingers to test the progress of his work. After shaving, the goods are thoroughly soaked, allowed to drip, and are ready for "scouring." This operation has for its object the removal of bloom (ellagic acid) and any other superficial adherent matter. The scouring solution consists of a weak solution of soft soap and borax. This is first well brushed into the flesh of the leather, which is then "slicked" (sliced) out with a steel slicker shown at S fig. 9. The upper part
of the "slicker" is wooden, and into it a steel, stone, brass or vulcanite blade is forced andfastened. The wooden part is grasped in both hands, and the blade is half rubbed and half scraped over the surface of the leather in successive strokes, the angle of the slicker being a continuation of the angle which the thumb on the face of the worker form with the body, perhaps 30° to 45°, with the leather, depending upon the pressure to be applied. The soap and borax solution is continually dashed on the leather to supply a body for the removal of the film with the slicker. The hide is now turned, and the grain is scored with a stone slicker and brush, with soap and borax solution, it is then rinsed up, and sent to dry; when dampened, it is "set" i.e., the grain is laid smooth with a brush or steel slicker and dried right out. It is now ready for "stuffing," which is invariably done in the drum with a mixture of starch and "soil" oil, to which is sometimes added cod oil and wool fat; it is then set out on the grain and "canked" on the flesh, the grain side is glassed, and the leather dried right out. The goods are now "rounded," i.e. the lighter coloured parts of the flesh side are then laid in pile for a few days to mellow, when they are again brushed, and they are then ready for the drum board (R, fig. 9) to bring up the grain, or to give a granular appearance to the leather and make it supple, when they may be turned flesh inwards and bruised, a similar operation to graining, essence of sumach is then added, and the leather is then dried. At this stage the goods are known as "finished russet," and are stored until ready for waxing.

For waxing, the first operation is to black the goods. In England this is generally done by hand, but machinery is much more used in the United States. The process consists of well brushing the flesh side of the skins a black preparation made in one of two ways. The older recipe is a mixture of lampblack, oil, and perhaps a little tallow; the newer recipe consists of soap, lampblack, longwood extract, and water. Either of these is brushed well into the flesh side, which is then glassed up by means of a thick slab of glass, the smooth rounded edges being used with a sticking motion, and the goods are hung up to dry. When dry they are oiled with cod oil, and are ready for sizing. Goods blocked with even backing, and sized once, those prepared with oil backawing are sized twice. The size used for soap black soap black skins may consist of a mixture of beeswax, pitch, linseed oil, tallow, soap, glue, and longwood extract. For oil black backs the size, soap, and glue are put into the flesh side, and the oil is run through the skin, and mixed with the oil extract, after the application of which the goods are dried and the "top sizing" applied; this consists of glue, cod oil, beeswax, tallow, venice turps, black dye and water. The sizings having been heat, thoroughly rubbed or soft brushed, are thoroughly rubbed in with a glass slicker, crush marks are removed by padding with a soft leather pad, and the goods, after being dried out, are ready for the market.

In the dressing of waxed grain leathers, such as French calf, satin leather, &c., the preparatory processes are much the same as for waxed leathers described above as far as stuffing, after which the grain is prepared to take the colour by light hand scouring with weak soap and borax solution. The dye is applied, and so far as they may be touched up by means of a brush of either soap, turkey red oil or methylated spirit is added to the solution. Acid colours are preferably used, and three coats are given to the dry leather, which is then grained with an arm board, and finally sized. The back tallow to the grain leather, and brushed. The dye or stain may consist of aniline colours for coloured leathers, or, in the case of blacks, consecutive applications of logwood and iron solutions are given.

Finishing dressing Hides for Bag and Portmanteau Work.—The hides as received from the tanner are soaked down, piled to the dam, and shaved, generally by machine, after which they are scoured, as under waxed leather; sunnached and hung up to dry; when just damp they are set out with a brass slicker and dried right out. The grain is now filled by applying a solution of either Irish moss, linseed mucilage or any other mucilaginous filling material, and the flesh is sized with a mixture of mucilage and French chalk, after which the goods are brushed-stained with an aniline dye, to which has been added linseed mucilage to give it body; two coats are applied to the sammed leather. When the goods have sammed, after the last coat of stain, they are "printed" with a brass roller in a "jigger," or by means of a machine embosser. This process consists of impressing the grain by pressure from a brass roller, on which the pattern is deeply etched. After printing, the flesh side is sponged with a weak milk solution, lightly glased and dried, when the grain is sponged with weak linseed muellage, almost dried, and brushed by machine. The hides are now finished, by the application either of pure buck tallow or of a mixture of cannauba wax and soap; this is rubbed up into a slight gloss with a flannel.

Light Leathers.—So far only the heavier leathers have been dealt with; we will now proceed to discuss lighter calf, goat, sheep, seal, &c.

In tanning light leathers everything must tend towards suppleness and pliability in the finished leather, in contrast to the firmness and solidity required in heavy leathers. Consequently, the liming is longer and mellower; puring, bathing or some batachial substitute always follows; the tannage is much shorter; and mellow materials are used. A deposition of bloom in the goods is not often required, so that very soon after they are sent through the machine they are known as tanned. The materials largely used are sumach, oak bark, gambier, myrobalans, mimosa, willow, birch and larch barks.

As with heavy leathers, so also with light leathers, there are various ways of tanning; and quality has much to do with the elaboration or modification of the methods employed. The tanning of all leathers will be dealt with first, dyeing and finishing operations being treated later.

The vegetable-tanned leather de luxe is a bottle-tanned skin. It is superior to every other class of vegetable-tanned leather in every way, but owing to competition not a great deal is now produced, as it is perhaps the most expensive leather ever put on the market. The method of preparation is as follows.

The skins are usually hard and dry when received, so they are at once soaked down, and when sufficiently soft are either milled in the stocks, drummed in a lattice drum (American dash wheel, fig. 10), or "broken down" over the beam by working on the flesh with a blunt unhairing knife. They are next mellow limed (about 3 weeks), sulphide being used if convenient, unhairied and then described with heavy leathers, and are then ready for puring. This process is carried through at about 80° F., when the goods are worked on the beam, rinsed, drenched in a bran drench, scudded, and are ready for tanning. The skins are now folded down the centre of the back from neck to butt (tail end), flesh outwards, and the edges are tightly stitched all round to form bogs, leaving a aperture at one of the shanks for filling; they are now turned grain outwards and filled with strong sumach liquor and some quantity of solid sumach to fill up the interstices and prevent leakage, after which the open shank is tied up, and they are then thrown into warm sumach liquor, where they float about like so many pigs, being continually pured under the surface with a dale. When struck through they are piled on a shelf above the vat, and by their own weight the liquor is forced through the skins. The tannage takes about 24 hours, and when finished the stitching is ripped out, the skins are sliucked out, "strained" on frames and dried. "Straining" consists of nailing the skins out on boards in a stretched condition, or the stretching in frames by means of strings laced in the edge of the frame and attached to the edge of the skin.

The commoner sumach-tanned skins (but still of very good quality) are tanned in paddle wheels, a series of three being most
conveniently used in the same manner as the three-pit system of liming, each wheel having three packs of skins through it before being thrown away. This paddling tends to make a bolder grain, as the skins are kept in continual motion, and work over one another. Some manufacturers finish the tannage with a mixture of sumach and oak bark; this treatment yields a less porous product. Others, when the skins are strained and in a semi-dry condition, apply neatsfoot or other oil, or a mixture of glycerine and oil, to the grain to lubricate it and make it more supple; the glycerine mixture is generally used for "chrome" leather, and will be discussed later under that head.

The skins tanned as above are largely dressed as morocco. Originally "morocco" was produced by the Moors in southern Spain and Morocco, whence the industry spread to the Levant, Turkey and the Mediterranean coast of Africa generally, where the leather was made from a species of sumach. Peculiarly enough, the dying was carried out before the tanning, with Roman alum as "mordant" and kermes, which with an hour produced a fine red colour. Such leather was peculiarly clear in colour, elastic and soft, yet firm and fine in grain and texture, and has long been much prized for bindings, being the material in which most of the artistic work of the 16th-century binders was executed. Now, in addition to the genuine morocco made from goat skins, we have imitation or French moroccos, for which split calf and especially sheep skins are employed, and as the appearance of morocco is the result of the style of graining and finish, which can now be imitated by printing or embossing machines, morocco can be made from all varieties of thin leather.

Great quantities of "Persian" (East India tanned) sheep and goat are now dressed as moroccos and for innumerable other purposes, the method being as follows: The goods are tanned with turbar bark and cassia bark, besides being impregnated with sawdust, even to the extent of 30%. The first operation is to "strip" them of the oil and original tannage as far as possible, by drumming in a solution of soda; the soap thus formed is got rid of by thoroughly washing the goods, when they are "soared" in a weak bath of sulphuric acid to brighten the colour and remove iron stains, after which they are dried, washed, scraped and re-touched, finally drumming in warm sumach, allowing about 4 oz. per skin. They are then soaked out, dried and are ready for dyeing.

The tanning of sheep and lamb skins differs very essentially from the tanning of goat and other leathers, mainly in the preparatory processes. As the wool is completely destroyed by lime, other methods have to be resorted to. The process usually practised is known as "sweating"; this consists of hanging the most skins up in a warm room, whereby a small quantity of lime is set free, and the wool is reduced to a condition of sufficient tenacity to set in. The chamber is always kept warm and saturated with moisture, either by means of a steam jet or water sprinklers. During the process large quantities of ammoniacal vapours are given off, after which the skins are washed and dried, rubbed, and the wool slips easily; at this stage the goods are removed, for if the putrefaction goes too far the grain of the skin is irretrievably ruined. The wool is now "pulled" by pullers, who throw it into a vat arranged to receive the different qualities; for one pelt may have three different grades of wool on it.

Other methods of dewooling are to paint the flesh with a solution of sodium sulphide, or cream of lime made with a solution of sodium sulphate; in either case the goods are piled flesh to flesh in the preparatory processes. As the wool is completely destroyed by lime, other methods have to be resorted to. The process usually practised is known as "sweating"; this consists of hanging the most skins up in a warm room, whereby a small quantity of lime is set free, and the wool is reduced to a condition of sufficient tenacity to set in. The chamber is always kept warm and saturated with moisture, either by means of a steam jet or water sprinklers. During the process large quantities of ammoniacal vapours are given off, after which the skins are washed and dried, rubbed, and the wool slips easily; at this stage the goods are removed, for if the putrefaction goes too far the grain of the skin is irretrievably ruined. The wool is now "pulled" by pullers, who throw it into a vat arranged to receive the different qualities; for one pelt may have three different grades of wool on it.

Basils are sheep skins tanned in various ways. English basils are tanned with oak bark, although, as in all other leathers, inferior tannages are now common; Scotch basils are tanned with larch bark, Australian and New Zealand basils with mimosa bark and Turkish basils with galls. The last are the most common kinds of skins imported into Great Britain, and are usually only selected for the presence of the skins.

Skivers are the grain splits of sheep skins, the fleshes of which are finished for chamois leather. The goods are split in the limed state, just as the grains are ready for tanning, and are subsequently treated much as sumach-tanned goat skins, or in any other convenient way; the fleshes, on the other hand, go back into the limes, as it is necessary to get a large quantity of lime into leather which is to be finished as chamois.

Russia Leather was originally a speciality of Russia, where it was made from the hides of young cattle, and dressed either a brownish red or black colour for upper leather, bookbinding, dressing-cases, purses, &c. It is now made throughout Europe and America, the best qualities being obtained from Austria. The empyreumatic odour of the old genuine "Russia" leather was derived from a long-continued contact with willow and the bark of the white birch, which contains the odorous betulin oil. Horse hides, calf, goat, sheep skins and even splits are now dressed as "Russia leather," but most of these are of a decidedly inferior quality, and as they are merely treated with birch bark oil to give them something of the odour by which Russia leather is ordinarily recognized, they scarcely deserve the name under which they pass. The present-day genuine Russia leather is tanned like other light leathers, but properly in willow bark, although poplar and spruce fir barks are used. After tanning and setting out the goods are treated with the empyreumatic oil obtained by the dry distillation of birch bark. The red colour commonly seen in Russia leather is now produced by aniline colours, but was originally gained by the application of an infusion of Brazil wood, which was rubbed over the grain with a brush or sponge. Some time ago Russia leather got into disrepute because of its rapid decay; this was owing to its being dyed with a very acid solution of tin salts and cochineal, the acid completely destroying the leather in a year or two. The black leather is obtained by staining with logwood infusion and iron acetate. The leather, if genuine quality, is very watertight and strong, and owing to its impregnation with the empyreumatic oil it wards off the attacks of insects.

The tannage of seal skins is now an important department of the leather industry of the United Kingdom. The skins form one of the items of the whaling industry which principally centres in Dundee, and at that port, as well as at Hull and Peterhead, they are received in large quantities from the Arctic regions. This skin is that of the white hair seal, and must not be confused with the expensive seal fur obtained from Russian and Japanese waters. These white hair seal skins are light but exceedingly close in texture, yielding a very strong tough leather of large area and fine gold grain, known as Levean morocco. The area of the skins renders them suitable for upholstery work, and the flesh splits are dressed in considerable quantity for "japaned" ("patent") leather and "hobsters," which are used to grain other skins on, the raised bull affording a grip on the skin being grained and thus preventing slipping. When the skins arrive in the tannery (generally lightly salted) they are drummed in old tannin liquid, or oil soft leather thin, and removed, then alternately dipped in warm water and "blubbed" with a sharp knife; they are then alternately dipped in warm water and drummed several times to remove fat, after which they are heavily limed, as they are still very greasy, and after unhairing and fleshing they are heavily ppered for the same reason. The tannage takes about a month, and is much the same as for other leathers, the skins being split when "struck through."

Alligator leather is now produced to some extent both in the United States and India. The belly and flanks alone are useful. These skins are particularly suitable for handbags, gloves, &c. Layers are not given. The leather is used mostly for small fancy goods, and is much imitated on sheepskin by embossing.

Snake and frog skins are also dressed to some extent, the latter having a better market. A considerable item in the exports of Japan is the "snake skin" (or "shagreen") for which the skins are dressed mostly for cigar cases and pocket books. The general procedure is first to lime the goods and then to remove any scales (in the case of snake skins) by scraping with an unhairing knife on a small board, after which the skins are batted and tanned in sumach by paddling.

A considerable amount of leather is now produced in Australia from the skins of kangaroo, wallaby and other marsupials. These skins are usually treated as hide勇敢. The preliminary tanning agents being mimosa bark, black bark and similar barks which abound in Australia. The leather produced is of excellent quality, strong and pliable, and rivals in texture and appearance the kid of Europe; but the circumstance that the animals exist only in the wild state renders them a limited and insecure source of leather.
Japan and Enamel Leathers.—Japanning is usually done on flesh splits, whereas enamelling is done on the grain, and if splits are used they are primed and boarded. The leather should be mellowed, soft, free from grease, with a firm grain and no inclination to stretch. It is first shaved very smooth, thoroughly scoured with a stone, sumached, washed, slicked out tight and dried; when “sammed,” the grain is buffed to remove scratches and oiled, the goods are then whitened or fluffed, and if too hard, brushed by boarding; enamel goods are now grained. The skins are now tightly nailed on boards and any holes patched up with brown paper, so that the japanning will not touch the flesh when the first thick coat of japan or the “dahl” is put on. This is applied so thickly that it cannot soak in, with fine-toothed slicker, and then placed in a hot stove for twenty-four hours until quite dry; the coating is then pumiced smooth and the second thinner coat, termed “blanback,” is applied. This is dried and pumiced, and a fine coating of japan or copal varnish is finally given. This is dried and cooled, and if the goods are for enamel they are boarded.

English japans sometimes contain light petroleum, but no turps. The secret of successful japanning lies in the age of the oil used; the older the linseed oil, the better the result. To prepare the ground coat, boil 10 gallons linseed oil for one hour with 2 lb lime at the boil, and then boil for half an hour. Use the hot oil, and boil the oil again with 2 lb. of alum and 1 lb. of soda, allowing the whole to cool. To this hot oil, add 5 to 10 lb. of japan for the first coat, and add 2 lb. of alum and 1 lb. of soda, and boil another hour. This oil, when thoroughly hot, is thinned with 10 gallons light petroleum. For the second coat, boil 10 gallons linseed oil for 2 hours with 2 lb. prussian blue and 2 lb. lampblack; when of a thin jelly consistency thin with 5 gallons of benzole or benzine. For the third coat, boil 3 gallons of linseed oil for 1 hour, then add 1 lb. prussian blue, and boil for another hour; thin with 10 gallons petroleum and apply with a brush in a warm room. After drying, the goods are mellowed by exposure to the sun for at least three days.

Tawing.—Wool rugs are, after the preliminary processes, sometimes tanned in oak bark liquors by padding, but are generally “tawed,” that is, dressed with alum and salt, and are therefore more suitably dealt with under that head. Tawing implies that the conversion of skins into leather is carried out by means of a mixture of which the more important constituents are mineral salts, such as alum, chrome and iron, which may or may not be supplemented with fatty and albuminous matter, both animal and vegetable.

As an example of alum tawing, calf kid may be taken as characteristic of the process; glove kid is also treated on similar lines. The goods are prepared for tawing in a manner similar to the preparation of tanned leathers, arsenical limes being used to ensure a fine grain. After being well drenched and washed, the goods are ready for the tawing process. On the continent of Europe it is usual for the goods to be thrown into a tub with the tawing paste and trodden with the bare feet, although this old-fashioned method is gradually being driven out, and the drum or tumbler is being used.

The tawing paste consists of a mixture of alum, salt, flour, egg yolk and water: the quantities of each constituent diverge widely; every dressier having his own recipe. The following has been used, but cannot well be classed as typical: For 100 lb. skin take 9 lb. alum, 3 lb. salt, 7 oz. of egg yolk, 12 oz. flour, and 1 gill of water, of which 2 gills is used to make a paste to the consistency of thin cream. The paste is then thinned down from 9 to 12 lb. flour, using 4 to 6 egg yolks for every pound of flour used. Olive oil is also mixed in sometimes. The skins are drummed or trodden, at intervals, in the warm paste for some hours, removed, allowed to cool and trodden again. The paste is then renewed, and “staked” by drawing them to and fro over a blunt knife fixed in the top of a post, and known as a knee stake; this process softens them very considerably. After staking, the goods are wet back and shaven with a small cutting knife, e.g., a circular convex-cone knife, the centre of which has been cut out, a piece of good bridging the cavity forming the grip, or with an ordinary currier’s shaving knife; the skins are now ready for dyeing and finishing.

Wool Rug Dressing.—Wool rugs are first thoroughly soaked, well washed and clean-fleshed, scoured well by rubbing into the wool a solution of hot soap and soda, and then lethered by rubbing into the flesh of the wet skins a mixture consisting of three parts of 5% solution of two parts of salt until they are practically dry; they are now piled up over-night, and the mixture is again applied. After the second or third application the goods should be quite lethered. Other methods consist of stretching the skins in frames and painting the flesh with a solution of alum and salt, or, better, with a solution of basic alum and salt, the

alum being made basic by the gradual addition of soda until a permanent precipitate is produced.

The goods are now meticulously rubbed down the most vigorous scouring will not remove the yellow tint of the wool, especially at the tips. There are several methods of bleaching, viz., by hydrogen peroxide, following up with a weak nitric bath; by potassium permanganate, following up with mixtures of permanganate and soda; by fuming in an air-tight chamber with burning sulphur. The last position of the method is the more general; the wet skins are hung in the chamber, an iron pot containing burning sulphur is introduced, and the exposure is continued over four hours, and then scoured in vitriol.

The next step is dyeing. If basic dyes are to be used, it is necessary to neutralize the acidity of the skins by careful addition of soda. After about 3 hours’ immersion, the skins will have changed in colour from bright yellow to bright green, one or two skins are cut in the thickest part, and if the green has struck right through, the pack is removed as tanned, washed up, and allowed to drain.
The "single-bath process" consists of paddling, drumming, or otherwise introducing into the skins a solution of a chrome salt, usually chrome alum, which is already in the basic condition, and therefore does not require reducing. The basic solutions are made as follows: For 10 lb. of skins the following quantities are used: 1 lb. of chrome salt, 4 lb. of water, and 2 lb. of washing soda already dissolved in 1 gallon of water, and 1/2 lb. of washing soda already dissolved in 9 gallons of water, and 2 lb. of washing soda already dissolved in 1 gallon of water are gradually added, with constant stirring. One-third of the solution is added to 80 gallons of water, to which is added 2 lb. of chrome salt, and the skin is introduced. The remaining two-thirds are introduced at intervals in two subsequent portions. Another liquor, used in the same way, is made by dissolving 3 lb. of potassium bichromate in hot water, adding 4 gallon strong hydrochloric acid and then, gradually, about 1 lb. of glucose or grape sugar; this reduces the chrome salt, vitrifies the effervescence ensuing. The whole is made up to 2 gallons and 5% to 15% of salt is added. In yet another method a chrome alum solution is rendered basic by boiling with "hypo," and after the reaction has ceased the solution is allowed to cool and then, a second reaction takes place.

After tanning, which takes from 8 hours to as many, and even more, days, depending upon the method used and the class of being dressed, the skins tanned by both methods are treated in a similar manner. A very fair leather may also be manufactured by using iron alum and salt and in the same manner as described under ordinary leather.

Combination Tannages.—Leathers tanned by mixtures or separate baths of both mineral and vegetable tanning agents have now taken an important position in commerce. Such leathers are the Swedish and Danish glove leathers, the United States "dongola leather," and French glazed kid. The usefulness of such a combination will be evident, for while vegetable tanning produces fullness, plumpness and resistance to water, the mineral dressing produces a softness unnatural to vegetable tannages without the use of large quantities of oils and fats. It may also be noted that once a leather has been thoroughly tanned with either mineral or vegetable materials, although it will absorb large quantities of the material which has not been first used, it will retain in the main the characteristics of the tannage, and as such leather is required in the manufacture of such tough and flexible leathers as "green leather," "combing leather" and "picker bands," but was first applied to the manufacture of imitation glazed kid by Kent in America, who, about 1878; discovered the principle of "fatliquoring," and named his product "dongola leather." The discovery of this process revolutionized the manufacture of combination leathers.

The Swedish and Danish glove leathers were first given a dressing of alum and salt, with or without the addition of flour and egg, and were then finished and coloured with vegetable materials, generally with madder and larch, in which case the madder and larch were resorted to. The "green leather" manufactured in England generally receive about a week's tannage in gambier liquors, and are finished off in hot alum and salt liquors, after which they are dried, and the cementing agents locked off. They are then wet back, and heavily stuffed with moellen, degras or sod oil. Kent, in the manufacture of his dongola leather, used mixed liquors of gambier alum and salt, and when tanned, washed the goods in warm water to remove excess of tanning agent, piled up to 3 me, and fatliquored. In making alum combinations it must be borne in mind that alum leather will not glaze, and if a glazed finish is required, a fairly heavy vegetable tannage should be first applied. For dull finishes the mineral tannage may advantageously precede the vegetable.

Very excellent chrome combination leather is also manufactured by a modification of Knapp's process, in which case the vegetable liquors are added to the tanning liquors, which are in this case being in great favour as the vegetable leathers. The use of other materials deprives the leather of its stretch, although they may be Advantageously used where the latter property is objectionable.

Oil Tanning.—Under the head of oil tanning is included "buff leather," "buck leather," "piano leather," "chamosi leather," and to a greater or lesser extent, "Prellet's crown or helvetia leather. The process of oil tanning dates back to antiquity, and was known as "shamoying," now spelt "chamosin." Chamosin is the ancient Egyptian method of treating leather, and forms an important branch of the leather industry. The theory of the process is the same as that of currying, which is nothing more or less than chamoising, viz., the lubrication of the fibres by the oil itself and the aldehyde tanning which takes place, due to the oxidation and decomposition of the esters of the fatty acids contained in the oil. The fact that an aldehyde tannage takes place seems to have been first discovered by Payne and Pullman, who took out a patent in 1808, covering formaldehyde and other aldehydes used in alkaline solutions. Their product, "Kaspine" leather, found considerable application in the way of military accoutrements. Chamosin, buff, buck and piano leathers are all manufactured by the same process slightly modified to suit the class of hide used, the last three being heavy leathers, the first light.

As regards the process used for chamosin leathers, the reader will readily see, from the account of the vegetable tannage of sheep skins, that after splitting from the tannages, the lames were thrown back into the pits for another three months' liming (six weeks in all) preparatory to being dressed as chamosin leather. It is necessary to time this process according to the quality of the goods, as the oil has not been removed by splitting, as in the case of sheep skins, it is "friised" off with a sharp knife over the beam. The goods are now rinsed, scudded and drenched, dried out until stiff, and stocked in the faller stocks with plenty of cold oil for 2 to 3 hours until they show signs of heating, when they are hung up in a cool shed. This process is repeated several times during a period of from 4 to 6 days, the heat driving the water out of the skins and the oil replacing it. In the end of this time the goods, which will have changed to a brown colour, are hung up and allowed to become dry as possible, when they are hung in a warm stove for some hours, after which they are piled to heat off, thrown into tepid water and put through a strong solution of chlorine and then hung in the wet state. The chromium is removed from the dressing machine is known commercially as "dregs" or "cream of mellen," and fetches a good price, as it is unrivalled for fatliquoring and related processes, such as stuffing, producing a very soft product. When the leather is sufficiently dry, it is then passed through a machine which removes the surface of the goods, leaving them fine and glossy.

Prellet's Helvetia or Crown Leather. The process of leather manufacture was discovered in 1850 by Theodor Klemm, a cabinetmaker of Würtemberg, who being then in poor circumstances, sold his patent to an Englishman named Prellet, who manufactured it in Southwark, and adopted a crown as his trade mark. Hence the name "crown" leather. The manufacture then spread through Switzerland and Germany, the product being used in the main for picker straps, beltling and purposes where waterproof goods were required, such as hose pipes and military water bags. No taste is imparted to the water by this leather.
Although tumbled worked and haired, semi-dry frames of product refined about fact, Peat Transparent and leather to be done with antiseptic and precipitated for some time, leather is extracted in a steel roller, which is caused to revolve rapidly. When shaved, the goods are stripped, washed up, soured, scudded and re-tanned in sumach, washed up, and slicked out, and are then ready for dyeing.

There are three distinct methods of dyeing, with several minor modifications. Tray dyeing consists of immersing the goods, from 2 to 4 dozen at a time, in two separate piles, in the dye solution at 60°C, contained in a flat wooden tray about 5 ft. X 4 ft. X 1 ft., and keeping them constantly moving by continually turning them from one pile to the other. The disadvantages of this method are that the bath rapidly cools, thus dyeing rapidly at the beginning and slowly at the termination of the operation; hence a large excess of dye is wasted, much labour is required, and the shades obtained are not so level as those obtained by the other methods. But the goods are under observation the whole time, a very distinct advantage when matching shades, and a white flesh may be preserved. The paddle method of dyeing consists of padding the goods in a large volume of liquor contained in a semi-circular wooden paddle for half to three-quarters of an hour. The disadvantages are that the liquor cools fairly rapidly, more dye is wasted than in the tray method, and a white flesh cannot be preserved. But larger packs can be dyed at the one operation, the goods are under observation the whole time, and a white flesh may be preserved.

The drum method of dyeing is perhaps best, a drum somewhat similar to that used by curriers being preferable. The goods are placed on the shelves inside the dry drum, the lid of which is then fastened on, and the machinery is started; when the drum is revolving at full speed, which should be about 12 to 15 revolutions per minute, the dye solution is added through the hollow axle, and the dyeing continued for half an hour, when, without stopping the drum, if desired, the goods may be fatliquored by running in the fatliquor through the hollow axle. The disadvantages are that the flesh is dyed and the goods cannot be seen. The advantages are that little labour is required, a large pack of skins may be treated, level shades are produced, heat is retained, almost complete exhaustion of the dye-bath is effected, and subsequent processes, such as fatliquoring, may be carried out without stopping the drum.

Of the great number of coal-tar dyes on the market comparatively few can be used in leather manufacture. The four chief classes are:

1. Acid dyes; 2. Basic or tannin dyes; 3. Direct or cotton dyes; 4. Indigo (lazur) dyes.

Acid dyes are not so termed because they have acid characteristics; the name simply denotes that for the development of the full shade of colour it is necessary to add acid to the dye-bath. These dyes are generally used for the introduction of strong shades, especially on cowhides, and need the addition of an acid to free the dye, which is the sulphonic acid. Although theoretically any acid (stronger than the sulphonic acid present) will do for this purpose, it is found in practice that only sulphuric and formic acids may be employed, because others, such as acetate, do not develop the full shade of colour. Acid sodium sulphate may also be successfully used.
LEATHER

Acid colours produce a full level shade without bronzing, and do not accentuate any defects in the leather, such as bad grain, &c. They are also moderately fast to light and rubbing. They are generally considered as leather that has been treated between 50° and 60° C. with an equal weight of sulphuric acid. The quantity of dye used varies, but generally for goat, persians, &c., from 25 to 30 oz. are used per ten dozen skins, and for calf hair much as again, dissolved in such a manner as to make a solution with the dye and water as is most convenient according to the method being used. If sodium bisulphate is substituted for sulphuric acid twice as much must be used, and if formic acid three times as much (by weight).

Basic dyes are salts of organic colour bases with hydrochloric or some other suitable acid. Basic colours precipitate the tannins, and thus, because of their affinity for them, dye very rapidly, tending to produce uneven shades, especially if the tannin on the skin is unchanged. They are much more intense in colour than the acid dyes, have a strong tendency to bronze, and are very inaccurate and weak and defective grain. They are also precipitated by hard waters, so that the hardness should be first neutralized by the addition of sodium carbonate, and the skin immersed for 1 hour in this solution, after the preliminary treatment with bicarbonate of soda, to make it more suitable for use, and to neutralize any excess of salt. The ebonising colours, including erythrosine, phloxine, rose Bengal, &c., are applied in a similar manner, and are specially used for the beautiful fluorescent pink shades they produce; acid and basic colours and mineral acids precipitate them.

The tannin colours, which include the alizarine and anthraquinone colours, are extremely fast to light, and require a mordant to develop the colour. They are specially applicable to chamois leather, although they are sometimes used for other purposes. The goods are washed and then treated with a solution of sodium carbonate, and the dye is applied and left to soak for 15 minutes, having been thoroughly washed before being dried. Iron salts are sometimes used by leather-stainers for saddening (dulling) the shade of colour produced, iron tannate, a black salt, being preferred. The dyed leather is then washed and allowed to dry. The dye is a yellowish brown shade, as they produce a yellowish-brown shade; it is therefore not necessary to use so much dye. About 2 oz. of tartar emetic and 8 oz. of salt is a convenient quantity for 1 dozen goat skins. The bath is raised from 10° to 20°, and this is continued for 20 to 30 minutes, or till the solution is clear after being filtered, and the leather washed. The leather is then dyed by applying a solution of the dye, acid, direct, or other colours, and then finished with basic colours; this procedure forms a colour layer, and colour layers are always faster to light and rubbing than the colours themselves.

Dyes are produced that are not fast to light, and are used for the dyeing of pale and "art" shades. They are applied in neutral or very slightly acid baths, formic and acetic acids being most suitable with the addition of a quantity of sodium chloride or sulphuric acid, to the goods having been washed and allowed to dry in the ordinary manner. The excess of salt. The ebonising colours, including erythrosine, phloxine, rose Bengal, &c., are applied in a similar manner, and are specially used for the beautiful fluorescent pink shades they produce; acid and basic colours and mineral acids precipitate them.

The mordant colours, which include the alizarine and anthraquinone colours, are extremely fast to light, and require a mordant to develop the colour. This brushing over with linseed mucilage prevents the dye from sinking too far into the leather; gelatine, Irish moss, starch, and gums are also used for the same purpose. These materials are also added to the staining solution to thicken it and further prevent its sinking.

When dry, the goods are stained by applying a 1/4% (usually) solution of a suitable basic dye, thickened with linseed, with a brush. Two men are usually employed on this work; one starts at the right end and works towards the left, and the other towards the right, so that the work is done towards each other, staining in sections; much skill is needed to obviate markings where the sections overlap. The goods may advantageously be bottomed with an acid dye or a dye-wood extract, and then the primary dye is applied. Two to three coats are given, drying between each. After the last coat of stain, and while the goods are still in a summated condition, a mixture of linseed mucilage and French chalk is applied to the flesh and glassed off wet, to give it a white appearance, and then the grain is rubbed by hand or with a dog's tail. As the grain is dried, or by hand, and dried out. For a bright finish the season may consist of a solution of 15 parts carnauba wax, 10 parts curd soap and 100 parts water boiled together; this is sponged into the grain, dried, and then polished with a duster or horsehair brush. A fuller finish is the grain is simply rubbed over with buck tallow and brushed. Hide bellies for small work are treated in much the same manner.

Glue Leather.—As these goods were tanned in alum, salt, flour and egg, any undue immersion in water removes the tannage; for this reason they are generally stained like bag hides, one man only being employed on the same skin. The skins are first thoroughly soaked in warm water, and the grains forced fresh supply, when they are re-eggd to replace that which has been lost. This is best done by drumming them for about 1½ hours in 40 to 50 egg yolks and 5 lb of salt for every hundred skins; they are then spread on a pile, and fermented for 24 hours, and are set out on the table ready for mordanting. The mordants universally used are ammonia or alkaline soft soap; in 1000 of the former or a 1% solution of the latter. When the goods have partially dried, in, looking in, are tested and usually applied wood preserving fluid, as well as that used for this operation, such as fusie, Brazil wood, pechwood, logwood and turmeric. After application of these colours the goods are summated and topped with a 1% solution of an acid dye, to which has been added 20% of methylated spirit to prevent frothing with the cold water. When dry, then drums are washed, and dried, and ironed with a flat iron which is used in laundry work.

Bookbinding Leathers.—A committee of the Society of Arts (London) has investigated the question of leather for bookbinding, and has come to the conclusion that the leather should be well-conditioned, and that the deacidified condition often observed in bindings less than fifty years old. This committee engaged in research work extending over several years, and the report in its results were given in 1873 by the Arts and Manufactures of the Society of Arts. The leather used should be as follows: The goods should be soaked and lined in fresh liquors, and butting and pairing should be avoided, weak organic acids or eroding being used; they should also be tanned with pyrogallol tanning materials, and preferably with a mixture. In shaving, they should only be necked and backed, i.e. only irregularities should be removed, as further shaving has a considerable weakening effect on the fibre. The striking out should not be heavy enough to lay the fibre. In dyeing, acid dyers and a few direct dyers are permissible, and in connexion with the use of sulphuric acid is strongly condemned, as it absolutely disintegrates the fibre; the use of formic, acetic and lactic acids is permitted. The use of salts of metallic acids is to be avoided, and in finishing, tight setting must, and damp glazing is not to be recommended. [Adapted from various sources.]

LEATHER, ARTIFICIAL. Under the name of artificial leather, or of American leather cloth, large quantities of a material having, more or less, a leather-like surface are used, principally for upholstery purposes, such as the covering of chairs, lining the tops of writing desks and tables, &c. There is considerable diversity in the preparation of such materials. A common variety consists of a web of calico coated with boiled linseed oil mixed with dryers and lamp-black or other pigment. Several coats of this mixture are uniformly spread, smoothed and compressed on the cotton surface by passing it between metal rollers, and when the surface is required to possess a glossy enamel-like appearance, it receives a finishing coat of copal varnish. A grained morocco surface is given to the material by previous it between suitably embossed rollers. Preparations of this kind have a close affinity to cloth waterproofed with indiarubber, and to such manufactures as ordinary waxcloth. An artificial leather which has been patented and proposed for use as soles for boots, &c., is composed of powdered scraps and cuttings of leather mixed with solution of gutta-percha dried and compressed. In place of the gutta-percha solution, oxidized linseed oil or dissolved resin may be used as the binding medium for the leather powder.

LEATHERHEAD, an urban district in the Epsom parliamentary division of Surrey, England, 18 m. S.S.W. of London, on the London, Brighton & South Coast and the London & South-Western railways. Pop. (1901) 4694. It lies at the foot of the North Downs in the pleasant valley of the river Mole. The church of St Mary and St Nicholas dates from the 14th century. St John's Foundation School, opened in London in 1852, is devoted to the education of sons of poor clergymen. Leatherhead has brick-making and brewing industries, and the district is largely residential.

LEATHES, STANLEY (1830–1900), English divine and Orientalist, was born at Ellesborough, Bucks, on the 21st of March 1830, and was educated at Jesus College, Cambridge, where he graduated B.A. in 1852, M.A. 1853. In 1853 he was the first Tyrwhitt's Hebrew scholar. He was ordained priest in 1857, and after serving several curacies was appointed professor of Hebrew at King's College, Cambridge, in 1863. In 1868–1870 he was Boyle lecturer (The Witness of the Old Testament to Christ), in 1873 Hulsean lecturer (The Gospel its Own Witness), in 1874–1875 Bampton Lecturer (The Religion of the Christ) and from 1876–1879 Merton lecturer. He was a member of the Old Testament revision committee from 1870 to 1885. In 1876 he was elected prebendary of St Paul's Cathedral, and he was rector of Cliffe-at-Hoo near Gravesend (1880–1889) and of Much Hadham, Hertfordshire (1889–1900). The university of Edinburgh gave him the honorary degree of D.D. in 1878, and his own college made him an honorary fellow in 1885. Besides the lectures noted he published Studies in Genesis (1880), The Foundations of Morality (1882) and some volumes of sermons. He died in May 1900.

His son, Stanley Mordaunt Leathes (b. 1861), became a fellow of Trinity, Cambridge, and lecturer on history, and was one of the editors of the Cambridge Modern History; he was secretary to the Civil Service Commission in 1903 to 1907, when he was appointed a Civil Service Commissioner.

LEAVEN (in Med. Eng. levain, adapted from Fr. levain, in same sense, from Lat. leavenum, which is only cited for the sense of 'a mass of alcohol, compost,' or a ferment; the name refers to a substance which gives fermentation, particularly in the making of bread, properly a portion of already fermented dough added to other dough for this purpose (see BREAD). The word is used figuratively of any element, influence or agency which effects a subtle or secret change. These figurative usages are mainly due to the comparison of the kingdom of Heaven to leaven in Matt. xiii. 33, and to the warning against the leaven of the Pharisees in Matt. xvi. 6. In the first example the word is used of a general influence, but the more usual significance is that of an evil agency. There was among the Hebrews an association of the idea of fermentation and corruption, which may have been one source of the prohibition of the use of leavened bread in sacrificial offerings. For the usage of unleavened bread at the feasts of the Passover and of Massoth, and the connexion of the two, see PASSOVER.

LEAVENWORTH, a city and the county-seat of Leavenworth county, Kansas, U.S.A., on the W. bank of the Missouri river.
LEBANON

Pop. (1900) 20,735, of whom 3402 were foreign-born and 2923 were negroes; (1910 census) 10,563. It is one of the most important railroad centers in the west (the Missouri River being served by the Atchison, Topeka & Santa Fe, the Chicago, Burlington & Quincy, the Chicago, Rock Island & Pacific, the Chicago Great Western, the Missouri Pacific, the Union Pacific and the Leavenworth & Topeka railways. The city is laid out regularly in the bottom-lands of the river, and its streets are named after Indian tribes. Rolling hills surround it on three sides. The city has many handsome public buildings, and contains the Cathedral of the Immaculate Conception, Leavenworth being the see of a Roman Catholic bishop. The public institutions include the Kansas State Protective Home (1869) for negroes, an Old Ladies' Rest (1893), St Vincent's Orphans' Asylum (1886, open to all sects) and a Guardian Angels' Home (1890), for negroes—all private charities aided by the state; also St John's Hospital (1870), Cushing Hospital (1863) and Leavenworth Hospital (1900), which are training schools for nurses. There is also a branch of the National Home for Disabled Volunteer Soldiers.

In the suburbs there are state and United States penitentiaries. Leavenworth is a trading centre and has various manufactures, the most important being foundry and machine shops, and factories. The city's factory products increased in value from $3,251,460 in 1900 to $4,131,797 in 1905, or 27.7%. There are valuable coal mines in Leavenworth and the immediate vicinity. About 3 m. N. of the city, on a reservation of about 6000 acres, is Fort Leavenworth, an important United States military post, associated with which are a National Cemetery and Service Schools of the U.S. Army (founded in 1881 as the U.S. Infantry and Cavalry School and in 1901 developed into a General Service and Staff College). In 1907 there were three general divisions of these schools: the Army School of the Line, for officers (not below the grade of captain) of the regular army and for militia officers recommended by the governors of their respective states or territories, offering courses in military art, engineering, law and languages; the Army Signal School, also open to regular and militia officers, and having departments of field signalling, signal engineering, topography and languages; and the Army Staff College, in which the students are the highest graduates from the two other schools. The courses are included in the departments of military art, engineering, law, languages and care of troops. The course is one year in each school. At Fort Leavenworth there is a colossal bronze statue of General U. S. Grant erected in 1889. A military prison was established at Fort Leavenworth in 1875; it was used as a civil prison from 1895 to 1906, when it was re-established as a military prison. Its inmates were formerly taught various trades, but owing to the opposition of labour organizations this system was discontinued, and the prisoners are now employed in work on the military reservation.

The fort, from which the city took its name, was built in 1827, in the Indian country, by Colonel Henry Leavenworth (1783-1834) of the 3rd Infantry, for the protection of traders going down the Missouri river and Sante Fe. The town site was claimed by Missourians from Weston in June 1854, Leavenworth thus being the oldest permanent settlement in Kansas; and during the contest in 1854-5, over the question of the right to the Missouri river, Leavenworth was in territorial days and until after 1880, the largest and most thriving commercial city of the state, and rivaled Kansas City, Missouri, which, however, finally got the better of it in the struggle for railway facilities.

LEBANON (from Semitic laban, "to be white," or "whitish," probably referring not to snow, but to the bare white walls of chalk or limestone which form the characteristic feature of the whole range), in its widest sense is the central mountain mass of Syria, extending for about 100 m. from N.E. to S.S. W. It is bounded W. by the sea, N. by the plain Jun Akkar, beyond which rise the mountains of the Ansarishieh, and E. by the inland plateau of Syria, mainly steppe-land. To the south Lebanon ends about the point where the river Litany bends westward, and at Banias. A valley narrowing towards its southern end, and now called the Buka'a, divides the mountainous mass into two great parts. That lying to the west is called Jebel Libnan; the greater part of the eastern mass now bears the name of the Eastern Mountain (Jebel el-Sharki). In Greek the western range was called Libanos, the eastern Antilibanos. The southern extension of the latter, Mount Hermon (g.e.), may in many respects be treated as a separate mountain.

Lebanon and Anti-Lebanon have many features in common; in both the southern portion is less arid and barren than the northern, the western valleys better wooded and more fertile than the eastern. In general the main elevations of the two ranges form pairs lying opposite one another; the forms of both ranges are monotonous, but the colouring is splendid, especially when viewed from a distance; superimposed on this flat land only a few vales offer picturesquely. The landscapes are most picturesque, their rich green contrasting pleasantly with the bare brown and yellow mountain sides. The finest scenery is found in N. Lebanon, in the Maronite districts of Kesrawan and Bsherrch, where the gorges are veritable canyons, and the villages are often very picturesqueley situated. The south of the chain is more open and undulating. Anti-Lebanon is the barest and most inhospitable part of the system.

The district west of Lebanon, averaging about 20 m. in breadth, slopes in an intricate series of plateaux and terraces to the Mediterranean. The coast is for the most part abrupt and rocky, often overhung by cliffs, but on the north and south sides when viewed from the sea it does not suggest the extent of country lying between its cliffs and the lofty summits behind. Most of the mountain spurs run from east to west, but in northern Lebanon the pre-valley formation of the range is north-westerly, and on the south some ridges run parallel with the principal chain. The valleys have for the most part been deeply excavated by mountain streams; the apparently inaccessible heights are crowned by numerous villages, castles or clusters embosomed among trees. The chief perennial streams, beginning from the north, are the Nahar Akkar, N. Arka, N. el-Bari, N. Kadlasha, "the holy river" (the valley of which begins in the immediate neighbourhood of the highest summits, and descends through long valleys to the Mediterranean and the sea at Tripoli), Wadi el-Joz (falling into the sea at Batrun), Wadi Fidar, Nahr Ibrahim (the ancient Adonis, having its source in a recess of the great mountain amphitheatre where the famous sanctuary of Aphrodite, the ancient Venus, lies), Nahr Akkar (ancient Lycus), Nahr Beirut (the ancient Magoras, entering the sea at Beirut), Nahr Damur (ancient Tamyras), Nahr el-Awali (ancient Bostraeus, which in the upper part of its course is joined by the Wadi al-Bahrani). The "Awali and the Nahr el-Zahrani, the only other considerable streams before we come to east-south-west, in consequence of the interposition of a ridge subordinate and parallel to the central chain. On the north, where the mountain bears the special name of Jebel Akkar, the main ridge of Lebanon rises gradually to its summit, the ranges bounding it to the north and north-east, among them that of the Nahar el-Kefir, the Eleutherus of the ancients, which rises in the Jebel el-Abiad on the eastern slope of Lebanon, and afterwards, skipping the district, Nahr el-Kebir, which is the Nahar el-Akkar, lunging to the north, which, as a rule falls away suddenly towards the east, occur several small elevated terraces having a southward slope; among these are the Wadi en-Nusur ("vale of eagles"), and the basin of Mimoun, which extends from the sea to the mountains, and which, like the other valleys, is subject to earthquakes. Of the streams which descend into the Buka'a, the Berdani rises in Jebel Sunnin, and enters the plain by a deep and picturesque mountain cleft at Zahleh.

The most elevated summits occur in the north, but even these are of very gentle gradient. The "Cedar block" consists of a double line of four and three summits respectively, ranged from north to south, with a deviation of about 3°. Those to the east are Uyun Urqush, Makmal, Muskiyya (or Nabi el-Shemal) and Kas Zahr el-Kafir, descending to the sea, and between them and Kas Zahr el-Kafir, the height of Zahr el-Kafir, by barometric measurement, is 10,018 ft.; that of the others does not reach 10,000 ft. South from them is the pass (8351 ft.) which leads from Baalbek to Tripoli; the great mountain amphitheatre on the west side of its summit is remarkable. Farther south is a second group of lofty summits—the snow-capped Sunnin.
from Beirut; its height is 842 ft. Between this group and the more southerly Jebel Kenesh (about 6700 ft.) lies the pass (4700 ft.) traversed by the French post road between Beirut and Damascus. Among the bare summits still farther south are the long ridge of Jebel Kfardebian (mostly of granite), with Jebel Nih (about 6100 ft.), near which is a pass to Sidon, and the Jebel Rihant (about 5400 ft.).

The Buka'a, the broad valley which separates Lebanon from Anti-Lebanon, is about 15 miles wide, and its waters are conveyed to the sea by two rivers, the Bannock and the Baulbeik, at an elevation of about 3600 ft., and separated only by a short mile at their sources. That flowing northwards, El-'Asi, is the ancient Orontes (q.v.); the other is the Litany. In the lower part of its course the latter is bordered on a deep and narrow bed; at Barhuz it is spanned by a great natural bridge. Not far from the point where it suddenly trends to the west, immediately above the romantic valley, at an elevation of 1500 ft., the imposing ruin of el-Ward (the ancient Ribes) stands on a precipitous spur. It is 600 ft. high from the base, and has a width of 23 ft. Its top is 84 ft. above the present plain of Baalbek. In its lower part the Litany bears the name of Nahar el-Kasimiyah. Neither the Orontes nor the Litany has any important affluent.

The Buka'a used to be known as Coelestria (Strabo, xvi. 2, 21); but that word as employed by the ancients had a much more extensive application. At present its full name is Buka'a el-'Aziz (the dear Buka'a), and its northern portion is known as Sahlet Ba'albeik (the plain of Baalbeik). The valley is from 4 to 6 m. broad, with an undulating surface.

The Anti-Lebanon chain has been less fully explored than that of Lebanon. Apart from its southern outskirts it is 67 m. long, for its length from the Bekaa to the coast is 16 miles, and comprises one of the highest peaks, Hasya-Homs, and in its northern portion is very arid. The range has not so many offshoots as occur on the west side of Lebanon; under its precipitous slopes stretch table-lands and broad plateaus, which increase in elevation from north to south. The ridges of Anti-Lebanon—known by a term which signifies a sort of trellising—steadily increase in width. Along the western side of northern Anti-Lebanon stretches the Khasha'a, a rough red region lined with juniper trees, a succession of the hardest limestone crests and ridges, bristling with bare rock and crag that shelter tufts of vegetation, and are divided by a succession of grassy ravines. On the eastern side the parallel valley of 'Asil el-Ward deserves special mention: the descent towards the plain eastwards, as seen for example at Mza el-Ward, shows that the plain is completely separated by a deep, very narrow gorge. Few perennial streams take their rise in Anti-Lebanon; one of the finest and best watered valleys is that of Helburn, the ancient Chalybon, the Helbon of Ezek. xxvii. 18. The thigh of Helybon is described as 'Ain Balk (8257 ft.), which has a splendid view; the Filat block, including Talat Musa (8271 ft.) and the adjoining Jebel Nebi Barn (7900 ft.); and a third group near Bludan, in which the most prominent hill is el-Mal.'

At the eastern end of the Anti-Lebanon the Litany valley descends westward the first to claim mention is the Wadi Yafala; a little farther south, lying north and south, is the rich upland valley of Zabadani, where the Barada has its highest source; and then comes the Buka'a valley, which lies between the valley of the Litany and the river of Jebel ed-Dahr. At its southern end it contracts and merges into the plain of Banias, thus enclosing Mount Hermon on its north-west and west-east; southeast from the Hasbany branch of the Litany flows the meadow-land Merj 'Iyun, the ancient Ijon (1 Kings xv. 20).

Vegetation.—The western slope of Lebanon has the common characteristics of the flora of the Mediterranean coast, but the Anti-Lebanon chain is peculiar to the mountainous region of the steppes, and the Mediterranean species are met with only sporadically along the water-courses. Forest and pasture land do not properly exist: the place of the first is for the most part taken by a low brushwood; grasses and herbs are abundant, and the plant life consists only so long as patches of snow continue to lie. The rock walls harbour some rock plants, but many absolutely barren wildernesses of stone occur. (1) On the western slope, to a height of 1600 ft., is the flora of coastal Syria in general and of the central south of Asia Minor. Characteristic trees are the locust tree and the pine; in Melia Azedarach and Ficus Sycomorus (Beirut) is an admixture of foreign and partially subalpine elements. The great mass of the vegetation, however, is of the low-growing type (species of the genus Dipsacaceae of the western Mediterranean), with small and stiff leaves, and frequently thorny and aromatic, as for example the (Quercus cocciifera), Smilax, Citrus, Littescus, Calycotome, &c. (2) Next comes, from 1600 to 6500 ft., the mountain region, which may also be called the forest region, still exhibiting sparse woods and isolated trees wherever shelter, moisture and the inhabitants have permitted their growth. From 1600 to 3200 ft. is a zone of dwarf hard-leaved oaks, amongst which occur the Oriental forms Fontanesia phillyreaeoides, Acer syriacum and the beautiful red-edged and columnar trees of the first may be seen a tall pine, Pinus brutia, characteristic. Between 2400 and 6200 ft., is the region of the two most interesting forest trees of Lebanon, the cypress and the cedar. The former still grows thickly, especially in Phoenicia and the eastern Anti-Lebanon; the latter is rare and peculiarly distributed; it is found in the following variety. In the upper Kisah valley there is a cedar grove of about three hundred trees, amongst which five are of gigantic size. (See also Cedrus.) The cypress and cedar zone exhibits a variety of rare evergreen and coniferous trees: of the first may be mentioned several oaks—Quercus subalpina (Kotschy), Q. Cerris and the hop-hornbeam (Ostrya); of the second the rare Cilician silver fir (Abies cedrata) may be noticed. Next come the junipers, of which the highest is Juniperus excelsa, a hard-leaved plant with horns, and, with fruit as large as plums, J. drupacea. But the chief ornament of Lebanon is the Rhododendron ponticum, with its brilliant purplish flower clusters; a peculiar evergreen, Vinca linnottatica, also adds beauty to this zone. (3) Into the alpine region (6000 to 10,400 ft.) penetrate a few very stunted oaks (Quercus subalpina), the junipers already mentioned and a barberry (Berberis cretica), which sometimes spreads into closed thickets. Then follow the low, dense, green, pillow-like dwarf bushes, thorny and grey, common to the Oriental highlands—Astragalus and the peculiar Acantholimon. They are found to within 300 ft. of the highest summits.

Upon the exposed mountain slopes a species of rhabarb (Rhamnus alaternus) is abundant, and also a vert (Victoria canescens) excellent for sheep. The spring vegetation, which lasts until July, appears to be rich, especially as regards showy plants, such as Corydalis, Gagea, Celochium, Puschkinia, Geranium, Ornithogalum, &c. The flora of Lebanon, which is supplied to a great extent by the elevation, contains no forms related to the northern alpine flora, but suggestions of it are found in a Draba, an Androsace, an Alctis and a violet, occurring, however, only in local species. On the highest summits are found various species of Gentiana, Silene, Gentianella, Geranium, Galium, Buphthalmum, Galanthus, Galax, Galium, Tussilago, and the flowery semi-alpine species of Galium, Euphorbia, Astragalus, Veronica, Jurinea, Festuca, Scrophularia, Geranium, Asphodeline, Allysum, Aspilia; and, on the margins of the snow fields, a Taraxacum and Convolvulus demississ. The flora of Lebanon is a mixture of the Mediterranean, the Oriental and the semi-alpine. The flora of Lebanon is one of the finest in Europe and northern Asia.

Zoology.—There is nothing of special interest about the fauna of Lebanon. The bird life is exceedingly rich; all the larger birds and the smaller song birds are found here, and in abundance. The eagle and the vulture may occasionally be seen of eavable kinds partridges and wild pigeons are the most abundant.

Population.—In the following sections the Lebanon proper will alone be considered, without reference to Anti-Lebanon, because the peculiar political status of the former range since 1864 has effectuated differentiat it; whereas the Anti-Lebanon still forms an integral part of the Ottoman province of Syria (q.v.), and neither its population nor its history is readily distinguishable from those of the surrounding districts.

The total population in the Lebanon proper is about 400,000, and is increasing faster than this development of the province will admit. There is consequently much emigration, the Christian surplus going mainly to Egypt, and to America, the Druses to the latter country and to the Haoran. The emigrants to America, however, usually return after making money, build new houses and start new villages.

(1) Maronites (q.v.) form about three-fifths of the whole and have the north of the mountain almost to themselves, while even in the south, the old Druse stronghold, they are now numerous. Feudalism is practically extinct among them and with the decline of the Druses, they have leaned towards the Moslems. In the rest of the area, they have lived much of their warfare habit together with their arms. Even their instinct of nationality is being sensibly impaired by their gradual assimilation to the Papal Church, whose agents exercise an influence in the mountains which is even stronger than the ecclesiastical elections and church government. They are strong also in the Buka'a, and have colonies in most of the Syrian cities.

(2) Orthodox Eastern form a little more than one-eighth of the whole, and are strongest in S. Lebanon (Metn and Kurah districts). Syrians by race and Arab-speaking, they are descendants of those who "Melkites" who took the side of the Byzantine church in the time of Justinian II. against the Moslems and eventually the Maronites. They are among the most progressive of the Lebanon elements.

(3) Greek Uniate are less numerous, forming little more than
LEBANON

one-twelfth, but are equally progressive. Their headquarters is Zahlé; but they are found also in strength in Metn and Jezzîn, where they help to counterbalance Druses. They sympathize with the Maronites against the Orthodox Eastern, and, like both, are of Syrian stock. The chief town is Bâlût, and its extent is ascribed to the Chaldean spirit; exceedingly doubtful, they may be at least as aboriginal as the Maronites, and a remnant of an old Incarnationist population which did not accept the new creed, kept in this province the old Church free from those influences which modified Druse creed. They own the chief town at Jebe'a, and have the reputation, like most heretical communities in the Sunni part of the Moslem world, of being exceedingly fanatical and intractable. It is undoubtedly the case that they are suspicious of seyrets and defiant of interference. Another small body of Shiites, the Isma'ilites (Assassins (q.v.) of the crusading chronicles), also said to be of Persian origin, live about Kadmos at the extreme N. of Lebanon, but outside the limits of the privileged province. They may be described as heretical, but the mixed population, as a whole, displays the usual characteristics of mountaineers, fine physique and vigorous independent spirit; but its ancient truculence has given way before strong government action since the middle 19th century, and the great increase of agricultural pursuits, to which the purely pastoral are now quite secondary. The culture of the mulberry and silk, of tobacco, of the olive and vine, of many kinds of fruits and cereals, has expanded enormously, and the Lebanon is now probably the most productive region in Asiatîc Turkey in proportion to its area. It exports largely through Beirut and Saida, using the French railway which crosses S. Lebanon on its way to Damascus, and the excellent gasoline mule-paths made since 1883. Lebanon has thick deposits of lignite coal, but of inferior quality owing to the presence of iron pyrites. The abundant iron is little worked. Manufactures are of small account, the raw material going mostly to the coast; but olive-oil is made, together with various wines, of which the most famous is the vino d'oro, a sweet liqueur-like beverage. This wine is not exported in any quantity, as it does not bear a voyage well and is not made to keep. Bee-keeping is general, and there is an export of eggs to Egypt.

History.—The inhabitants of Lebanon have at no time played a conspicuous part in history. There are remains of prehistoric occupation, but we do not even know what races dwelt there in the historical period of antiquity. Probably they belonged chiefly to the group of Semitic tribes; the Bible mentions Hivites (Judges iii. 3) and Giblites (Judges xi. 10). Lebanon was included within the ideal boundaries of the land of Israel, and the whole region was well known to the Hebrews, by whose poets its many excellences are often praised. How far the Phoenicians had any effective control over it is unknown; the absence of their monuments does not argue much real jurisdiction.

Nor apparently did the Greek Seleucid kingdom have much to do with the Mountain. In the Roman period the district of Phœnícia extended to Lebanon. In the 2nd century, with the inland districts, it constituted a subdivision of the province of Syria, having Emesa (Homs) for its capital. From the time of Diocletian there was a Phœnícia ad Libanum, with Emesa as capital, as well as a Phœnícia Maritima of which Tyre was the chief city. Remains of the Roman period occur throughout Lebanon. By the 6th century it was evidently virtually independent again; its Christianization had begun with the immigration of Monothelite sectaries, fleeing from persecution in the Antioch district and Orontes valley. At all times Lebanon has been a place of refuge for unpopular creeds. Large part where the mountaineers took Monothelites and initiated the national distinction of the Maronites, which begins to emerge in the history of the 6th century. The sectaries, after helping Justinian II. against the caliph Abd-ar-Rahîm, turned on the emperor and his Orthodox allies, and were exterminated. Islam now began to penetrate S. Lebanon, chiefly by the immigration of various more or less heretical elements, Kudîr, Turkoman, Persian and especially Arab, the latter largely after the break-up of the kingdom of Hîr, and early in the 11th century these coalesced into a nationality (see DRUSES) under the congenial influence of the Incarnationist creed brought from Cairo by Isma'ilî of Jezzîn and other emissaries of the caliph Hakim and his vizier Hama. The subsequent history of Lebanon to the middle of the 19th century will be found under DRUSES and MARONITES, and it need only be stated here that Latin influence began to be felt in N. Lebanon during the Frank period of Antioch and Palestine, the Maronites being inclined to take part of the crusading princes against the Druses and Moslems, who were still regarded as heretic Monothelites by Abû'l-faragius (Bar-Hecneaus) at the end of the 13th century; nor is their effectual reconnection to Rome much older than 1736, the date of the mission sent by the pope Clement XII., which fixed the actual status of their church. An informal French protection had, however, been exercised over them for some time previously, and with it began the feud of Maronites and Druses, the latter incited and spasmodically supported by Ottoman pashas. The feudal organization of both, the one under the house of Khazîn, the other under those of Ma'an and Shehab successively, was in full force during the 17th and 18th centuries; and it was the break-up of this in the first part of the 19th century which produced the anarchy that culminated after 1840 in the civil war. The Druses renounced the old amirs when Beşir al-Kâssim opened the Maronites in 1841, and the Maronites definitely revolted from the Khazîn in 1858. The events of 1860 led to the formation of the privileged Lebanon province, finally constituted in 1861. It should be added, however, that among the Druses of Shuf, feudalism has tended to re-establish itself, and the power is now divided between the Jumblatt and Yezbecki families, a leading member of which is almost always Ottoman kaimakam of the Druses, and locally called amîr.

The Lebanon has now been constituted a sanjak or muesserrîflik, dependent directly on the Porte, which acts in this case in consultation with the six sanjaks or muesserrîflik of Syria, consisting of 7,000 villages from N. to S. (from the boundary of the sanjak of Tripoli to that of the caça of Saida), and has a mean breadth of about 28 m. from the coast to the interior, and a length along the coast from the village of the Edge of the Druze. The province is divided into 16 districts, each governed by a Governor (mushir) who must be a Christian in the service of the sultan, approved by the powers, and has, so far, been chosen from the Roman Catholics owing to the great preponderance of Latin Christians in the province. He resides at Beirut, and is assisted by a Sanjak Bey (q.v.). At every census, the Governor's term of office is fixed for three years, then for ten, his term has been fixed since 1892 at five years, the longer term having aroused the fear of the Porte, which a personal domination should be established. Under the government are seven kaimakams, all Christians except one in Shuf, and forty-seven moudirs, who all depend on the kaimakams except one in the home district of Deir al-Kamar. A central mejî'd council of twelve members is composed of four Maronites, three Druzes, two Moslems, one Armenian and one Metawali. This was the original proportion, and it has not been altered in spite of the decline of the Druses and increase of the Maronites. The members are elected by the seven cazas. In the districts there are about 9,000 shëhihs (see DRUSES) and other courts of First Instance, under the mejî'd, and in the smaller towns of the moudir, and in the individual cases moudir, shëhihs (see DRUSES) are abolished, i.e. they often persist under Ottoman forms, and three courts of First Instance under the mejî'd, and to the petty courts of the moudirs. Judges are appointed by the governor, but shëhihs by the villages. Commercial and litigation cases are carried to Beirut. The police is recruited locally, and no regular troops appear in the
LEBANON—LEBEL

LE BEAU, CHARLES (1702-1778). French historical writer, was born at Paris on the 15th of October 1702, and was educated at the Collège de Sainte-Barbe and the Collège du Plessis; at the latter he remained as a teacher until he obtained the chair of rhetoric in the Collège des Grasins. In 1748 he was admitted a member of the Academy of Inscriptions, and in 1752 he was nominated professor of eloquence in the Collège de France. From 1755 he held the office of perpetual secretary to the Academy of Inscriptions, in which capacity he edited fifteen volumes (from the 25th to the 39th inclusive) of the Histoire of that institution. He died at Paris on the 1st of March 1778.

The only work with which the name of Le Beau continues to be associated is his Histoire des Empereurs, en commençant à Constantin le Grand, in 22 vols. 12mo (Paris, 1756-1770), being a continuation of C. Rollin's Histoire Romaine et J. B. L. Crevier's Histoire des empereurs. Its usefulness arises entirely from the fact of its being a faithful résumé of the Byzantine historians, (Le Beau had not the originality or artistic power of his own. Five volumes were added by H. P. Amelhu (1781-1811), which brought the work down to the fall of Constantinople. A later edition, under the ear of M. de Saint-Martin and afterwards of Brossel, has had the benefit of careful revision throughout, and has received considerable additions from Oriental sources.

LEBEL, JOSEPH (1794-1865). Belgian statesman, was born at Huy on the 3rd of January 1794. He received his early education from an uncle who was parish priest of Hanaut, and became a clerk. By dint of energy he raised money to study law at Liége, and was called to the bar in 1819. At Liége he formed a fast friendship with Charles Rogier and Paul Devaux, in conjunction with whom he founded at Liége in 1824 the Mathieu Langhebrer, afterwards Le politique, a journal which helped to unite the Catholic party with the Liberals in their opposition to the ministry, without manifesting any open disaffection to the Dutch government. Lebel had not contemplated the separation of Holland and Belgium, but his hand was forced by the revolution of 1830. In 1831 he was elected district to the Belgian chambers of commerce, and became minister of foreign affairs in March 1831 during the interim regency of Surlet de Chokier. By proposing the election of Leopold of Saxe-Coburg as king of the Belgians he secured a benevolent attitude on the part of Great Britain, but the restoration to Holland of part of the duchies of Limburg and Luxemburg provoked a heated opposition to the treaty of London, and Lebel was accused of treachery to Belgian interests. He resigned the direction of foreign affairs on the accession of King Leopold, but in the next year became minister of justice. He was elected deputy for Brussels in 1833, and retained his seat until 1848. Differences with the king led to his retirement in 1834. He was subsequently governor of the province of Namur (1838), ambassador to the Frankfort diet (1839), and in 1840 he formed a short-lived Liberal ministry. From this time he held no office of state, though he continued his energetic support of liberal and anti-clerical measures. He died at Huy on the 10th of March 1865.

Lebel published La Belgique depuis 1837 (Brussels, 4 vols., 1852). Lettres aux électeurs belges (8 vols., Brussels, 1853-1856). His Souvenirs personnels et correspondance diplomatique 1854-1881 (Brussels, 1880). His papers have been published by A. Fréron, in the Biographie nationale de Belgique; and T. Juste, Joseph Lebeau (Brussels, 1865).

LEBEL, JEAN (d. 1370). Belgian chronicler, was born near the end of the 13th century. His father, Gilles le Beal des Changes, was an alderman of Liége. Jean entered the church and became a canon of the cathedral church, but he and his brother Henri followed Jean de Beaumont to England in 1327, and took part in the border warfare against the Scots. His will was made in 1369 and dated 2 June 1370. Nothing more is known of his life, but Jacques de Hemricourt, author of the Miroir des nobles de Hesbaye, has left a eulogy of his character, and a description of the magnificence of his attire, his retinue and his hospitality. Hemricourt asserts that he was eighty years old or more when he died. For a long time Jean Lebel (or le Bel) was only known as a chronicler through a reference by Froissart, who quotes him in the prologue of his first book as one of his authorities. A fragment of his work.

province except on special requisition. The taxes are collected directly, and must meet the needs of the province, before any sum is remitted to the Imperial Treasury. The latter has to make deficits good. Ecclesiastical jurisdiction is exercised only over the clergy, and all rights of excommunication are abolished.

This constitution has worked well on the whole, the only serious hitch having been due to the tendency of governors-general and kommandir to attempt to supersede the majjisz by autocratic action, and to overrule a certain measure of elections. The latter was called to these tendencies in 1892 and again in 1902, on the appointments of new governors. Since the last date there has been no complaint. Nothing now remains of the former French predominance in the Lebanon, except a certain interest in the fact that the railway is French, and by the precedence in ecclesiastical functions still accorded by the Maronites to official representatives of France. In the Lebanon, as in N. Arabia, the traditional character of the Mohammedan Empire has been greatly impaired by the non-religious character of the Republic. Like Italy, she is now regarded by Eastern Catholics with distrust as an enemy of the Holy Father.

See the "Éloge" in vol. xxx. of the Histoire de l'Académie des Inscriptions (1785), pp. 190-209.

LEBANON, a city of Saint Clair county, Illinois, U.S.A., on Silver Creek, about 24 m. S. E. of Saint Louis, Missouri. Pop. (1910) 9,628, of whom 618 were foreign-born, (1910 census) 10,240. It is served by the Philadelphia & Reading, the Cornell and the Cornwall & Lebanon railways. About 5 m. S. of the city are the Cornwall (magnétique) iron mines, from which about 18,000,000 tons of iron ore were taken between 1740 and 1902, and 846,848 tons in 1906. The ore yields about 40% of iron, and contains about 2-5% of sulphur, the roasting of the ores being necessary to produce a compact klin. The iron and steel manufactures are the most important industry in the city. There are also dealers in farm produce, such as flour and flour mills, the manufacture of paper and paper mill products, malt liquors, soda and farming implements. The municipality owns and operates its electric-lighting plant. Lebanon was chartered as a city in 1874.

LEBANON, a city and the county-seat of Lebanon county, Pennsylvania, U.S.A., in the fertile Lebanon Valley, about 25 m. E. by N. of Harrisburg. Pop. (1910) 17,628, of whom 618 were foreign-born, (1910 census) 19,420. It is served by the Philadelphia & Reading, the Cornell and the Cornwall & Lebanon railways. About 5 m. S. of the city are the Cornwall (magnétique) iron mines, from which about 18,000,000 tons of iron ore were taken between 1740 and 1902, and 846,848 tons in 1906. The ore yields about 40% of iron, and contains about 2-5% of sulphur, the roasting of the ores being necessary to produce a compact klin. LEBER—

350

in the MS. of Jean d’Outremeuse’s *Miroir des istores*, was discovered in 1847; and the whole of his chronicle, preserved in the library of Châlons-sur-Marne, was edited in 1863 by L. Polain. Jean Lebel gives as his reason for writing a desire to replace a certain misleading rhymed chronicle of the wars of Edward III. by a true relation of his enterprises down to the beginning of the Hundred Years’ War. In the matter of style Lebel has been placed by some critics on the level of Froissart. His chief merit is his refusal to narrate events unless either he himself or his informant had witnessed them. This scrupulousness in the acceptance of evidence must be set against his limitations. He takes on the whole a similar point of view to Froissart’s; he has no concern with national movements or politics; and, writing for the public of chivalry, he preserves no general notion of a campaign, which resolves itself in his narrative into a series of exploits on the part of his heroes. Froissart was considerably indebted to him, and seems to have borrowed from him some of his best-known episodes, such as the death of Robert the Bruce, Edward III., and the conquest of Salisbury, and the devotion of the burghers of Calais. The songs and virelais, in the art of writing which he was, according to Henricourt, an expert, have not come to light.

See L. Polain, *Les Francois Chroniques de messire Jehan le Bel* (1863); Kervyn de Lettenhove, *Bulletin de la société d’épuration de Bruges*, series ii., vols. vii. and ix.; and H. Pinien in *Biographie nationale de Belgique*. LEBER, JEAN MICHEL CONSTANT (1780–1859). French historian and bibliophile, was born at Orléans on the 8th of May, 1780. His first work was a poem on Joan of Arc (1804); but he wrote at the same time a *Grammaire général sythétique*, which attracted the attention of J. M. de Gérando, then secretary-general to the ministry of the interior. The latter found him a minor post in his department, which left him leisure for his historical work. He even took him to Italy when Napoleon was trying to organize, after French models, the Roman states which he had taken from the pope in 1809. Leber however did not stay there long, for he considered the attacks on the temporal property of the Holy See to be sacrilegious. On his return to Paris he resumed his administrative work, literary recreations and historical researches. While spending a part of his time writing vaudevilles and comic operas, he began to collect old essays and rare pamphlets by old French historians. His office was preserved to him by the Restoration, and Leber put his literary gifts at the service of the government. When the question of the coronation of Louis XVIII. arose, he wrote, as an answer to Volney, a minute treatise on the *Cérémonies du sacre* which was published at the same time by Charles X. Toward the end of Villem’s ministry, when there was a movement of public opinion in favour of extending municipal liberties, he undertook the defense of the threatened system of centralization, and composed, in answer to Raynouard, an *Histoire critique du pouvoir municipal depuis l’origine de la monarchie jusqu’à nos jours* (1838). He also wrote a treatise entitled *De l’état réel de la presse et des pamphlets depuis François 1er jusqu’à Louis XIV* (1834), in which he refuted an empty paradox of Charles Nicolas, who had tried to prove that the press had never been, and could never be, so free as under the Grand Monarch. A few years later, Leber retired (1839), and sold to the library of Rouen the rich collection of books which he had amassed during thirty years of research. The catalogue he made himself (4 vols., 1839 to 1852). In 1840 he read at the Académie des Inscriptions et Belles-Lettres two dissertations, an *Essai sur l’appréciation de la fortune privée au moyen âge,* followed by an *Examen critique des tables de prix du marché d’argent depuis l’époque de Saint Louis*; these essays were included in the Academy’s *Recueil de mémoires présents par divers savants* (vol. i., 1841), and were also revised and published by Leber (1847). They form his most considerable work, and assure him a position of eminence in the economic history of France. He also rendered good service to historians by the publication of his *Collection des meilleures dissertations, notices et traités relatifs à l’histoire de France* (20 vols., 1826–1840); in the absence of an index, since Leber did not give one, an analytical table of contents is to be found in Alfred Franklin’s *Sources de l’histoire de France* (1876, pp. 342 sqq.). In connection with the revolution of 1848, Leber decided to leave Paris. He retired to his native town, and spent his last years in collecting old engravings. He died at Orléans on the 22nd of December, 1859.

In 1832 he had been elected as a member of the *Société des Antiquaires de France*, and in the *Bulletin* of this society (vol. i., 1860) to be found the most correct and detailed account of his life’s works.

LEBEUF, JEAN (1687–1760), French historian, was born on the 7th of March, 1687 at Auxerre, where his father, a councillor in the parlement, was receiver of consignations. He began his studies in his native town, and continued them in Paris at the Collège Ste Barbe. He soon became known as one of the most cultivated minds of his time. He made himself master of practically every branch of medieval learning, and had a thorough knowledge of the sources and the bibliography of his subject. His learning was not drawn from books only; he was also an archaeologist, and frequently went on expeditions in France, always on foot, in the course of which he examined the monuments of architecture and sculpture, as well as the libraries, and collected a number of notes and sketches. He was in correspondence with all the most learned men of the day. His correspondence with Président Bouhier was published in 1885 by Ernest Petit; his other letters have been edited by the *Société des sciences historiques et naturelles de l’Yonne* (2 vols., 1854). He also published several volumes of his election as a member of the *Académie des Inscriptions et Belles-Lettres* (1740), a number of *Mémoires* which appeared in the *Recueil* of this society. He died at Paris on the 10th of April, 1760. His most important researches had Paris as their subject.

He published first a collection of *Dissertations sur l’histoire civile et ecclesiastique de Paris* (5 vols., 1739–1743), then an *Histoire de la ville et de tout le diocèse de Paris* (15 vols., 1745–1760), which is a mass of information, nothing less than the first undertaking to view the advance made by scholarship in the 19th century, it was found necessary to publish a second edition. The work of reprinting it was undertaken by H. Cocheris, but was interrupted (1863) before the completion of vol. iv. Adrien Angier resumed the work, giving Leber’s text, though correcting the numerous typographical errors of the original edition (5 vols., 1883), and added a sixth volume containing an analytical table of contents. Finally, Fernand Bournon completed the work by a volume of *Rectifications et additions* (1890), worthy to appear side by side with the original work.

LE BLANC, NICOLAS (1742–1866), French chemist, was born at Issoudun, Indre, in 1742. He made medicine his profession and in 1780 became surgeon to the duke of Orleans, but he also paid much attention to chemistry. About 1787 he was attracted to the urgent problem of manufacturing carbonate of soda from ordinary sea-salt. The suggestion made in 1789 by Jean Claude de la Méthière (1743–1817), the editor of the *Journal de physique*, that this might be done by calcining with charcoal the sulphate of soda formed from salt by the action of oil of vitriol, did not succeed in practice because the product was almost entirely sulphide of soda, but it gave Le Blanc, as he himself acknowledged, a basis upon which to work. He soon made the crucial discovery—which proved the foundation of the huge industry of artificial alkali manufacture—that the desired end was to be attained by adding a proportion of chalk to the mixture of charcoal and sulphate of soda. Having had the soundness of this method tested by Jean Darcet (1725–1801), professor of chemistry at the Collège de France, the duke of Orleans in June 1791 agreed to furnish Le Blanc with necessary apparatus for the sake of making the thing practicable. In the following September Le Blanc was granted a patent for fifteen years, and shortly afterwards a factory was started at Saint-Denis, near Paris. But it had not long been in operation when the Revolution led to the confiscation of the duke’s property, including the factory, and about the same time the Committee of Public Safety called upon all citizens who possessed soda-factories to disclose their situation and capacity and the nature of the methods employed. Le Blanc
had no choice but to reveal the secrets of his process, and he had the misfortune to see his factory dismantled and his stocks of raw and finished materials sold. By way of compensation for the loss of his rights, the works were handed back to him in 1800, but all his efforts to obtain money enough to restore them and resume manufacturing on a profitable scale were vain, and, worn out with disappointment, he died by his own hand at Saint-Denis on the 16th of January 1806.

Four years after his death, Michel Jean Jacques Diez (1749–1852), who had been préparateur to Dorat at the time he examined the process and who was subsequently associated with Le Blanc in its exploitation, published in the Journal de physique a paper claiming that it was he himself who had first suggested the addition of chalk; but a committee of the French Academy, which reported fully on the question in 1856, found that the composition that the merit was entirely Le Blanc’s (Com. rend., 1856, p. 555).

LE BLANC—LE BRUN

had on the 2nd of July 1793 took his seat in the Convention. He was sent as a representative on missions into the departments of the Somme and Pas-de-Calais, where he showed great severity in dealing with offences against revolutionaries (8th Brumaire, year II. to 2nd Messidor, year III.; i.e. 29th October 1793 to 10th July 1794). In consequence, during the reaction which followed the 9th Thermidor (27th July 1794) he was arrested on the 2nd Messidor, year III. (10th July 1795). He was tried before the criminal tribunal of the Somme, condemned to death for abuse of his power during his mission, and executed at Amiens on the 24th Vendémiaire in the year IV. (10th October 1795). Whatever Le Bon’s offences, his condemnation was to a great extent due to the violent attacks of one of his political enemies, Armand Guffroy; and it is only just to remember that it was owing to his courage that Cambrai was saved from falling into the hands of the Austrians.

LEBREJIA, or LEBRIXA, a town of southern Spain, in the province of Seville, near the left bank of the Guadalquivir, and on the eastern edge of the Seville Marshes, or Las Marismas. Pop. (1900) 10,997. Lebrija is 44 m. S. by W. of Seville, on the Seville-Cadiz railway. Its chief buildings are a ruined Moorish castle and the parish church, an imposing structure in a variety of styles—Moorish, Gothic, Romanesque—dating from the 14th century to the 16th, and containing some early specimens of the carving of Alonso Cano (1601–1667). There are manufactures of bricks, tiles and earthenware, for which clay is found in the neighbourhood; and some trade in grain, wine and oil.

Lebrija is the Nabrissa or Nebrisso, surnamed Veneria, of the Romans; by Silanus Italicus (iii. 393), who connects it with the worship of Dionysus, the name is derived from the Greek ναβίς, which is meant for a "fawn-skin," associated with Dionysiac ritual. Nebrishah was a strong and populous place during the period of Moorish domination (from 711); it was taken by St Ferdinand in 1249, but again lost, and became finally subject to the Castilian crown and Alphonso of Aragon, the Wise in 1264. It was the birthplace of Ello Antonio de Lebrija or Nebrisa (1444–1524), better known as Nebrisensis, one of the most important leaders in the revival of learning in Spain, the tutor of Queen Isabella, and a collaborator with Cardinal Jimenez in the preparation of the Complutensian Polyglot (see ALCALA DE HENARES).

LE BRUN, CHARLES (1616–1699), French painter, was born at Paris on the 24th of February 1616, and attracted the notice of Chancellor Séguier, who placed him at the age of eleven in the studio of Vouet. At fifteen he received commissions from Cardinal Richelieu, in the execution of which he displayed an ability which obtained the generous commendations of Poussin, in whose company Le Brun started for Rome in 1642. In Rome he remained four years in the receipt of a pension due to the liberality of the chancellor. On his return to Paris Le Brun found numerous patrons, of whom Superintendent Fouquet was the most important. Employed at Vaux le Vicomte, Le Brun introduced the Sevillian manner, and with Colbert against Fouquet. Colbert also promptly recognized Le Brun's powers of organization, and attached him to his interests. Together they founded the Academy of Painting and Sculpture (1648), and the Academy of France at Rome (1666), and gave a new development to the industrial arts. In 1660 they established the Gobelins, which at first was a great school for the manufacture, not of tapestries only, but of every class of furniture required in the royal palaces. Commanding the industrial arts through the Gobelins—of which he was director— and the whole artist world through the Academy—in which he successively held every post—Le Brun imprinted his own character on all that was produced in France during his lifetime, and gave a direction to the national tendencies which endured after his death. The nature of his emphatic and pompous talent was in harmony with the taste of the king, who, full of admiration at the decorations designed by Le Brun for his triumphal entry into Paris (1660), commissioned him to execute
a series of subjects from the history of Alexander. The first of these, "Alexander and the Family of Darius," so delighted Louis XIV. that he at once ennobled Le Brun (December, 1662), who was also created first painter to his majesty with a pension of 12,000 livres, the same amount as he had yearly received in the service of the magnificent Fouquet. From this date all that was done in the royal palaces was directed by Le Brun. The works of the gallery of Apollo in the Louvre were interrupted in 1677 when he accompanied the king to Flanders (on his return from Lille he painted several compositions in the Château of St Germaines), and finally—for they remained unfinished at his death—by the vast labours of Versailles, where he reserved for himself the Halls of War and Peace, the Ambassadors' Staircase, and the Great Gallery, other artists being forced to accept the position of his assistants. At the death of Colbert, Louis XIV. succeeded him in the department of public works, showed no favour to Le Brun, and in spite of the king's continued support he felt a bitter change in his position. This contributed to the illness which on the 22nd of February 1690 ended his death in the Galerie. Besides his gigantic labours at Versailles and the Louvre, the number of his works for religious corporations and private patrons is enormous. He modelled and engraved with much facility, and, in spite of the heaviness and poverty of drawing and colour, his extraordinary activity and the vigour of his conceptions justify his claim to fame. Nearly all his compositions have been reproduced by celebrated engravers.

LEBRUN, CHARLES FRANÇOIS, due de Plaisance (1737—1814), French statesman, was born at St-Sauveur-Lendelin (Nançay) on the 9th of March 1729, and in 1752 made his first appearance as a lawyer at Paris. He filled the posts successively of censeur royal (1766) and of inspector general of the domains of the crown (1768); he was also one of the chief advisers of the chancellor Maupou, took part in his struggle against the parlements, and shared in his downfall in 1774. He then devoted himself to literature, translating Tasso's Gerusalemme liberata (1774), and the Iliad (1776). At the outset of the Revolution he foresaw its importance, and in the Voix du citoyen, which he published in 1789, predicted the course which events would take. In the Constituent Assembly, where he sat as deputy for Douard, he professed liberal views, and was the proposer of various financial laws. He then became president of the directory of Seine-et-Oise, and in 1795 was elected as a deputy to the National Convention. He was appointed minister of the interior under Brumaire in the year VIII. (6th November 1799), Le Brun was made third consul. In this capacity he took an active part in the reorganization of finance and of the administration of the departments of France. In 1804 he was appointed arch-treasurer of the empire, and in 1805-1806 as governor-general of Liguria effected its annexation to France. He opposed Napoleon's restoration of the noblesse, and in 1808 only reluctantly accepted the title of due de Plaisance (Placenza). He was next employed in organizing the departments which were formed in Holland, of which he was governor-general from 1811 to 1813. Although to a certain extent opposed to the despotism of the emperor, he was not in favour of his deposition, though he accepted the Jour de l'Empire in April 1814. Louis XVIII. made him a peer of France; but during the Hundred Days he accepted from Napoleon the post of Grand Master of the university. On the return of the Bourbons in 1815 he was consequently suspended from the House of Peers, but was recalled in 1819. He died at St Mesmes (Seine-et-Oise) on the 16th of June 1824. He had been made a member of the Académie des Inscriptions et Belles-Lettres in 1803.

See M. de Caumont la Force, L'Architecte au Louvre (Paris, 1867); M. Marie du Mesnil, Memoire sur le prince Le Brun, due de Plaisance (Paris, 1825); Opinions, rapports et discours d'Orléans de C. F. Le Brun (1829), edited, with a biographical notice, by his son Anne-Charles Lebrun.

LEBRUN, PIERRE ANTOINE (1785—1873). French poet, was born in Paris on the 29th of November 1785. An Ode à la grande armée, mistaken at the time for the work of Écouchard Lebrun, attracted Napoleon's attention, and secured for the author a pension of 1,200 francs. Lebrun's plays, once famous, are now forgotten. They are: Ulysse (1814), Marie Stuart (1820), which obtained a great success, and Le Cid d'Andalouise (1825). Lebrun visited Greece in 1820, and on his return to Paris he published in 1822 an ode on the death of Napoleon which cost him his pension. In 1825 he was guest of Sir Walter Scott at Abbotsford. The coronation of Charles X. in that year inspired the verses entitled La Vallée de Champaussay, which have, perhaps, done more to secure his fame than his more ambitious attempts. In 1828 appeared his most important poem, La Grèce, and in the same year he was elected to the Academy. The revolution of 1830 opened up to him a public career; in 1831 he was made director of the Impératrice Royale, and subsequently filled with distinction other public offices, becoming senator in 1853. He died on the 27th of May 1873.

LEBRUN, PONCÉ DENIS ÉCOUCHARD (1729—1807). French lyric poet, was born in Paris on the 11th of August 1729, in the house of the prince de Conti, to whom his father was valet. Young Lebrun had among his schoolfellows a son of Louis raceine whose disciple he became. In 1755 he published an Ode sur les désastres de Lisbon (1759) he married Marie Anée de Surcouf, addressed in his Élogies as Fanny. To the early years of his marriage belong his poems Nature. His wife suffered much from his violent temper, and when in 1774 she brought an action against him to obtain a separation, she was supported by Lebrun's own mother and sister. He had been sécrétaire (1792, 1798) and member of the École du chant de Charles Laron (1819). He died in Paris on the 21st of March 1819. The author of this memoir found in 1830 the papers and notes of Lebrun, with which was connected more than a life of fortune in the loss of his capital by the bankruptcy of the prince of Guéméné. To this period belongs a long poem, the Veillées des Muses, which remained unfinished, and his ode to Buffon, which ranks among his best works. Dependent on government pensions he changed his politics with the times. Calonne he compared to the great Sully, and Louis XVI. to Henry IV., but the Terror nevertheless found in him its official poet. He occupied rooms in the Louvre, and fulfilled his obligations by shameless attacks on the unfortunate king and queen. His excellent ode on the Vengeur and the Ode nationale contre Anglere on the occasion of the projected invasion of England are in honour of the power of Napoleon. His "versatility" was an advantage in the position in which it is difficult to appreciate his real merit. He had a genius for epigram, the quatrains and dizaines directed against his many enemies have a vive generally lacking in his odes. The one directed against La Harpe is called by Sainte-Beuve the "queen of epigrams." La Harpe has said that the poet, called by his friends, perhaps with a spice of irony, Lebrun-Pindare, had written many fine strophes but not one good ode. The critic exposed mercilessly the obscurities and unlucky images which occur even in the ode to Buffon, and advised the author to imitate the simplicity and energy that adorned Buffon's prose. Lebrun died in Paris on the 31st of August 1807. His works were published by his friend P. L. Gignéne in 1811. The best of them are included in Prosper Poëtine's "Petits poètes français," which forms part of the "Panthéon littéraire."

LE CARON, HENRI (whose real name was Thomas MILLER BEECH) (1841—1894). British secret service agent, was born at Colchester, on the 26th of September 1841. He was of an adventurous character, and when nineteen years old went to Paris, where he found employment in business connected with America. Infected with the excitement of the American Civil War and the desire to strike for the North, he joined the army, taking the name of Henri Le Caron. In 1864 he married a young lady who had helped him to escape from some Confederate marauders; and by the end of the war he was to be major. In 1865, through a companion in arms named O'Neill, he was brought into contact with Fenianism, and having learnt of the Fenian plot against Canada, he mentioned the designs when writing home to his father. Mr Beach told his local M.P., who in turn told the Home Secretary, and the latter asked Mr Beach to arrange for further information. Le Caron, inspired (as all the evidence shows) by genuinely patriotic feeling, from that
time till 1889 acted for the British government as a paid military spy. He was proficient in medicine, among other qualifications for this post, and he remained for years on intimate terms with the most extreme men in the Fenian organization under all its forms. His services enabled the British government to take measures which led to the fiasco of the Canadian invasion of 1870 and Riel's surrender in 1871, and he supplied full details concerning the various Irish-American associations, in which he himself was a prominent member. He was in the secrets of the "new departure" in 1879-1881, and in the latter year had an interview with Parnell at the House of Commons, when the Irish leader spoke sympathetically of an armed revolution in Ireland. For twenty-five years he lived at Detroit and other places in America, paying occasional visits to Europe, and all the time carrying his life in his hand. The Parnell Commission of 1889 put an end to this. Le Caron was subcomissioned by The Times, and in the witness-box the whole story came out, all the efforts of Sir Charles Russell in cross-examination failing to shake his testimony, or to impair the impression of iron tenacity and absolute truthfulness which his hearing conveyed. His career, however, for good or evil, was at an end. He published the story of his life, Twenty-five Years in the Secret Service, and it had an immense circulation. But he had to be constantly guarded, his acquaintances were hampered from seeing him, and he was the victim of a painful disease, of which he died on the 1st of April 1894. The report of the Parnell Commission is his monument.

LE CATEAU, or CATEAU-CAMBRÉSIS, a town of northern France, in the department of Nord, on the Selle, 15 m. E.S.E. of Cambrai by road. Pop. (1906) 10,400. A church of the early 12th century and a town-hall in the Renaissance style are its chief buildings. Its institutions include a board of trade-arbitration and a communal college, and its most important industries are wool-spinning and weaving. Formed by the union of the two villages of Péronne and Vendelgies, under the protection of a castle built by the bishop of Cambrai, Le Cateau became the seat of an abbey in the 11th century. In the 15th it was frequently taken and retaken, and in 1556 it was burned by the French, who in 1559 signed a celebrated treaty with Spain in the town. It was finally ceded to France by the peace of Nijmegen in 1678.

LECCO (anc. Lupiae), a town and archiepiscopal see of Apulia, Italy, capital of the province of Lecco, 24 m. S.E. of Brindisi by rail. Pop. (1906) 35,179. The town is remarkable for the number of buildings of the 12th and 13th centuries, of which it contains; among these are the cathedral of S. Oronzo, and the churches of S. Chiara, S. Croce, S. Domenico, &c., the Seminario, and the Prefettura (the latter contains a museum, with a collection of Greek vases, &c.). Buildings of an earlier period are not numerous, but the fine portal of the Romanesque church of SS. Nicola e Cataldo, built by Tancred in 1180, may be noted. Another old church is S. Maria di Cerrate, near the town. Lecco contains a large government tobacco factory, and is the centre of a fertile agricultural district. To the E. 7½ m. is the small harbour of S. Cataldo, reached by electric tramway. Lecco is quite close to the site of the ancient Lupiae, equidistant (25 m.) from Brundusium and Hydryndrum, remains of which are mentioned as existing up to the 7th century. A colony was founded there in Roman times, and Hadrian made a harbour—no doubt at S. Cataldo. Hardly a mile west of Rudiae, the birthplace of the poet Ennius, spoken of by Silius Italicus as worthy of mention for that reason alone. Its site was marked by the now deserted village of Rugge. The name Lycea, or Lycia, begins to appear in the 6th century. The city was for some time held by counts of Norman blood, among whom the most noteworthy is Bohemond, son of Robert Guiscard. It afterwards passed to the Orsini. The rank of provincial capital was bestowed by Ferdinand of Aragon in acknowledgment of the fidelity of Lecco to his cause.

LECO, a town of Lombardy, in the province of Como, 32 m. by rail N. by E. of Milan, and reached by steamer from Como, 673 ft. above sea-level. Pop. (1901) 10,352. It is situated near the southern extremity of the eastern branch of the Lake of Como, which is frequently distinguished as the Lake of Lecco. At Lecco begins the line (run by electricity) to Colico, whence there are branches to Chiavenna and Sondrio; and another line runs to Bergamo. To the south the Adda is crossed by a fine bridge originally constructed in 1335, and rebuilt in 1609 by Fuentes. Lecco, in spite of its antiquity, presents a modern appearance, almost the only old building being its castle, of which a part remains. Its schools are particularly good. Besides iron-works, there are copper-works, brass-foundries, olive-oil mills and a manufacture of wax candles; and silk-spinning, cotton-spinning and wood-carving. In the neighbourhood is the villa of Calceotto, the residence of Alessandro Manzoni, who in his Promessi Sposi has left a full description of the district.

A statue has been erected to him.

In the 11th century Lecco, previously the seat of a marquisate, was presented to the bishops of Como by Otto II.; but in the 12th century it passed to the archbishops of Milan, and in 1127 it assisted the Milanese in the destruction of Como. During the 13th century it was struggling for its existence with the metropolitan city; and its fate seemed to be sealed when the Visconti drove its inhabitants across the lake to Valmadrera, and forbade them to raise their town from its ashes. But in a few years the people returned; Azzone Visconti made Lecco a strong fortress, and in 1355 united it with the Milanese territory by a bridge across the Adda. During the 15th and 16th centuries the citadel of Lecco was an object of endless contention. In 1647 the town with its territory was made a countship. Morone, Charles V.'s Italian chancellor, was born in Lecco.

LECH (Licus), a river of Germany in the kingdom of Bavaria, 177 m. long, with a drainage basin of 2550 sq. m. It rises in the Vorarlberg Alps, at an altitude of 6120 ft. It winds out of the gloomy limestone mountains, flows in a north-north-easterly direction, and enters the plains at Füssen (2580 ft.), where it forms rapids and a fall, then pursues a northerly course past Augsburg, where it receives the Wertach, and joins the Danube from the right just below Donauwörth (1330 ft.). It is not navigable, owing to its torrential character and the gravel beds which choke its channel. More than once great historic events have been decided upon its banks. On the Lechfield, a stony waste some miles long, between the Lech and the Wertach, the emperor Otto I. defeated the Hungarians in August 955. Tilly, in his retreat from Vienna, was defeated by the forces of Gustavus Adolphus, was fatally wounded, on the 5th of April 1632. The river was formerly the boundary between Bavaria and Swabia.

LE CHAMBIAN, or LE CHAMBIAN-FEUGEROLLES, a town of east-central France in the department of Loire, 7½ m. S.W. of St. Etienne by rail, on the Ondaine, a tributary of the Loire. Pop. (1906) town, 7525; commune, 12,011. Coal is mined in the neighbourhood, and there are forges, steel works, manufactures of tools and other iron goods, and silk mills. The feudal castle of Feugerolles is a hill to the south-east dates in part from the 11th century.

Between Le Chambon and St. Etienne is La Ricamarie (pop. of town 5280) also of Importance for its coal-mines. Many of the galleries of a number of the mines are on fire, probably from spontaneous combustion. According to popular tradition these fires date from the time of the Saracens; more authentically from the 15th century.

LE CHAPELIER, ISAAC RENÉ GUY (1754-1794), French politician, was born at Rennes on the 12th of June 1754, his father being bâtonnier of the corporation of lawyers in that town. He entered his father's profession, and had some success as an orator. In 1780 he was elected as a deputy to the States General by the Tiers-État of the sénéchaussée of Rennes. He adopted advanced opinions, and was one of the founders of the Breton Club (see Jacobin Club); his influence in the Constituent Assembly was considerable, and on the 3rd of August 1789 he was elected its president. Thus he presided over the Assembly
during the important period following the 4th of August, he took an active part in the debates, and was a leading member of the committee which drew up the new constitution; he further presented a report on the liberty of theatres and on literary copyright. He was also conspicuous as opposing Robespierre when he proposed that members of the Constituent Assembly should not be eligible for election to the proposed new Assembly. After the flight of the king to Varennes (20th of June 1792), his opinions became more moderate, and on the 29th of September he brought forward a motion to restrict the action of the clubs. This, together with a visit which he paid to England in 1792 made him suspect, and he was denounced on his return for conspiring with foreign nations. He went into hiding, but was discovered in consequence of a pamphlet which he published to defend himself, arrested and condemned to death by the Revolutionary Tribunal. He was executed at Paris on the 22nd of April 1794.

LECKY, GOTTHARD VICTOR (1811-1888), German Lutheran theologian, was born on the 18th of April 1811 at Kloster Reichenbach in Württemberg. He studied at Tübingen under F. C. Baur, and became in 1838 pastor of the church of St Thomas, professor ordinarius of historical theology and superintendent of the Lutheran church of Leipzig. He died on the 26th of December 1888. A disciple of Neander, he belonged to the extreme right of the school of mediating theologians. He is important as the historian of early Christianity and of the pre-Reformation period. Although F. C. Baur was his teacher, he did not attach himself to the Tübingen school; in reply to the contention that there are traces of a sharp conflict between two parties, Paulinists and Petrinists, he says that "we find variety coupled with agreement, and unity with difference, between Paul and the earlier apostles; we recognize the 'one spirit' in the many gifts." His Das apostolische und das nachapostolische Zeitalter (1841), which developed out of a prize essay (1839), passed through three editions in Germany (3rd ed., 1883), and was translated into English (2 vols., 1886). The work which in his own opinion was his greatest, Johann von Wiclif und die Vorgeschichte der Reformation (2 vols., 1873), appeared in English with the title John Wyclif and his English Precursors (1878, new ed., 1884). An earlier work, Geschichte des engl. Deutsms (1841), is still regarded as a valuable contribution to the study of religious thought in England.

Lecky’s other works include Geschichte der Presbyterian- und Synodalen (1849); Urkunden-Zeitablauf zur Geschicht des christl. Altertums (1886), and biographies of Thomas Brudwarde (1862) and Robert Grosseteste (1867). He wrote part of the commentary on the Acts of the Apostles in J. P. Lange’s Bibelwerk. From 1862 he edited with F. W. Dibelius the Beiträge zur lüctischen Kirchengeschichte. Johannes Hhus (1890) was published after his death.

LECKY, WILLIAM EDWARD HARTPOLE (1838-1903), Irish historian and publicist, was born at Newtown Park, near Dublin, on the 26th of March 1838, being the eldest son of John Hartpole Lecky, whose family had for many generations been landowners in Ireland. He was educated at Kingstown, Armagh, and Cheltenham College, and at Trinity College, Dublin, where he graduated B.A. in 1859 and M.A. in 1863, and where, with a view to becoming a clergyman in the Irish Protestant Church, he went through a course of divinity. In 1860 he published anonymously a small book entitled The Religious Tendencies of the Age, but on leaving college he abandoned his first intention and turned to historical work. In 1861 he published Leaders of Public Opinion in Ireland, a brief sketch of the life and work of Swift, Flood, Grattan and O’Connell, which gave decided promise of his later admirable work in the same field. This book, originally published anonymously, was republished in 1871; and the essay on Swift, rewritten and amplified, appeared again in 1897 as an introduction to a new edition of Swift’s works. Two learned surveys of certain aspects of history followed: A History of the Rise and Influence of Rationalism in Europe (2 vols., 1865), and A History of European Morals from Augustus to Charlemagne (2 vols., 1869). Some criticism was aroused by these books, especially by the last named, with its opening dissertation on "the natural history of morals," but both have been generally accepted as acute and suggestive commentaries upon a wide range of facts. Lecky then devoted himself to the chief work of his life, A History of England during the Eighteenth Century, vols. i. and ii. of which appeared in 1878, and vols. vii. and viii. (completing the work) in 1880. His object was "to disengage from the great mass of facts those which relate to the permanent forces of the nation, or which indicate the carrying out of this task Lecky displays many of the qualities of a great historian. The work is distinguished by the lucidity of its style, but the fulness and extent of the authorities referred to, and, above all, by the judicial impartiality maintained by the author throughout. These qualities are perhaps most conspicuous and most valuable in the chapters which deal with the history of Ireland, and in the cabinet edition of 1892, in 12 vols. (frequently reprinted) this part of the work is separated from the rest, and occupies five volumes under the title of A History of Ireland in the Eighteenth Century. A volume of Poems, published in 1891, was characterized by a certain frugidity and by occasional lapses into commonplace, objections which may also be fairly urged against much of Lecky’s prose-writing. In 1896 he published two volumes entitled Democracy and Liberty, in which he considered, with special reference to Great Britain, France and America, some of the tendencies of modern democracies. The somewhat gloomy conclusions at which he arrived provoked much criticism both in Great Britain and America, which was renewed when he published in a new edition (1899) an elaborate and very depreciatory estimate of Gladstone, then recently dead. This book, though essentially different from the author’s purely historical writings, has many of their merits, though it was inevitable that other minds should take a different view of the evidence. In The Map of Life (1900) he discussed in a popular style some of the ethical problems which arise in everyday life. In 1903 he published a revised and greatly enlarged edition of Leaders of Public Opinion in Ireland, in two volumes, from which the essay on Swift was omitted and that on O’Connell was expanded into a complete biography of the great advocate of repeal of the Union. Though always a keen sympathizer with the Irish people in their misfortunes and aspirations, and though he had criticized severely the methods by which the Act of Union was passed, Lecky, who grew up as a moderate Liberal, was from the first strenuously opposed to Gladstone’s policy of Home Rule, and in 1885 he was returned to parliament as Unionist member for Dublin University. In 1897 he was made a privy councillor, and among the coronation honours in 1902 he was nominated an original member of the new Order of Merit. His university honours included the degree of L.L.D. from Dublin, St Andrews and Glasgow, the degree of D.C.L. from Oxford and the degree of Litt.D. from Cambridge. In 1894 he was elected corresponding member of the Institute of France. He contributed occasionally to periodical literature, and two of his addresses, The Political Value of History (1892) and The Empire, its Value and its Growth (1903), were published. He died in London on the 22nd of October 1903.

Le Clerc, Jean (1657-1736), French Protestant divinity, was born on the 30th of March 1657, at Geneva, where his father, Stephen Le Clerc, was professor of Greek. The family originally belonged to the neighbourhood of Beauvais, and several of its members acquired some name in literature. Jean Le Clerc applied himself to the study of philosophy under J. R. Chouet (1642-1731) the Cartesian, and attended the theological lectures of P. Mestrezat, Franz Turrretin and Louis Tronchin (1629-1705). In 1678-1769 he spent some
time at Grenoble as a tutor in a private family, on whose return to Geneva he passed his examinations and received ordination. Soon after, he went to Shannon, where in 1760 he published Liberii de Sancto Amore Epistolae Theologicae (Irenopolis: Typis Philalethianis), usually attributed to him; they deal with the doctrine of the Trinity, the hypostatic union of the two natures in Jesus Christ, original sin, and the like, in a manner sufficiently far removed from that of the conventional orthodoxy of the period. In 1682 he went to London, where he remained six months, preaching on alternate Sundays in the Wallon church and in the Savoy chapel. Passing to Amsterdam he was introduced to John Locke and to Philip v. Limborch, professor at the Remonstrant college; the acquaintance with Limborch soon ripened into a close friendship, which strengthened his preference for the Remonstrant theology, already favourably known to him by the writings of his grand-uncle, Stephan Cureelauze (d. 1645) and by those of Simon Episcopius. A last attempt to live at Geneva, made at the request of relatives there, satisfied him that the theological atmosphere was ungenial, and in 1684 he finally settled at Amsterdam, first as a moderately successful bookseller, and afterwards as a professor of philosophy, belles-lettres and Hebrew in the Remonstrant seminary. This appointment, which he owed to Limborch, he held from 1684, and in 1712 on the death of his friend he was called to occupy the chair of church history also. His suspected Socinianism was the cause, it is said, of his exclusion from the chair of dogmatic theology. Apart from his literary labours, Le Clerc's life at Amsterdam was eventful. In 1697 he married a daughter of Gregorio Leti. From 1728 onward he was subject to repeated strokes of paralysis, and he died on the 5th of January 1736.

The full catalogue of the publications of Le Clerc will be found, with biographical material, in L. and E. Haag's France Protestant (where seventy-three works are enumerated), or in J. G. de Chauffe-pie's Dictionnaire. Only the most important of these can be mentioned here. In 1685 he published Sentiments de quelques theologiens de Hollande sur l'histoire critique du Vieux Testament composés par le P. Richard Simon, in which, while pointing out what he believed to be the faults of that author, he undertook to make some positive contributions towards a right understanding of the Bible. Among these last may be noted his argument against the Mosaic authorship of the Pentateuch, his views as to the manner in which the five books were composed, his opinions (singularly free for the time in which he lived) on the subject of inspiration in general, and particularly the inspiration of prophecy, his attempt to solve the problems of the pouring over of the Canticles. Richard Simon's Réponse (1686) elicited from Le Clerc a Défense des sentimens in the same year, which was followed by a new Réponse (1687). In 1692 appeared his Logica sive Ars Ratioeandi, and his Physiologia, or the Science of the Human Body, which, with the Physiologia, are incorporated with the Opera Philosophica, which have passed through several editions. In 1693 his series of Biblical commentaries began with that on Genesis; the series was not completed until 1731; in the portion relating to the New Testament books included the paraphrase and notes of Henry Hammond (1605-1660). Le Clerc's commentary had a great influence in breaking up traditional prejudices and showing the necessity for a more scientific inquiry into the origin and meaning of the Biblical books. It was on all sides hotly attacked. His Ars Critica appeared in 1668, and, in continuation, Epitomae Criticae et Ecclesiasticæ in 1700. Le Clerc's new edition of the Apostolic Fathers of Johann Caspar Gottsched (1700) was published in 1730, and was incorporated in the critical study of these documents. But the greatest literary influence of Le Clerc was probably that which he exercised over his contemporaries by means of the serials, or if one may so call them, which he established and edited, the first and the best of these was the Journal universelle et historique (Amsterdam, 25 vols. 12 mo., 1668-1693), begun with J. C. de la Croze; the Bibliothèque choisie (Amsterdam, 28 vols., 1703-1715); and the Bibliothèque ancienne et moderne, 23 vols. (1715-1747.)

See Le Clerc's Pârissiana ou pensées sur des matières de critique, d'histoire, de morale, et de politique: avec la défense de divers ouvrages de M. L. P. de Théodore Perrase (Amsterdam, 1699); and Vita et opera ad annum MDCCCL., amis ejus opuscula, philosophici Opuscula, de la Description, etc. (Amsterdam, 1798), a supplement to Hammond's was translated into English in 1699.) Pârissiana, or Thoughts on Several Subjects, in 1700, the Harmony of the Gospels in 1701, and Twelve Dissertations on M. D. 1729, was published in 1731. It was the first of a series of works which Le Clerc produced in large numbers, and which have left a lasting mark on the history of French literature. Among his most important works were his Opera Philosophica, a treatise on the nature of God and the universe, and his Denonstrationes (Amsterdam, 1700), a work on the nature of the universe and the existence of God. Le Clerc's chief contribution to the history of philosophy was his defense of the principle of the unity of the human soul, and his attempt to establish a new system of metaphysics. He was a great advocate of the philosophy of the ancients, and his works on the subject were among the most important of the time. He also wrote extensively on the history of the Church, and his works on the subject are still read with interest today.

Le Clerc's influence extended far beyond France, and he was a great figure in the intellectual life of Europe. He was a great admirer of Locke, and his works on the nature of the soul and the universe were among the most important of the time. He was also a great advocate of the philosophy of the ancients, and his works on the subject were among the most important of the time. He also wrote extensively on the history of the Church, and his works on the subject are still read with interest today.

Le Clerc's music was of a classical tradition, and he was a great admirer of the works of Bach and Mozart. He was a great advocate of the philosophy of the ancients, and his works on the subject were among the most important of the time. He also wrote extensively on the history of the Church, and his works on the subject are still read with interest today.

Evidences, and Its Relation to Religious Thought (1888). He was president of the American Association for the Advancement of Science in 1862, and of the Geological Society of America in 1866. He died in the Yosemite Valley, California, on the 6th of June 1901.

LECONTE DE LISLE, CHARLES MARIE RENÉ (1818-1894), French poet, was born in the island of Réunion on the 22nd of October 1818. His father, an army surgeon, who brought him up with great severity, sent him to travel in the East Indies with a view to preparing him for a commercial life. After this voyage he went to Rennes to complete his education, studying especially Greek, Italian and history. He returned home or twice to Réunion, but in 1840 settled definitely in Paris. His first volume, La Vénus de Milo, attracted him a number of friends many of whom were passionately devoted to classical literature. In 1833 he was made assistant librarian at the Louvain Library; in 1836 he was elected to the Academy in succession to Victor Hugo. His Poèmes antiques appeared in 1832; Poèmes et poésies in 1834; Le Chemin de la croix in 1839; the Poèmes barbares, in their first form, in 1862; Les Erinnyes, a tragedy after the Greek model, in 1872; for which occasional music was provided by Jules Massenet; the Poèmes tragiques in 1884; L’Apolлонide, another classical tragedy, in 1888; and two posthumous volumes, Derniers poèmes et lettres intimes in 1902. In addition to his original work in verse, he published a series of admirable prose translations of Theocritus, Homer, Hesiod, Aeschylus, Sophocles, Euripides, Horace. He died at Voisins, near Louveciennes (Seine-et-Oise), on the 18th of July 1894.

In Leconte de Lisle the Parnassian movement seems to crystallize. His verse is clear, sonorous, dignified, deliberate in movement, classically correct in rhythm, full of exotic local colour, of savage names, of real-life tragedy. It has its own kind of romance, in its "legend of the ages," so different from Hugo's, so much fuller of scholarship and the historic sense, yet with far less of human pity. Coldness cultivated as a kind of artistic distinction seems to turn all his poetry to marble, in spite of the fire at its heart. Most of Leconte de Lisle's poems are little chill epics, in which legend is fossilized. They have the lofty monotony of a single conception of life and of the universe. He seems the world as what Byron called it, "a glorious blunder," and desires only to stand a little apart from the throng, meditating sorrowfully. Hope, with him, becomes no more than this desperate certainty:—

"Tu te tairas, ô voix sinistre des vivants!"

His only prayer is to Death, "divine Death," that it may gather its children to its breast:—

"Affranchis-nous du temps, du nombre et de l'espace,
Et rendons-nous le repos que la vie a troublé!"

The interval which is his he accepts with something of the defiance of his own Cain, refusing to fill it with the triviality of happiness, waiting even upon beauty with a certain inflexible austerity. He never had and would have none of the success, so much implied, so great tragic passions, languid with fire in the East, a tumultuous conflagration in the middle ages, a sombre darkness in the heroic ages of the North. The burning emptiness of the desert attracts him, the inexplicable melancholy of the dogs that bark at the moon; he would interpret the jaguar's dreams, the sleep of the condor. He sees nature with the same wrathful impatience as man, praising it for its destructive energies, its haste to crush out human life before the stars fall into chaos, and the world with them, as one of the least of stars. He sings the "Dies Irae" exultingly; only seeming to desire an end of God as well as of man, universal nothingness. He conceives that he does well to be angry, and this anger is indeed the personal note of his pessimism; but it leaves him somewhat apart from the philosophical poets, too fierce for wisdom and not rapturous enough for poetry.

LE COQ, ROBERT (d. 1373). French bishop, was born at Montdidolt, although he belonged to a bourgeois family of Orléans, where he first attended school before coming to Paris. In Paris he became advocate to the parlement (1347); then King John appointed him master of requests, and in 1351, a year during which he received many other honours, he became bishop of Laon. At the opening of 1354 he was sent with the cardinal of Boulogne, Pierre I, duke of Bourbon, and Jean VI, count of Vendome, to Mantes to treat with Charles the Bad, king of Navarre, who had caused the constable, Charles of Spain, to be assassinated, and from this time dates his connexion with this king. At the meeting of the estates which opened in Paris in October 1356 Le Coq played a leading rôle and was one of the most outspoken of the orators, especially when petitions were presented to the dauphin Charles, denouncing the bad government of the realm and demanding the banishment of the royal councillors. Soon, however, the credit of the estates having gone down, he withdrew to his diocese, but at the request of the bourgeois of Paris he speedily returned. The king of Navarre had succeeded in escaping from prison and had entered Paris, where his party was in the ascendant; and Robert le Coq became the most powerful person in his council. No one dared to contradict him, and he brought into it whom he pleased. He did not scruple to reveal to the king of Navarre secret deliberations, but his fortune soon turned. He ran great danger at the estates of Compiègne in May 1358, when his dismissal was demanded, and he had to flee to St Denis, where Charles the Bad and Etienne Marcel came to find him. After the death of Marcel, he tried, unsuccessfully, to deliver Laon, his episcopal town, to the king of Navarre, and he was excluded from the amnesty promised in the treaty of Calais (1360) by King John to the partisans of Charles of Navarre. He had not only been banished, and he was obliged to flee from France. In 1363, thanks to the support of the king of Navarre, he was given the bishopric of Calahorra in the kingdom of Aragon, which he administered until his death in 1373.

LECOUVREUR, ADRIENNE (1662-1730), French actress, was born on the 5th of April 1692, at Damery, Marne, the daughter of a hatter, Robert Courvreur. She had an unhappy childhood in Paris. She showed a natural talent for declamation and was instructed by La Grand, sociétaire of the Comédie Française, and with her help she obtained a provincial engagement. It was not until 1717, after a long apprenticeship, that she made her Paris début as Electre, in Crébillon’s tragedy of that name, and Angélique in Grétry’s Die uferlosen Schiffbrüche. Her success was so great that she was immediately received into the Comédie Française, and for thirteen years she was the queen of tragedy there, attaining a popularity never before accorded an actress. She is said to have played no fewer than 1184 times in a hundred rôles, of which she created twenty-two. She owed her success largely to her courage in abandoning the stilted style of elocution of her predecessors for a naturalness of delivery and a touching simplicity of pathos that delighted and moved her public. In Baron, who returned to the stage at the age of sixty-seven, she had an able and powerful coadjutor in changing the stage traditions of generations. The jealousy she aroused was partly due to her social successes, which were many, in spite of the notorious freedom of her manner of life. She was on visiting and dining terms with half the court, and her salon was frequented by Voltaire and all the other notables and men of letters. She was the mistress of Maurice de Saxe, and sold her plate and jewels to supply him with funds for his ill-starred adventures as duke of Courland. By him she had a daughter, her third, who was grandmother of...
the father of George Sand. Adrienne LeCouvre died on the 20th of March 1730. She was denied the last rites of the Church, and her remains were refused burial in consecrated ground. Voltaire, in a fine poem on her death, expressed his indignation at the barbarous treatment accorded to the woman whose "friend, admirer, lover" he was. Her life formed the subject of the well-known tragedy (1849), by Eugène Scribe and Ernest Legouvé.

**LE CREUSOT**, a town of east-central France in the department of Saône-et-Loire, 55 m. S.W. of Dijon on the Paris- Lyon railway. Pop. (1906), town, 22,535; commune, 33,437. Situated at the foot of lofty hills in a district rich in coal and iron, it has the most extensive iron works in France. The coal bed of Le Creusot was discovered in the 13th century; but it was not till 1774 that the first workshops were founded there. The royal crystal works were transferred from Sèvres to Le Creusot in 1787, but this industry came to an end in 1831. Meanwhile two or three enterprises for the manufacture of metal had ended in failure, and it was only in 1836 that the foundation of iron works by Adolphe and Eugène Schneider definitely inaugurated the industrial prosperity of the place. The works supplied large quantities of war material to the French armies during the Crimean and Franco-German wars. Since that time they have continuously enlarged the scope of their operations, which now embrace the manufacture of steel, armour-plate, guns, ordnance-stores, locomotives, electrical machinery and engineering material of every description. A net-work of railways about 37 m. in length connects the various branches of the works with each other and with the neighbouring Canal du Centre. Special attention is paid to the welfare of the workers, who, not including the miners, number about 12,000, and have formed a union.

In 1807 the manufacture of the Société des Forges et Chantiers de la Méditerranée at Havre was acquired by the Company, which also has important branches at Chalon-sur-Saône, where ship-building and bridge-construction is carried on, and at Cette (Hérault).

**LECTERN** (through O. Fr. lectur, from Late Lat. lecturm, or lectinium, legere, to read; the French equivalent is lutrin; Ital. leggio; Ger. Lesepult), in the furniture of certain Christian churches, a reading-desk, used more especially for the reading of the lessons in the and in the Church practically confined to that purpose. In the early Christian Church this was done from the ambo (q.v.), but in the 15th century, when the books were often of great size, it became necessary to provide a lectern to hold them. Such lecterns were either in wood or metal, and many fine examples still exist; one, De Gregorio in wood, in which there are shelves on all four sides to hold books, is perhaps the most elaborate. Brass lecterns, as in the colleges of Oxford and Cambridge, are common; in the usual type the book is supported on the outspread wings of an eagle or pelican, which is raised on a moulded stem, carried on three projecting ledges or feet with lions on them. In the example in Norwich cathedral, the pelican supporting the book stands on a rock enclosed with a rich cresting of Gothic tabernacle work; the central stem or pillar, on which this rests, is supported by miniature projecting buttresses, standing on a moulded base with lions on it.

**LECTION, LECTIONARY.** The custom of reading the books of Moses in the synagogues on the Sabbath day was a very ancient one in the Jewish Church. The addition of lections (i.e. readings) from the prophetic books had been made afterwards and was in existence in our Lord's time, as may be gathered from such passages as St Luke iv. 16-20, xvi. 29. This element in synagogue worship was taken over with others into the Christian divine service, additions being made to it from the writings of the apostles and evangelists. We find traces of such additions within the New Testament itself in such directions as are contained in Col. iv. 16; 1 Thess. v. 27.

From the 3rd century onwards references multiply, though the earlier references do not prove the existence of a fixed lectionary or order of lessons, but rather point the other way. Justin Martyr, describing divine worship in the middle of the 2nd century says: "On the day called Sunday all who live in cities or in the country gather together to one place, and the memoirs of the Apostles, or the writings of the Prophets are read as long as time permits" (Apol. l. cap. 67). Tertullian half a century later makes frequent reference to the reading of Holy Scripture in public worship (Apol. 39; De praeractis. 36; De ammis. 9).

In the canons of Hippolytus in the first half of the 3rd century we find this direction: "Let presbyters, subdeacons and readers, and all the people assemble daily in the church at time of cock-crow, and betake themselves to prayers, to psalms and to the reading of the Scriptures, according to the command of the Apostles, until I come attend to reading" (canon xx).

But there are traces of fixed lessons coming into existence in the course of this century; Origen refers to the book of Job being read in Holy Week (Commentaries on Job, lib. i.). Allusions of a similar kind in the 4th century are frequent. John Cassian (c. 380) tells us that throughout Egypt the Psalms were divided into groups of twelve, and that after each group there followed two lessons, one from the Old, one from the New Testament (De caenob. inst. ii. 4), implying but not absolutely stating that there was a fixed order of such lessons just as there was of the Psalms. St Basil the Great mentions fixed lessons on certain occasions taken from Isaiah, Proverbs, St Matthew and Acts (Hom. xiii. De bapt.). From Chrysostom (Hom. liii. in Act. &c.), and Augustine (Tract. vi. in Joann. &c.) we learn that Genesis was read in Lent, Job and Jonah in Passion Week, the Acts of the Apostles in Eastertide, lessons on the Passion on Good Friday and on the Resurrection on Easter Day. In the Apostolical Constitutions (ii. 57) the following service is described and enjoined. First come two lessons from the Old Testament, a reading of the Gospels being made use of except the books of the Apocrypha. The Psalms of David are then to be sung. Next the Acts of the Apostles and the Epistles of Paul are to be read, and finally the four Gospels by a deacon or a priest. Whether the selections were _ad libitum_ or according to a fixed table of lessons we are not informed. Nothing in the shape of a lectionary is extant older than the 8th century, though there is evidence that Claudianus Marmecus made one for the church at Vienne in 450, and that Museus made one for the church at Marseilles c. 458. The Liber comitis formerly attributed to St Jerome must be three, or nearly three, centuries later than that saint, and the Luxeuil lectionary, or _Lectionarium Gallicanum_, which Mabillon attributed to the 7th, cannot be earlier than the 8th century; yet the oldest MSS. of the Gospels have marginal marks, and sometimes actual interpolations, which are usually accounted for as indicating the beginnings and endings of liturgical lessons. The third council of Carthage in 397 forbade anything but Holy Scripture to be read in church; this rule has been adhered to so far as the liturgical epistle and gospel, and occasional additional lessons in the Roman missal are concerned, but in the divine office, on feasts when nine lessons are read at matins, only the first three lessons are taken from Holy Scripture, the next three being taken from the sermons of ecclesiastical writers, and the last three from expositions of the day's gospel; but sometimes the lives or _Passions_ of the saints, or of some particular saints, were substituted for any or all of these breviary lessons.

(F. E. W.)

**LECTISTERNIUM** (Lat. lectum stiensae, "to spread a couch"; _strapulion_ in Dion. Halic. xii. 9), in ancient Rome, a proprietary ceremony, consisting of a meal offered to gods and goddesses, represented by their busts or statues, or by portable figures of wood, with heads of bronze, wax or marble, and covered with drapery. Another suggestion is that the symbols of the gods consisted of bundles of sacred herbs, tied together in the form of a head, covered by a waxen mask so as to resemble a kind of bust (cf. the straw puppets called _Argei_). These symbols were laid upon a couch (_lectus_), the left arm resting on a cushion (_pulvinum_, whence the couch itself was often called _pulvinar_) in the attitude of reclining. In front of the couch, which was placed in the open street, a meal was set out on a table. It is definitely stated by Livy (v. 13) that the ceremony took place "for the first time" in Rome in the year...
LECTOR—LE DAIM

399 B.C., after the Sibylline books had been consulted by their keepers and interpreters (daumuri sacis faciendis), on the occasion of a pestilence. Three couches were prepared for three pairs of gods—Apollo and Latona, Hercules and Diana, Mercury and Neptune. The feast, which on that occasion lasted for eight (or seven) days, was also celebrated by private individuals; the citizens kept open house, quarrels were forgotten, debtors and prisoners were released, and everything done to banish sorrow. Similar honours were paid to other deities in subsequent times—Fortuna, Saturnus, Juno Regina of the Aventine, the three Capitoline deities (Jupiter, Júno, Minerva), and in 217, after the defeat of lake Trasimenus, a lectisternium was held for three days to six pairs of gods, corresponding to the twelve great gods of Olympus—Jupiter, Juno, Neptune, Minerva, Mars, Venus, Apollo, Diana, Vulcan, Vesta, Mercury, Ceres. In 205, alarmed by unfavourable prodigies, the Romans were ordered to fetch the Great Mother of the gods from Pessinus in Phrygia; in the following year the image was brought to Rome, and a lectisternium held. In later times, the lectisternium became of constant (even daily) occurrence, and was celebrated in the different temples. Such celebrations must be distinguished from those which were ordered, like the earlier lectisternia, by the Sibylline books in special emergencies. Although undoubtedly offerings of food were made to the gods in very early Roman times on such occasions as the ceremony of confarreatio, and the epulum Jovis (often confounded with the lectisternium), it is generally agreed that the lectisternia were of Greek origin.

In favour of this may be mentioned: the similarity of the Greek ὀκτώεστα, in which, however, the gods played the part of hosts; the gods associated with it were either previously unknown to Roman religion, though often concealed under Roman names, or were provided with a new cult (thus Hercules was not worshipped as at the Ara Maxima, where, according to Servius on Aeneid, viii. 176 and Cornelius Balbus, ap. Macrobius, Sat. iii. 6, a lectisternium was forbidden); the decisions whether a lectisternium was to be held or not, were of Greek origin; the custom of reclining at meals was Greek. Some, however, assign an Etruscan origin to the ceremony, the Sibylline books themselves being looked upon as old Italian "black books." A probable explanation of the confusion between the lectisternia and genuine old Italian ceremonies is that, as the lectisternia became an almost everyday occurrence in Rome, people forgot their foreign origin and the circumstances in which they were first introduced, and then the word pulvinar with its associations was transferred to times in which it had no existence. In imperial times, according to Tacitus (Annales, xv. 44), chairs were substituted for couches in the case of goddesses, and the lectisternium in their case became a sellisternium (the reading, however, is not certain). This was in accordance with Roman custom, since in the earliest times all the members of a family sat at meals, and in later times at least the women and children. This was the original practice at the lectisternium and the epulum Jovis, the goddesses at the latter being provided with chairs, whereas in the lectisternium they reclined. In Christian times the word was used for a feast in memory of the dead (Sidonius Apollinaris, Epistulae, iv. 15).

LECTOR, or READER, a minor office-bearer in the Christian Church. From an early period men have been set apart, under the title of magistri, lectoris, or readers, for the purpose of reading Holy Scripture in church. We do not know what the custom of the Church was in the first two centuries, the earliest reference to readers, as an order, occurring in the writings of Tertullian (De praescriptione haeret. cap. 41): "There are frequent allusions to them in the writings of St Cyprian and afterwards."

Cornelius, bishop of Rome in A.D. 251-252, in a well-known letter mentions readers among the various church orders then existing at Rome. In the Apostolic Church Order (canon 19), mention is made of the qualifications and duties of a reader, but no reference is made to their method of ordination. In the Apostolic Didascalia there is recognition of three minor orders of men, deacons, readers and singers, in addition to two orders of women, deaconesses and widows. A century later, in the Apostolic Constitutions, we find not only a recognition of readers, but also a form of admission provided for them, consisting of the imposition of hands and prayer (lib. viii. cap. 22). In Africa the imposition of hands was not in use, but a Bible was handed to the newly appointed reader with words of commission to read it, followed by a prayer and a benediction (Fourth Council of Carthage, can. 8). This is the ritual of the Roman Church of to-day. With regard to age, the novels of Justinian (No. 123) forbade any one to be admitted to the office of reader under the age of eighteen.

( F. E. W.)

LECTOURE, a town of south-western France, capital of an arrondissement in the department of Gers, 21 m. N. of Auch on the Southern railway between that city and Agen. Pop. (1906), town, 2426; commune, 4310. It stands on the right bank of the Gers, overlooking the river from the summit of a steep plateau. The church of St Gervais and St Protas was once a cathedral. The massive tower which flanks it on the north belongs to the 15th century; the rest of the church dates from the 13th, 15th, 16th and 17th centuries. The hôtel de ville, the sous-préfecture and the museum occupy the palace of the former bishops, which was once the property of Marshall Jean Lannes, a native of the town. A recess in the wall of an old house contains the Fontaine de Houdélie, a spring sheltered by a double archway of the 13th century. At the bottom of the hill a church of the 10th century marks the site of the monastery of St Géry. Lectoure has a tribunal of first instance and a communal college. Its industries include distilling, the manufacture of wooden shoes and biscuits, and market gardening; it has trade in grain, cattle, wine, and brandy.

Lector, capital of the Iberian tribe of the Lectorates and for a short time of Novempopulania, became the seat of a bishopric in the 4th century. In the 11th century the counts of Lomagne made it their capital, and on the union of Lomagne with Armagnac, in 1245, it became the capital of the counts of Armagnac. In 1473 Cardinal Jean de Jouffroy besieged the town on behalf of Louis XI. and after its fall put the whole population to the sword. In 1562 it again suffered severely at the hands of the Catholics under Blaise de Montluc.

LEDA, in Greek mythology, daughter of Thustes, king of Aetolia, and Eurythemsis (her parentage is variously given). She was the wife of Tyndareus and mother of Castor and Pollux, Clytemnestra and Helen (see CASTOR and POLLUX). In another account Memes was the mother of Helen (p.e.) whom Leda adopted as her daughter. This led to the identification of Leda and Memes. In the usual later form of the story, Leda herself, having been visited by Zeus in the form of a swan, produced two eggs, from one of which came Helen, from the other Castor and Pollux.

Lecapelladorus iii. 10; Hyginus, Fab. 77; Homer, Iliad, iii. 426,Od. xi. 298; Euripides, Helen, 17; Isocrates, Helena, 59; Ovid, Heroides, xvii. 55; Horace, Ars poetica, 147; Statius in Aeneid iii. 344; for the representations of Leda and the swan—art. A. D. Overbeck, Kunstchronik, i. 340, Atlas to the same; also article in Roscher's Lexicon der Mythologie.

LE DAIM (or LE DAIM), OLIVIER, d. (1484), favourite of Louis XI. of France, was born of humble parentage at Thiet near Courtrai in Flanders. Seeking his fortune at Paris, he became court barber and valet to Louis XI., and so ingratiated himself with the king that in 1474 he was ennobled under the title Le Daim and in 1477 made comte de Meulan. In the latter year he was sent to Burgundy to influence the young heirs of Charles the Bold, but he was ridiculed and compelled to leave Ghent. He thereupon seized and held Tournai for the French. Le Daim had considerable talent for intrigue, and, according to his enemies, could always be depended upon to execute the baser designs of the king. He amassed a large fortune, largely by oppression and violence, and was named gentleman-in-waiting, captain of Loches, and governor of Saint-Quentin. He remained in favour until the death of Louis XI., when the rebellious lords were able to avenge the slights and insults they had suffered at
the hands of the royal barber. He was arrested on charges, the nature of which is uncertain, tried before the parlement of Paris, and on the 21st of May 1484 hanged at Montfaucon without the knowledge of Charles VIII, who might have heeded his father's request and spared the favourite. Le Daim's property was given to the duke of Orleans.

See the memoirs of the time, especially those of Ph. de Commines (ed. Mândrot, 1901-1903, Eng. trans. in Bohn Library); Robt. Gaguin, Compendium de origine et gestis Francorum (Paris, 1856); it was Gaguin who made the celebrated epigram concerning Le Daim: "Eras judex, lector, et exitium"; De Reiffenberg, Olivier le Dain (Brussels, 1829); Delasalle, Le Barbier de Louis XI. (Paris, 1832); G. Picot, "Proces d'Olivier le Dain," in the Comptes rendus de l'Académie de l'histoire des Sciences, 1875, p. 536-537. The memoirs of the time are uniformly hostile to Le Daim.

LEDUBURY, a market town in the Ross parliamentary division of Herefordshire, England, 143 m. E. of Hereford by the Great Western railway, pleasantly situated on the south-western slope of the Malvern Hills. Pop. of urban district (1901) 3259. Cider and agricultural produce are the chief articles of trade, and there are limestone quarries in the neighbouring hills. The town contains many picturesque examples of timbered houses, characteristic of the district, the principal being the Market House, on the site of a Norman one. The corps of the church of St Michael exhibits all the Gothic styles, the most noteworthy features being the Norman chancel and west door, and the remarkable series of ornate Decorated windows on the north side. Among several charities is the hospital of St Catherine, founded by Foliot, bishop of Hereford, in 1232. Hope End, 2 m. N.E. of Ledbury, was the residence of Elizabeth Barrett Browning during her early life. A clock-tower in the town commemorates her.

Wall Hills Camp, supposed to be of British origin, is the earliest evidence of a settlement near Ledbury (Lieveldes, Ledbury). The town was not incorporated, but was early called a borough; and in 1295 and 1304-1309, two members to parliament. A fair on the day of the decollation of John the Baptist was granted to the bishop in 1249. Of fairs which survived in 1792 those of the days of St Philip and St James and St Barnabas were granted in 1534-1535; those held on the Monday before Easter and St Thomas' day were reputed ancient, but not those of the 12th of May, the 22nd of June, the 2nd of October and the 21st of December. Existing fairs are on the second Tuesday in every month and in October, a weekly fair. The archbishop, John and Henry III, was obsoleto in 1584-1585, when the present market of Tuesday was authorized. The wool trade was considerable in the 14th century; later Ledbury was inhabited by gloves and clothiers. The town was an important station on the operations of the Civil Wars, being occupied both by the royalist leader Prince Rupert and by the Parliamentary Colonel Birch.

LEDGER (from the English dialect forms liggen or leggen, to lie or lay; in sense adapted from the Dutch substantive legger), properly a book remaining regularly in one place, and so used of the copies of the Scriptures and service books kept in a church. The New English Dictionary gives from Chaucer Wrothley's Chronicle, 1358 (ed. Camden Soc., 1875, by W. D. Hamilton), "the curates should provide a booke of the biblike in Englishe, of the largest volume, to be a ligder in the same church for the parishioners to read on." It is an application of this original meaning that is found in the commercial usage of the term for the principal book of account in a business house (see BOOK-KEEPING). Apart from these applications to various forms of books, the word is used of the horizontal timbers in a scaffold (q.v.) lying parallel to the face of a building, which support the "put logs"; of a flat stone to cover a grave; and of a stationary form of tackle and bait in angling. In the form "ligger" the term was formerly frequently applied to a "resident," as distinguished from an "extraordinary" ambassador.

LEDOWSKI, MICIESLAUS JOHANN, COUNT (1822-1902), Polish cardinal, was born on the 21st of October 1822 in Gorki Ruskiego, Russia. He received his education at the gymnasium and seminary of Warsaw. After finishing his studies at the Jesuit Accademia dei Nobili Ecclesiastici in Rome, which strongly influenced his religious development and his attitude towards church affairs, he was ordained in 1845. From 1856 to 1858 he represented the Roman See in Columbia, but on the outbreak of the Colombian revolution had to return to Rome. In 1861 Pope Pius IX. made him his nuncio at Brussels, and in 1865 he was made archbishop of Gnesen-Posen. His preconization followed on the 8th of January 1866. This date marks the beginning of the second period in Ledochowski's life; for during the Prussian and German Kulturkampf he was one of the most declared enemies of the state. It was only during the earliest years of his appointment as archbishop that he entertained a different view, invoking, for instance, an intervention of Prussia in favour of the Roman Church, when it was oppressed by the house of Savoy. On the 12th of December 1870 he presented an effective memorandum on the subject at the headquarters at Versailles. In 1872 the archbishop protested against the demand of the government that religious teaching should be given only in the German language, and in 1873 he addressed a circular letter on this subject to the clergy of his diocese. The government thereupon demanded a statement from the teachers of religion as to whether they intended to obey it or the archbishop, and on their declaring for the archbishop, dismissed them. The count himself was called upon at the end of 1873 to lay aside his office. On his refusing to do so, he was arrested between 3 and 4 o'clock in the morning on the 3rd of February 1874 by Stahidi, the director of police, and taken to the military prison of Ostrowo. The pope made him a cardinal on the 13th of March, but it was not till the 3rd of February 1876 that he was released from prison. Having been expelled from the eastern provinces of Prussia, he betook himself to Cracow, where his presence was made the pretext for anti-Prussian demonstrations. Upon this he was also expelled from Austria, and went to Rome, whence, in spite of his removal from office, which was decreed on the 15th of April 1874, he continued to direct the affairs of his diocese, for which he was on several occasions from 1877 to 1879 condemned in absentia by the Prussian government for "usurpation ofoffice," and dismisses his diocese. The pope, ledochowski refused to resign his archbishopric, in which he was succeeded by Dinder at the end of 1884. Ledochowski's return in 1884 was forbidden by the Prussian government (although the Kulturkampf had now abated), on account of his having stirred up anew the Polish nationalist agitation. He passed the closing years of his life in Rome. In 1892 he became prefect of the Congregation of the Propaganda, and he died in Rome on the 22nd of July 1902.

(1902-1903); Briick, Geschichte der katholischen Kirche in Deutschland im neunzehnten Jahrhundert, vol. 4 (1901 and 1908); Lauchert, Biographisches Jahrbuch, vol. 7 (1905) (H. Jns.).

LEDRO-ROLLIN, ALEXANDRE AUGUSTE (1807-1874), French politician, was the grandson of Nicolas Philippe Ledru, the celebrated quack doctor known as "Comus" under Louis XIV., and was born in a house that was once Scarron's, at Fontcoyal-roues (Seine), on the 2nd of February 1807. He had just begun to practise at the Parisian bar before the revolution of July, and was retained for the Republican defence in most of the great political trials of the next ten years. In 1838 he bought for 330,000 francs Desiré Dalliez's place in the Court of Cassation. He was elected deputy for Le Mans in 1841 with hardly a dissentient voice; but for the violence of his electoral speeches he was tried at Angers and sentenced to four months' imprisonment and a fine, against which he appealed successfully on a technical point. He made a rich and romantic marriage in 1843, and in 1846 disposed of his charge at the Court of Cassation to give his time entirely to politics. He was now the recognized leader of the working-men of France. He had more authority in the country than in the Chamber, where the violence of his oratory diminished its effect. He asserted that the "fortifications of Paris were directed against liberty, not against foreign invasion, and he stigmatized the law of regency (1842) as an audacious usurpation. Neither from official Liberalism nor from the press did he receive support; even the Republican National was
opposed to him because of his championship of labour. He therefore founded La Réforme in which to advance his propaganda. Between Ledru-Rollin and Odilon Barrot with the other chiefs of the “dynastic Left” there were acute differences, hardly dissimulated even during the temporary alliance which produced the campaign of the banquet. It was the speeches of Ledru-Rollin and Louis Blanc at working-men’s banquets in Lille, Dijon and Châlons that really heralded the revolution. Ledru-Rollin prevented the appointment of the duchess of Orleans as regent in 1848. He and Lamartine held the tribune in the Chamber of Deputies until the Parisian populace stopped serious discussion by invading the Chamber. He was minister of the interior in the provisional government, and was also a member of the executive committee appointed by the Constituent Assembly, from which Louis Blanc and the extremists were excluded. At the crisis of the 15th of May he solemnly sided with Lamartine and the party of order against the proletariat. Henceforward his position was a difficult one. He never regained his influence with the working classes, who considered they had been betrayed; but to his short ministry belongs the credit of the establishment of a working system of universal suffrage. At the presidential election in December he was put forward as the Socialist candidate, but secured only 370,000 votes. His opposition to the policy of President Louis Napoleon, especially his Roman policy, led to his moving the impeachment of the president and his ministers. The motion was defeated, and next day (June 13, 1849) he headed what he called a peaceful demonstration, and his enemies armed insurrection. He himself escaped to London where he joined the executive of the revolutionary committee of Europe, with Kosuth and Mazzini among his colleagues. He was accused of complicity in an obscure attempt (1857) against the life of Napoleon III. and condemned in his absence to deportation. Emile Ollivier removed the exceptions from the general amnesty in 1870, and Ledru-Rollin returned to France after twenty years of exile. Though elected in 1871 in three departments he refused to sit in the National Assembly, and took no serious part in politics until 1874 when he was returned to the Assembly as member for Vaucouleurs. He died on the 31st of December of that year.

Under Louis Philippe he made large contributions to French jurisprudence, editing the Journal du palais, 1791-1837 (27 vols., 1837), and 1837-1847 (17 vols.), with a commentary Répertoire général de droit public (8 vols., 1851), the title-page of which was written by himself. His later writings were political in character. See Ledru-Rollin, ses discours et ses écrits politiques (2 vols., Paris, 1879), edited by his widow.

LEDYARD, JOHN (1751-1780), American traveller, was born in Groton, Connecticut, U.S.A. After vainly trying law and theology, Ledyard adopted a sea man’s life, and, coming to London, was engaged as corporal of marines by Captain Cook for his third voyage (1776). On his return (1778) Ledyard had to give up to the Admiralty his copious journals, but afterwards published, from memory, a meagre narrative of his experiences—herein giving the only account of Cook’s death by an eye-witness (Hartford, U.S.A., 1783). He continued in the British service till 1782, when he escaped, off Long Island. In 1784 he revisited Europe, to organize an expedition to the American North-West. Having failed in his attempts, he decided to reach his goal by travelling across Europe and Asia. Baffled in his hopes of crossing the Baltic on the ice (Stockholm to Abo), he walked right round from Stockholm to St Petersburg, where he arrived barefoot and penniless (March 1787). Here he made friends with Pallas and others, and accompanied Dr Brown, a Scotch physician in the Russian service, to Siberia. Ledyard left Dr Brown at Barnaul, went on to Tomsk and Irkutsk, visited Lake Baikal, and descended the Lena to Yakutsk (18th of September 1787). With Captain Joseph Billings, whom he had known on Cook’s Resolution, he returned to Irkutsk, where he was arrested, deposed, banished from the front, and imprisoned for ever. Reaching London, he was engaged by Sir Joseph Banks and the African Association to explore overland routes from Alexandria to the Niger, but in Cairo he succumbed to a dose of vitriol (17th of January 1789). Though a born explorer, little resulted from his immense but ill-directed activities.

See Memoirs of the Life and Travels of John Ledyard, by Jared Sparks (1828).

LEDYARD, ANN (1736-1784), English religious visionary, was born in Manchester, where she was first a factory hand and afterwards a cook. She is remembered by her connexion with the sect known as Shakers (q.v.). She died at Watervilet, near Albany, New York.

LEE, ARTHUR (1740-1792), American diplomatist, brother of Richard Henry Lee, was born at Stratford, Westmoreland county, Virginia, on the 20th of December 1740. He was educated at Eton, studied medicine at Edinburgh, practised as a physician in Williamsburg, Virginia, read law at the Temple, London, in 1766-1770, and practised law in London in 1770-1776. He was an intimate of John Wilkes, whom he aided in one of his London campaigns. In 1775-1776 he served as London agent for Massachusetts, second to Benjamin Franklin, whom he succeeded in 1775. At that time he had shown great ability as a pamphleteer, having published in London The Monitor (1768), seven essays previously printed in Virginia; The Political Detection: or the Treachery and Tyranny of Administration, both at Home and Abroad (1770), signed “Junius Americanus”; and An Appeal to the Justice and Interests of the People of Great Britain in the Present Disputes with America (1774), signed “An Old Member of Parliament.” In December 1775 the Committee of Secret Correspondence of Congress chose him its European agent principally for the purpose of ascertaining the views of France, Spain, and other European countries regarding the war between the colonies and Great Britain. In October 1776 he was appointed, upon the refusal of Jefferson, on the commission with Franklin and Silas Deane to negotiate a treaty of alliance, amity and commerce with France, and also to negotiate with other European governments. His letters to Congress, in which he expressed his suspicion of Deane’s business integrity and criticized his accounts, resulted in Deane’s recall; and other letters impaired the confidence of Congress in Franklin, whom he was especially jealous. Early in 1777 he went to Spain as American commissioner, but received no official recognition, was not permitted to proceed farther than Burgos, and accomplished nothing; until the appointment of Jay, however, he continued to act as commissioner to Spain, held various conferences with the Spanish minister in Paris, and in January 1778 secured a promise of a loan of 6,000,000 livres, of which only a small part of which (some 170,000 livres) was paid. In June 1777 he went to Berlin, where, as in Spain, he was not officially recognized. Although he had little to do with the negotiations, he signed with Franklin and Deane in February 1778 the treaties between the United States and France. Having become unpopular at the courts of France and Spain, Lee was recalled in 1779, and returned to the United States in September 1780. He was a member of the Virginia House of Delegates in 1781 and a delegate to the Continental Congress in 1782-1783. With Oliver Wolcott and Richard Butler he negotiated a treaty with the Six Nations, signed at Fort Stanwix on the 22nd of October 1784, and with George Clark and Richard Butler a treaty with the Wyandot, Delaware, Chippewa and Ottawa Indians, signed at Ft. McIntosh on the 21st of January 1788. He was member of the treaty board of 1786-1788. He strongly opposed the constitution, and after its adoption retired to his estate at Urbana, Virginia, where he died on the 12th of December 1822.

See R. H. Lee, Life of Arthur Lee (2 vols., Boston, 1829), and C. H. Lee, A Vindication of Arthur Lee (Richmond, Virginia, 1894), both partisan. Much of Lee’s correspondence is to be found in Wharton’s Correspondence and Documents of Washington (Washington, 1880).

PITTSBURGH, American cavalry general, was born at Clermont, in Fairfax county, Virginia, on the 19th of November 1835. He was the grandson of “Light Horse Harry” Lee, and the nephew of Robert E. Lee. His father, Sydney Smith Lee, was a fleet captain under Commodore Perry in Japanese waters and rose to the rank of commodore; his
mother was a daughter of George Mason. Graduating from West Point in 1856, he was appointed to the 2nd Cavalry, which was commanded by Colonel Albert Sidney Johnston, and in which his uncle, Robert E. Lee, was lieutenant-colonel. As a cavalry subaltern he distinguished himself by his gallant conduct in actions with the Comanches in Texas, and was severely wounded in 1859. In May 1860 he was appointed instructor of cavalry at West Point, but resigned on the secession of Virginia. Lee was at once employed in the organization of the forces of the South, and served at first as a staff officer to General R. S. Ewell, and afterwards, from September 1861, as lieutenant-colonel, and from April 1862 as colonel of the First Virginia Cavalry in the Army of Northern Virginia. He became brigadier-general on General J. E. B. Stuart's recommendation on the 25th of July 1862, and served under that general throughout the Virginia campaigns of 1862 and 1863, becoming major-general on the 3rd of September 1863. He conducted the cavalry action of Beverley Ford (17th March 1863) with skill and success. In the Wilderness and Petersburg campaigns he was constantly employed as a divisional commander under Stuart, and, after Stuart's death, under General Wade Hampton. He took part in Early's campaign against Sheridan in the Shenandoah Valley, and at Winchester (19th Sept. 1864) three horses were shot under him and he was severely wounded. On General Hampton's being sent to assist General Joseph E. Johnston in North Carolina, the command of the whole of General Lee's cavalry devolved upon Fitzhugh Lee early in 1865, but the surrender of Appomattox followed quickly upon the opening of the campaign. Fitzhugh Lee himself led the last charge of the Confederates on the 9th of April that year at Farmville.

After the war he devoted himself to farming in Stafford county, Virginia, and was conspicuous in his efforts to reconcile the Southern people to the issue of the war, which he regarded as a final settlement of the questions at issue. In 1875 he attended the Bunker Hill centenary at Boston, Mass., and delivered a remarkable address. In 1885 he was a member of the board of visitors of West Point, and from 1886 to 1890 was governor of Virginia. In April 1896 he was appointed by President Cleveland consul-general at Havana, with duties of a diplomatic and military character added to the usual consular business. In this post (in which he was retained by President McKinley) he was from the first called upon to deal with a situation of great difficulty, which culminated with the destruction of the “Maine” (see Spanish-American War). Upon the declaration of war between Spain and the United States he re-entered the army. He was one of the three ex-Confederate general officers who were made major-generals of United States Volunteers. Fitzhugh Lee commanded the VII. army corps, but took no part in the actual operations in Cuba. He was military governor of Havana and Pinar del Rio in 1899, subsequently commanded the department of the Missouri, and retired as a brigadier-general U.S. Army in 1901. He died in Washington on the 28th of April 1905. He wrote Robert E. Lee (1894) in the "Great Commanders" series, and Cuba's Struggle Against Spain (1899).

LEE, GEORGE ALEXANDER (1802-1851), English musician, was born in London, the son of Henry Lee, a pupil-guitar and inkeeper. He became "tiger" to Lord Barrymore, and his singing led to his being educated for the musical profession. After appearing as a tenor at the theatres in Dublin and London, he joined in producing opera at the Tottenham Street theatre in 1829, and afterwards was connected with musical productions at Drury Lane and Covent Garden. He married Mrs Waylett, a popular singer. Lee composed music for a number of plays, and also many songs, including the popular "Come where the Aspens quiver," and for a short time had a music-selling business in the Quadrant. He died on the 8th of October 1851.

LEE, HENRY (1756-1818). American general, called "Light Horse Harry," was born near Dumfries, Virginia, on the 29th of January 1756. His father was first cousin to Richard Henry Lee. With a view to a legal career he graduated (1773) at Princeton, but soon afterwards, on the outbreak of the War of Independence, he became an officer in the patriot forces. He served with great distinction under Washington, and in 1778 was promoted major and given the command of a small irregular corps, with which he won a great reputation as a leader of light troops. His services on the outpost line of the army earned for him the sobriquet of "Light Horse Harry." His greatest exploit was the brilliant surprise of Paulus Hook, N.J., on the 10th of August 1779; for this feat he received a gold medal, a reward given to no other officer below general's rank in the whole war. He was promoted lieutenant-colonel 1780, and sent with a picked corps of dragoons to the southern theatre of war. Here he rendered invaluable services in victory and defeat, notably at Guilford Court House, Camden and Eutaw Springs. He was present at Cornwallis's surrender at Yorktown, and afterwards left the army owing to ill-health. From 1786 to 1788 he was a delegate to the Confederation Congress, and in the last-named year in the Virginia convention he favoured the adoption of the Federal constitution. From 1789 to 1793 he served in the General Assembly, and from 1791 to 1794 was governor of Virginia. In 1794 Washington sent him to help in the suppression of the "Whisky Insurrection" in western Pennsylvania. A new county of Virginia was named after him during his governorship. He was a major-general in 1798-1800. From 1799 to 1801 he served in Congress. He delivered the address on the death of Washington which contained the famous phrase, "first in war, first in peace, and first in the hearts of his countrymen." Soon after the War of 1812 broke out, Lee, while helping to resist the attack of a mob on his friend, A. C. Hanson, editor of the Baltimore Federal Republican, which had opposed the war, received grave injuries, from which he never recovered. He died at the house of General Nathanael Greene on Cumberland Island, Georgia, on the 25th of March 1818.

Lee wrote valuable Memoirs of the War in the Southern Department (1812; 3rd ed., with memoir by Robert E. Lee, 1869).

LEE, JAMES PRINCE (1804-1869), English divine, was born in London on the 28th of July 1804, and was educated at St Paul's school and at Trinity College, Cambridge, where he displayed exceptional ability as a classical scholar. After taking orders in 1830 he served under Thomas Arnold at Rugby school, and in 1838 was appointed head-master of King Edward's school, Birmingham, where he had among his pupils E. W. Benson, J. B. Lightfoot and B. F. Westcott. In 1848 Lord John Russell nominated him as first bishop of the newly-constituted see of Manchester. His pedagogic manner bore somewhat irksomely on his clergy. He is best remembered for his splendid work in church extension; during his twenty-one years' tenure of the see he consecrated 130 churches. He took a foremost part in founding the Manchester free library, and bequeathed his own valuable collection of books to Owens College. He died on the 24th of December 1869.

A memorial sermon was preached by Archbishop E. W. Benson, and was published with biographical details by J. F. Wickenden and others.

LEE, NATHANIEL (c. 1653-1692), English dramatist, son of Dr Richard Lee, a Presbyterian divine, was born probably in 1653. His father was rector of Hatfield, and held many preferments under the Commonwealth. He was chaplain to General Monk, afterwards duke of Albermarle, and after the Restoration he conformed to the Church of England, abjuring his former opinions, especially his approval of Charles I's execution. Nathaniel Lee was educated at Westminster school, and at Trinity College, Cambridge, taking his B.A. degree in 1668. Coming to London under the patronage of the Duke of Buckingham, he tried to earn his living as an actor, but though he was an admirable reader, his acute stage fright made acting impossible. His earliest play, Nero, Emperor of Rome, was acted in 1675 at Drury Lane. Two tragedies written in rhymed heroic couplets, in imitation of Dryden, followed in 1676—Sophonisba, or Hannibal's Overthrow and Gloriana, or the Court of Augustus Caesar. Both are extravagant in design and treatment. Lee made his reputation in 1677 with a blank verse tragedy, The Rival Queens, or the Death of Alexander the Great. The play, which treats of the jealousy of Alexander's first wife, Roxana, for his second wife, Statira, was, in spite of much
bombast, a favourite on the English stage down to the days of Edmund Kean. Mithridates, King of Pontus (acted 1678), Thoedósis, or the Force of Love (acted 1680), Caesar Borgia (acted 1680)—an imitation of the worst blood and thunder Elizabethan tragedies—Lucius Junius Brutus, Father of His Country (acted 1681), and Constantine the Great (acted 1684) followed. The Princess of Cleve (1681) is a gross adaptation of Madame de La Fayette's exquisite novel of that name. The Massacre of Paris (published 1690) was written about this time. Lee had given offence at court by his Lucius Junius Brutus, which had been suppressed after its third representation for some lines on Tarquin's character that were taken to be a reflection on Charles II. He therefore joined with Dryden, who had already admitted him as a collaborator in an adaptation of Oedipus, in The Duke of Guise (1683), a play which directly advocated the Tory point of view. In it part of the Massacre of Paris was incorporated. Lee was now thirty years of age, and had already achieved a considerable reputation. But he had lived in the dissipated society of the earl of Rochester and his associates, and imitated their excesses. As he grew more disreputable, his patrons neglected him, and in 1684 his mind was completely unhinged. He spent five years in Bethlehem Hospital, and recovered his health. He died in a drunken fit in 1692, and was buried in St Clement Danes, Strand, on the 6th of May.

Lee's Dramatic Works were published in 1784. In spite of their extravagance, they contain many passages of great beauty.

**LEE, RICHARD HENRY** (1732-1794), American statesman and orator, was born at Stratford, in Westmoreland county, Virginia, on the 20th of January 1732, and was one of six distinguished sons of Thomas Lee (d. 1750), a descendant of an old Cavalier family, the first representative of which in America was Richard Lee, who was a member of the privy council, and early in the reign of Charles I. emigrated to Virginia. Richard H. Lee was placed under the care of a London academic education in England, and after a little time in travel, returned to Virginia in 1752. Having come into possession of a fine property left him by his father, and for several years applied himself to varied studies. When twenty-five he was appointed justice of the peace of Westmoreland county, and in the same year was chosen a member of the Virginia House of Burgesses, in which he served from 1758 to 1775. He kept a diffident silence during two sessions, his first speech being in strong opposition to slavery, which he proposed to discourage and eventually to abolish, by imposing a heavy tax on all further imports. He early allied himself with the Patriot or Whig element in Virginia, and in the years immediately preceding the War of Independence was conspicuous as an opponent of the arbitrary measures of the British ministry. In 1768, in a letter to John Dickinson of Pennsylvania, he suggested a private correspondence among the friends of liberty in the different colonies, and in 1773 he became a member of the Virginia Committee of Correspondence.

Lee was one of the delegates from Virginia to the first Continental Congress at Philadelphia in 1774, and prepared the address to the people of British America, and the second address to the people of Great Britain, which are among the most effective papers of the time. In accordance with instructions given by the Virginia House of Burgesses, Lee introduced in Congress, on the 7th of June 1776, the following famous resolutions: (1) "that these united colonies are, and of right ought to be, free and independent states, that they are absolved from all allegiance to the British crown, and that all political connexion between them and the state of Great Britain is, and ought to be, totally dissolved"; (2) "that it is expedient to take the most effectual measures for forming foreign alliances"; and (3) "that a plan of confederation be prepared and transmitted to the respective colonies for their consideration and approbation." Lee was debating the first of these resolutions for three days, Congress resolved that the further consideration of it should be postponed until the 1st of July, but that a committee should be appointed to prepare a declaration of independence. The illness of Lee's wife prevented him from being a member of that committee, but his first resolution was adopted on the 2nd of July, and the Declaration of Independence, prepared principally by Thomas Jefferson, was adopted two days later. Lee was in Congress from 1774 to 1780, and was especially prominent in connexion with foreign affairs. He was a member of the Virginia House of Delegates in 1777, 1780-1784 and 1786-1787; was in Congress again from 1784 to 1787, being president in 1784-1786; and was one of the first United States senators chosen from Virginia after the adoption of the Federal constitution.

Though strongly opposed to the adoption of that constitution, owing to what he regarded as its dangerous infringements upon the independent power of the states, he accepted the place of senator in hope of bringing about amendments, and proposed the Tenth Amendment in substantially the form in which it was adopted. He became a warm supporter of Washington's administration, and his prejudices against the constitution were largely removed by its working in practice. He retired from public life in 1792, and died at Chantilly, in Westmoreland county, on the 10th of June 1794.

See the Life (Philadelphia, 1825), by his grandson, R. H. Lee; and Letters (New York, 1910), edited by J. C. Ballagh.

His brother, William Lee (1739-1795), was a diplomatist during the War of Independence. He accompanied his brother, Arthur Lee (q.v.), to England in 1766 to engage in mercantile pursuits, joined the Wilkes faction, and in 1775 was elected an alderman of London, then a life-position. In April 1777, however, he received notice of his appointment by the Committee of Secret Correspondence in America to act with Thomas Morris as commercial agent at Nantes. He went to Paris and became involved in his brother's opposition to Franklin and Deane.

In May 1777 Congress chose William Lee commissioner to the courts of Vienna and Berlin, but he gained recognition at neither. In September 1778, however, while at Aix-la-Chapelle, he negotiated a plan of a treaty with Jean de Neuville, who had been appointed ambassador of France. Lee’s copy of this proposed treaty which, on falling into the hands of the British on the capture of Henry Laurens, the duly appointed minister to the Netherlands, led to Great Britain’s declaration of war against the Netherlands in December 1780. Lee was recalled from his mission to Vienna and Berlin in June 1779, without being required to return to America. He resigned his post as an alderman of London in January 1780, and returned to Virginia about 1784.

Another brother, Francis Lightfoot Lee (1734-1797), was a member of the Virginia House of Burgesses in 1770-1775. In 1775-1779 he was a delegate to the Continental Congress, and as such signed the Declaration of Independence. He served on the committee which drafted the Articles of Confederation, and contended that there should be no treaty of peace with Great Britain which did not grant to the United States both the right to the Newfoundland fisheries and the free navigation of the Mississippi. After retiring from Congress he served in 1780-1782 in the Virginia Senate.

**LEE, ROBERT EDWARD** (1807-1870), American soldier, general in the Confederate States army, was the youngest son of major-general Henry Lee, called “Light Horse Harry.” He was born at Stratford, Westmoreland county, Virginia, on the 19th of January 1807, and entered West Point in 1825. Graduating four years later second in his class, he was given a commission in the U.S. Engineer Corps. In 1831 he married Mary, daughter of G. W. P. Custis, the adopted son of Washington and the grandson of Mrs Washington. In 1836 he became first lieutenant, and in 1838 captain. In this rank he took part in the Mexican War, repeatedly winning distinction for conduct and bravery. He received the brevets of major for Cerro Gordo, lieu.-colonel for Contreras-Churubusco and colonel for Chapultepec. After the War he was employed in the work at Washington and Baltimore, during which time, as before the war, he resided on the great Arlington estate, near Washington, which had come to him through his wife. In 1852 he was appointed superintendent of West Point, and during his three years here he carried out many important changes in the academy. Under him.
LEE, R.—LEE, S. 363

as cadets were his son G. W. Custis Lee, his nephew, Fitzhugh Lee and J. E. B. Stuart, all of whom became general officers in the Civil War. In 1855 he was appointed as lieut.-colonel to the 2nd Cavalry, commanded by Colonel Sidney Johnston, with whom he served against the Indians of the Texas border.

In 1856, while at Arlington on leave, he was summoned to command the United States troops sent to deal with the John Brown raid on Harper's Ferry. In March 1861 he was made colonel of the 1st U.S. Cavalry; but his career in the old army ended with the secession of Virginia in the following month. Lee was strongly averse to secession, but felt obliged to conform to the action of his own state. The Federal authorities offered Lee the command of the field army about to invade the South, which he refused. Resigning his commission, he made his way to Richmond and was at once made a major-general in the Virginian forces. A few weeks later he became a brigadier-general (then the highest rank) in the Confederate service.

The military operations with which the great Civil War opened in 1861 were directed by President Davis and General Lee. Lee was personally in charge of the unsuccessful West Virginia operations in the autumn, and, having been made a full general on the 31st of August, during the winter he devoted his experience as an engineer to the fortification and general defence of the Atlantic coast. Thence, when the well-drilled Army of the Potomac was about to descend upon Richmond, he was hurriedly recalled to Richmond. General Johnston was wounded at the battle of Fair Oaks (Seven Pines) on the 31st of May 1862, and General Robert E. Lee was assigned to the command of the famous Army of Northern Virginia which for the next three years carried the rebellion on its bayonets.

Little can be said of Lee's career as a commander-in-chief that is not an integral part of the history of the Civil War. His first success was the "Seven Days' Battle" (q.v.) in which he stopped McClellan's advance; this was quickly followed up by the crushing defeat of the Federal army under Pope, the invasion of Maryland and the sanguinary and indecisive battle of the Antietam (q.v.). The year ended with another great victory at Fredericksburg (q.v.) Chancellorsville (see WILDERNESS), won against odds of two to one, and the great three days' battle of Gettysburg (q.v.), where for the first time fortune turned decisively against the Confederates, were the chief events of 1863. In the autumn Lee fought a war of manoeuvre against General Meade.

The tremendous struggle of 1864 between Lee and Grant included the battles of the Wilderness (q.v.), Spottsylvania, North Anna, Cold Harbor and the long siege of Petersburg (q.v.), in which, almost invariably, Lee was locally successful. But the steady pressure of his unrelenting opponent slowly wore down his strength, so that finally the last of his resources were called on to stave off Grant's three victories. Grant was compelled to break out of his Petersburg lines (April 1865). A series of heavy combats revealed his purpose, and Grant pursued the dwindling remnants of Lee's army to the westward. Headed off by the Federal cavalry, and pressed closely in rear by Grant's main body, General Lee had no alternative but to surrender. At Appomattox Court House, on the 9th of April, the career of the Army of Northern Virginia came to an end. Lee's farewell order was issued on the following day, and within a few weeks the Confederacy was at an end.

For a few months Lee lived quietly in Powhatan county, making his formal submission to the Federal authorities and urging on his own people acceptance of the new conditions. In August he was offered, and accepted, the presidency of Washington College, Lexington (now Washington and Lee University), a post which he occupied until his death on the 12th of October 1870. He was buried in the Chatham Churchyard.

For the events of Lee's military career briefly indicated in this notice the reader is referred to the articles AMERICAN CIVIL WAR, &c. By his achievements he won a high place among the great generals of history. Though hampered by lack of materials and by political necessities, his strategy was daring always, and he never hesitated to take the gravest risks. On the field of battle he was as energetic in attack as he was constant in defence, and his personal influence over the men whom he led was extraordinary. No student of the American Civil War can fail to notice how the influence of Lee dominated the course of the struggle, and his surpassing ability was never more conspicuously shown than in the last hopeless stages of the conflict. The personal history of Lee is lost in the history of the great crisis of America's national life; friends and foes alike acknowledged the purity of his motives, the virtues of his private life, his earnest Christianity and the unrepining loyalty with which he accepted the ruin of his party.

LEE (or LEGH) ROWLAND (d. 1543), English bishop, belonged to a Northumbrian family and was educated at Cambridge. Having entered the Church he obtained several livings owing to the favour of Cardinal Wolsey; after Wolsey's fall he rose high in the esteem of Henry VIII. and of Thomas Cromwell, serving both king and minister in the business of suppressing the monasteries, and he is said to have celebrated Henry's secret marriage with Anne Boleyn in January 1533. Whether this be so or not, Lee took part in preparing for the divorce proceedings against Catherine of Aragon, and in January 1534 he was elected bishop of Coventry and Lichfield, or Chester. He was often called, taking at his consecration the new oath to the king as head of the English Church and not seeking confirmation from the pope. As bishop he remained in Henry's personal service, endeavouring to establish the legality of his marriage with Anne, until May 1534, when he was appointed lord president of the council in the marches of Wales. At this time the Welsh marches were in a very disorderly condition. Lee acted in a stern and energetic fashion, holding courts, sentencing many offenders to death and overcoming the hostility of the English border lords. After some years of hard and successful work in this capacity, "the last survivor of the old martial prelates, fit for harness than for bishops' robes, for a court of justice than a court of theology," died at Shrewsbury in June 1543. Many letters from Lee to Cromwell are preserved in the Record Office, London; these throw much light on the bishop's career and on the lawless condition of the Welsh marches in his time.

One of his contemporaries was Edward Lee (c. 1482-1544) archbishop of York, famous for his attack on Erasmus, who replied to him in his Epistolae aliquot eruditorum virorum. Like Rowland, Edward was a useful and able counsellor of both Henry VIII and Catherine of Aragon, and was sent by the king on embassies to the emperor Charles V and to Pope Clement VII. In 1531 he became archbishop of York, but he came under suspicion as one who disliked the king's new position as head of the English Church. At Pontefract in 1536, during the Pilgrimage of Grace, the archbishop was compelled to join the rebels, but he did not sympathise with the rising and in 1539 he spoke in parliament in favour of the six articles of religion. Lee, who was the last archbishop of York to coin money, died on the 13th of September 1544.

LEE, SIDNEY (1859— ), English man of letters, was born in London on the 5th of December 1859. He was educated at the City of London school, and at Balliol College, Oxford, where he graduated in modern history in 1882. In the next year he became assistant-editor of the Dictionary of National Biography. In 1890 he was made joint-editor, and on the retirement of Sir Leslie Stephen in 1891 succeeded him as editor. He was himself a voluminous contributor to the work, writing some 800 articles, mainly on Elizabethan authors or statesmen. While he was still at Balliol he wrote two articles on Shakespeare in the Questions and Answers Series, and these were printed in the Gentleman’s Magazine, and in 1884 he published a volume Shakespeare and Stratford-on-Avon. His article on Shakespeare in the fifty-first volume (1897) of the Dictionary of National Biography formed the basis of his Life of William Shakespeare (1868), which reached its fifth edition in 1905. Mr Lee edited in 1902 the Oxford facsimile edition of the first folio of Shakespeare’s Comedies, Histories and Tragedies, followed in 1902 and 1904 by supplementary volumes giving details of extant copies, and in 1906 by a complete edition of
LEE, SOPHIA—LEECH, JOHN

Shakespeare's Works. Besides editions of English classics his works include a Life of Queen Victoria (1903), Great Englishmen of the Sixteenth Century (1904), based on his Lowell Institute lectures at Boston, Mass., in 1903, and Shakespeare and the Modern Stage (1906).

LEE, SOPHIA (1750–1844), English novelist and dramatist, daughter of John Lee (d. 1781), actor and theatrical manager, was born in London. Her first piece, The Chapter of Accidents, a one-act opera based on Diderot's Père de famille, was produced by George Colman at the Haymarket Theatre on the 5th of August 1780. The proceeds were spent in establishing a school at Bath, where Miss Lee made a home for her sisters. Her subsequent productions included The Recess, or a Tale of other Times (1783), a historical romance; and Almeida, Queen of Grenada (1796), a tragedy in blank verse; she also contributed to her sister's Canterbury Tales (1797). She died at her house near Clifton on the 13th of March 1824.

Her sister, Harriet Lee (1757–1851), published in 1786 a novel written in letters, The Errors of Innocence. Clara Lennox followed in 1797. Her chief work is the Canterbury Tales (1797–1800), a series of twelve stories which became very popular. Lord Byron dramatized one of the tales, "Krutilzer," as Werner, or the Inheritance. She died at Clifton on the 1st of August 1851.

LEE, STEPHEN DILL (1833–1908), Confederate general in the American Civil War, was of a family distinguished in the history of South Carolina, and was born at Charleston, S.C., on the 22d of September 1833. Graduating from West Point in 1854, he served for seven years in the United States army and resigned in 1861 on the secession of South Carolina. He was aide-de-camp to General Beauregard in the attack on Fort Sumter, and captain commanding a light battery in General Johnston's army later in the year 1861. Thereafter, by successive steps, each gained by distinguished conduct on the field of battle, he rose to the rank of brigadier-general in November 1862, being ordered to take command of defences at Vicksburg. He served at this place with great credit until its surrender to General Grant in July 1863, and on becoming a prisoner of war, he was immediately exchanged and promoted major-general. His regimental service had been chiefly with artillery, but he had generally worked with and at times commanded cavalry, and he was now assigned to command the troops of that arm in the south-western theatre of war. After harassing, as far as his limited numbers permitted, the advance of Sherman's column on Meridian, he took General Polk's place as commander of the department of Mississippi. In June 1864, on Hood's promotion to command the Army of Tennessee, S. D. Lee was made a lieutenant-general and assigned to command Hood's old corps in that army. He fought at Atlanta and Jonesboro and in the skirmishing and maneuvering along middle Tennessee which ended in the great crisis of Nashville and the "March to the Sea." Lee's corps accompanied Hood in the bold advance to Nashville, and fought in the battles of Franklin and Nashville, after which, in the route of the Confederate army Lee kept his troops closed up and well in hand, and for three consecutive days under the fighting record of the otherwise disintegrated army. Lee was himself wounded, but did not give up the command until an organized rearguard took over the post of danger. On recovery he joined General J. E. Johnston in North Carolina, and he surrendered with Johnston in April 1865. After the war he settled in Mississippi, which was his wife's state and during the greater part of the war his own territorial command, and devoted himself to planting. He was president of the Agricultural and Mechanical College of Mississippi from 1880 to 1899, took some part in state politics and was an active member—at the time of his death commander-in-chief—of the "United Confederate Veterans" society. He died at Vicksburg on the 28th of May 1908.

LEE, a township of Berkshire county, in western Massachusetts, U.S.A. Pop. (1900) 3596; (1905) 3072; (1910) 4106. The township is traversed by the New York, New Haven & Hartford railway, covers an area of 723 sq. m., and includes the village of Lee, 10 m. S. of Pittsfield, East Lee, adjoining it on the S.E., and South Lee, about 3 m. to the S.W. Lee and South Lee are on, and East Lee is near, the Hoosatonic river. The eastern part of the township is generally hilly, reaching a maximum altitude of about 2200 ft., and there are two considerable bodies of water—Laurel Lake in the N.W. (partly in Lenox) and Goose Pond, in the S.E. (partly in Tyringham). The region is healthy as well as beautiful, and is much frequented as a summer resort. Memorial Hall was built in memory of the soldiers from Lee who died during the Civil War. The chief manufactures are paper and wire, and from the quarries near the village of Lee is obtained an excellent quality of marble; these quarries furnished the marble for the extension of the Capitol at Washington, for St Patrick's cathedral in New York City and for the Lee High School and the Lee Public Library (1908). Lime is quarried in the township. Lee was formerly a paper-manufacturing place of great importance. The first paper mill in the township was built in South Lee in 1806, and for a time more paper was made in Lee than in any other place in the United States; the Housatonic Mill in Lee was probably the first (1867) in the United States to manufacture paper from wood pulp.

The first settlement within the present township of Lee was made in 1760. The township was formed from parts of Great Barrington and Washington, was incorporated in 1777 and was named in honour of General Charles Lee (1731-1782). In the autumn of 1786 there was an encounter near the village of East Lee between about 250 adherents of Daniel Shays (many of them from Lee township) and a body of state troops under General John Paterson, wherein the Shays contingent paraded a bogus cannon (made of a yarn beam) with such effect that the state troops fled.

LEE. (1) In O. Eng. liev-ward; cf. the pronunciation "leeward": the word appears in several Teutonic languages; cf. Dutch lijn, Dan. læ, properly a shelter or protection, chiefly used as a nautical term for that side of a ship, land, &c., which is farthest from the wind, hence a "lees shore," land under the lee of a ship, i.e. one on which the wind blows directly and which is unsheltered. A ship is said to make "leeway" when she drifts laterally away from her course. (2) A word now always used in the plural "lees," meaning debris, sediment, particularly of wine. It comes through the O. Fr. lié from a Gaulish Lat. līa, and is probably of Celtic origin.

LEECH, JOHN (1817–1864), English caricaturist, was born in London on the 29th of August 1817. His father, a native of Ireland, was the landlord of the London Coffee House on Ludgate Hill, "a man," on the testimony of those who knew him, "of fine culture, a profound Shakespearian, and a thorough gentleman." His mother was descended from the family of the famous Richard Bentley. It was from his father that Leech inherited his skill with the pencil, which he began to use at a very early age. When he was only three, he was discovered by F. R. Havergal, who called on his parents, seated on his mother's knee, drawing with much gravity. The sculptor pronounced his sketch to be wonderful, adding, "Do not let him be cramped with lessons in drawing; let his genius follow its own bent; he will astonish the world"—an advice which was strictly followed. A mail-coach, done when he was six years old, is already full of surprising vigour and variety in its galloping horses. Leech was educated at Charterhouse, where Thackeray, his lifelong friend, was his schoolfelllow, and at sixteen he began to study for the medical profession at St Bartholomew's Hospital, where he won praise for the accuracy and beauty of his anatomical drawings. He was then placed under a Mr Whittle, an eccentric practitioner, the original of "Rawkins" in Albert Smith's Adventures of Mr Ladbury, and afterwards under Dr John Cockle; but gradually the true bent of the youth's mind asserted itself, and he drifted into the artistic profession. He was eighteen when his first designs were published, a quarto of four pages, entitled Etchings and Sketchings by A. Pen, Esq., comic character
studies from the London streets. Then he drew some political lithographs, did rough sketches for Bell's Life, produced an exceedingly popular parody on Mulready's postal envelope, and, on the death of Seymour, applied unsuccessfully to illustrate the Pickwick Papers. In 1840 Lee quoted his contributions to the magazines with a series of etchings in Bentley's Miscellany, where Cruikshank had published his splendid plates to Jack Sheppard and Oliver Twist, and was illustrating Guy Fawkes in sadly feebler fashion. In company with the elder master Leech designed for the Ingoldsby Legends and Stanley Thorn, and till 1847 produced many independent series of etchings. These cannot be ranked with his best work; their technique is exceedingly imperfect; they are rudeley bitten, with the light and shade out of relation; and we never feel that they express the artist's individuality, the Richard Savage plates, for instance, being strongly reminiscent of Cruikshank, and "The Dance at Stamford Hall" of Hablot Browne. In 1847 Lee illustrated St. James in Douglas Jerrold's newly started Shilling Magazine, with plates more vigorous and accomplished than those in Bentley, but it is in subjects of a somewhat later date, and especially in those lightly etched and meant to be printed with colour, that we see the artist's best powers with the needle and the acid. Among such of his designs are four charming plates to Dickens's Christmas Carol (1844), the broadly humorous etchings in the Comic History of England (1847-1848), and the still finer illustrations to the Comic History of Rome (1852)—which last, particularly in its minor woodcuts, shows some exquisitely graceful touches, as witness the fair faces that rise from the surging water in "Cleelia and her Companions Escaping from the Etruscan Camp." Among the other etchings which deserve very special reference are those in Young Master Troublesome or Master Jacky's Holidays, and the frontispiece to Hints on Life, or How to Rise in Society (1845)—a series of minute subjects linked gracefully together by coils of smoke, illustrating the various ranks and conditions of men, one of them—the doctor by the patient's bedside—almost equally in vivacity and precision the best of Cruikshank's similar scenes. Then in the 'fifties we have the numerous etchings of sporting scenes, contributed, together with woodcuts, to the Handley Cross novels.

Turning to Lee's lithographic work, we have, in 1841, the Portraits of the Children of the Mobility, an important series dealing with the humorous and pathetic aspects of London street Arabs, which were afterwards so often and so effectively to employ the artist's pencil. Amid all the squallor which they depict, they are full of individual beauties in the delicate or touching expression of a face, in the graceful turn of a limb. The book is scarce in its original form, but in 1875 two reproductions of the outline sketches for the designs were published—a lithographic issue of the whole series, and a finer photographic transcript of six of the subjects by George Cruikshank. In 1841 appeared, as a half-page illustration of 1841, in which the added light and shade is frequently spotty and ineffective, and the lining itself has not the freedom which we find in some of Lee's other lithographs, notably in the Fly Leaves, published at the Punch office, and in the inimitable subject of the nuptial couch of the Caudles, which also appeared, in woodcut form, as a political cartoon, with Mrs Caudle, personated by Brougham, disturbing by untimely loquacity the slumber of the lord chancellor, whose haggard check rests on the woolsock for pillow.

But it was in work for the wood-engravers that Lee was most prolific and individual. Among the earlier of such designs are the illustrations to the Comic English and Latin Grammars (1839), to Written Caricatures (1841), to Hood's Comic Annual, (1842), and to Albert Smith's Wastall's Bond (1843), subjects mainly of a small vignette size, transcribed with the best skill of such woodcutters as Orrin Smith, and not, like the larger and later Punch illustrators, cut at speed by several engravers working at once on the subdivided block. It was in 1841 that Lee's connexion with Punch began, a connexion which subsisted till his death on the 20th of October 1864, and resulted in the production of the best-known and most admirable of his designs. His first contribution appeared in the issue of the 7th of August, a full-page illustration—entitled "Foreign Affairs"—of character studies from the neighbourhood of Leicester Square. His cartoons deal at first mainly with social subjects, and are rough and imperfect in execution, but gradually their method gains in power and their subjects become more distinctly political, and by 1849 the artist is strong enough to produce the splendidly humorous national personification which appears in "Disraeli Measuring the British Lion." About 1845 we have the first of that long series of half-page and quarter-page pictures of life and manners, executed with a hand as gentle as it was skilful, containing, as Ruskin has said, "admittedly the finest definition and natural history of the classes of our society, the kindest and subtlest analysis of its foibles, the tenderest flattery of its pretty and well-bred ways," which has yet appeared. In addition to his work for the weekly issue of Punch, Lee contributed largely to the Punch almanacks and pocket-books, to Once a Week from 1849 till 1862, to the Illustrated London News, where some of his largest and best sporting scenes appear, and to innumerable novels and miscellaneous volumes besides, of which it is only necessary to specify A Little Tour in Ireland (1859), which is noticeable as showing the artist's treatment of pure landscape, though it also contains some of his daintiest figure-pieces, like that of the wind-blown girl, standing on the summit of a pedestal, with the swifts darting around her and the breadth of sea beyond.

In 1862 Lee appeared to the public with a very successful exhibition of some of the most remarkable of his Punch drawings. These were enlarged by a mechanical process, and coloured in oils by the artist himself, with the assistance and under the direction of his friend J. E. Millais. Lee was a singularly industrious and indefatigable worker. Dean Hole tells us, when he was his guest, "I have known him send off from my house three finished drawings on the wood, designed, traced, and rectified, without much effort as it seemed, between breakfast and dinner. The engravings of Punch are, in technical qualities of Lee's art, his unerring precision, his unflagging vivacity in the use of the line, are seen most clearly in the first sketches for his woodcuts, and in the more finished drawings made on tracing-paper from these sketches, before the chiaroscuro was added and the designs were transcribed by the engraver. Turning to the mental qualities of his art, it would be a mistaken criticism which ranked him as a comic draughtsman. Like Hogarth he was a true humorist, a student of human life, though he observed humanity mainly in its whimsical aspects, "Hitting all he saw with shafts With gentle satire, kin to charity, That harmed not."

The earnestness and gravity of moral purpose which is so constant a note in the work of Hogarth is indeed far less characteristic of Lee, but there are touches of pathos and of tragedy in such of the Punch designs as the "Poor Man's Friend" (1845), and "General Fevers turned Introvert" (1859), and in "The Queen of the Avenue" in the first volume of Once a Week, which are sufficient to prove that more solemn powers, for which his daily work afforded no scope, lay dormant in his artist. The purity and manliness of Lee's character are impressed on his art. We find in it the exaggeration and grotesqueness, and none of the fierce political enthusiasm, of which the designs of Gillray are so full. Compared with that of his great contemporary George Cruikshank, his work is restricted both in compass of subject and in range; those were the days when the greater names among the original and the humorous and amusing artists were produced. Like Hogarth, in a different line of genius, the artist had a power of.entities of leeches, the exact definitions of which are still in need of a more complete survey. They occur in all parts of the world and are mostly aquatic, though sometimes terrestrial, in habit. The aquatic forms frequent streams, ponds and marshes, and the sea. The members of this group are always...
LEEDS, DUKE OF

leaders of the Cabal ministry, Buckingham and Arlington. His principal aim was no doubt the maintenance and increase of his own influence and party, but his ambition corresponded with definite political views. A member of the old cavalier party, a confidential friend and correspondent of the despotic Lauderdale, he desired to strengthen the executive and the royal authority. At the same time he was a keen partisan of the established church, an enemy of both Roman Catholics and dissenters, and an opponent of all toleration. In 1673 he opposed the Indulgence, supported the Test Act, and spoke against the proposal for giving relief to the dissenters. In June 1675 he signed the paper of advice drawn up by the bishops for the king, urging the rigid enforcement of the laws against the Roman Catholics, their complete banishment from the court, and the suppression of conventicles, and a bill introduced by him imposing special taxes on recusants and subjecting Roman Catholic priests to imprisonment for life was only thrown out as too lenient because it secured offenders from the charge of treason. The same year he introduced a Test Oath by which all holding office or seats in either House of Parliament were to declare resistance to the royal power a crime, and promise to abstain from all attempts to alter the government of either church or state; but this extreme measure of retrograde tovianism was successfully opposed by wiser statesmen. The king himself as a Roman Catholic secretly opposed and also doubted the wisdom and practicability of this "thorough" policy of repression. Danby therefore ordered a return from every diocese of the numbers of dissenters, both Romanist and Protestant, in order by a proof of their insignificance to remove the royal scruples. In December 1676 he issued a proclamation for the suppression of coffee-houses because of the "defamation of His Majesty's Government" which took place in them, but this was soon withdrawn. In 1677, to secure Protestantism in case of a Roman Catholic succession, he introduced a bill by which ecclesiastical patronage and the care of the royal children were entrusted to the bishops; but this measure, like the other, was thrown out. In foreign affairs Danby showed a stronger grasp of essentials. He desired to increase English trade, credit and power abroad. He was a determined enemy both to Roman influence and to French ascendency. He terminated the war with Holland in 1674, and from that time maintained a friendly correspondence with William; while in 1677, after two years of tedious negotiations, he overcame all obstacles, and in spite of James's opposition, and without the knowledge of Louis XIV., effected the marriage between William and Mary that was the germ of the Revolution and the Act of Settlement. This national policy, however, could only be pursued, and the minister could only maintain himself in power, by acquiescence in the king's personal relations with the king of France settled by the disgraceful Treaty of Dover in 1670, which included Charles's acceptance of a pension, and bound him to a policy exactly opposite to Danby's, one furthering French and Roman ascendency. Though not a number of the Cabal ministry, and in spite of his own denial, Danby must, it would seem, have known of these transactions at least before 1676. In the case of the treaty with Lauderdale alone, he consented to a treaty between Charles and Louis according to which the foreign policy of both kings was to be conducted in union, and Charles received an annual subsidy of £100,000. In 1678 Charles, taking advantage of the growing hostility to France in the nation and parliament, raised his price, and Danby by his directions demanded through Ralph Montagu (afterwards Duke of Montagu) six million livres a year (£300,000) for three years. Simultaneously Danby guided through parliament a bill for raising money for a war against France; a league was concluded with Holland, and troops were actually sent there. That Danby, in spite of these compromising transactions, remained in intention faithful to the national interests, appears clearly from the hostility with which he was still regarded by France. In 1676 he is described as

1 Chronicles of London Bridge, by R. Thomson (1827), 313, quoting Stow.

carnivorous or parasitic, and prey upon both vertebrates and invertebrates. In relation to their parasitic habit one or two suckers are always developed, the one at the anterior and the other at the posterior end of the body. In one subdivision of the leeches, the Gnathobdellidae, the mouth has three chitinous jaws which produce a triangular bite, though the action has been described as like that of a circular saw. Leeches without biting jaws possess a protrusable proboscis, and generally engulf their prey, as does the horse leech when it attacks earthworms. But some of them are also ectoparasites. The leech has been used in medicine from remote antiquity as a moderate blood-letting; and it is still so used, though more rarely than formerly. As unicled blood-letters, certain land-leeches are among the most unpleasant of parasites that can be encountered in a tropical jungle. A species of Haemadipsa of Ceylon attaches itself to the passer-by and draws blood with so little irritation that the sufferer is said to be aware of its presence only by the trickling from the wounds produced. Small leeches taken into the mouth with drinking-water may give rise to serious symptoms by attaching themselves to the fauces and neighbouring parts and thence sucking blood. The effects of these parasites have been mistaken for those of disease. All leeches are very extensile and can contract the body to a plump, pear-shaped form, or extend it to a long and worm-like shape. They frequently progress after the fashion of a "looper" caterpillar, attaching themselves alternately by the anterior and the posterior sucker. Others swim with eel-like curves through the water, while one land-leech, at any rate, moves in a gliding way like a land Planarian, and leaves, also like the Planarian, a slimy trail behind it. Leeches are usually olive green to brown in colour, darker patches and spots being scattered over a paler ground. The marine parasite leech Pontobdella is of a bright green, as is also the land-leech Trochela. The term "leech," as an old English synonym for physician, is from a Teutonic root meaning "heal," and is etymologically distinct from the name (O. Eng. lyce) of the Hirudo, though the use of the one by the other has helped to assimilate the two words.

LEEDS, THOMAS OSBORNE, 1st Duke of (1621-1712), English statesman, commonly known also by his earlier title of Earl of Danby, son of Sir Edward Osborne, Bart., of Kivetown, Yorkshire, was born in 1621. He was great-grandson of Sir Edward Osborne (d. 1591), lord mayor of London, who, according to the accepted account, while apprentice to Sir William Hewett, clothworker and lord mayor in 1589, made the fortunes of the family by leaping from London Bridge into the river and rescuing Anne (d. 1593), the daughter of his employer, whom he afterwards married. Thomas Osborne, the future lord treasurer, succeeded to the baronetcy and estates in Yorkshire on his father's death in 1647, and after unsuccessfully courting his cousin Dorothy Osborne, married Lady Bridget Bertie, daughter of the earl of Lindsey. He was introduced to public life and to court by his neighbour in Yorkshire, George, 2nd duke of Buckingham, was elected M.P. for York in 1661, and gained the first step into the councils by being named in his letter to Clarendon in 1667. In 1668 he was appointed joint treasurer of the navy with Sir Thomas Lyttelton, and subsequently sole treasurer. He succeeded Sir William Coventry as commissioner for the state treasury in 1660, and in 1673 was appointed a commissioner for the admiralty. He was created Viscount Osborne in the Scottish peerage on the 2nd of February 1673, and a privy councillor on the 3rd of May. On the 19th of June, on the resignation of Lord Clifford, he was appointed lord treasurer and made Baron Osborne of Kivetown and Viscount Lattimer in the peerage of England, while on the 27th of June 1674 he was created earl of Danby, when he surrendered his Scottish peerage of Osborne to his second son Peregrine Osborne. He was appointed the same year lord-lieutenant of the West Riding of Yorkshire, and in 1677 received the Garter.

Danby was a statesman of very different calibre from the
by Ruvigny to Louis XIV. as intensely antagonistic to France and French interests, and in doing his utmost to prevent the treaty of that year. In 1678, on the rupture of relations between Charles and Louis, a splendid opportunity was afforded Louis of paying off old scores by disclosing Danby’s participation in the king’s demands for French gold.

Every circumstance now conspired to effect his fall. Although both abroad and at home his policy had generally embodied the wishes of the ascendant party in the state, Danby had never obtained the confidence of the nation. His character inspired no respect, and he could not reckon during the whole of his long career on the support of a single individual. Charles is said to have told him when he made him treasurer that he had only two friends in the world, himself, and his own merit. He was described to Pepys on his acquiring office as “one of a broken sort of people that have not much to lose and therefore will venture all,” and as “a beggar having £100 or £1200 a year, but owes above £10,000.” His office brought him in £2,000 a year, and he was known to be making large profits by the sale of offices; he maintained his power by corruption and by jealously excluding from office men of high standing and ability. Burnet described him as “the most hated minister that had ever been about the king.” Worse men had been less detected, but Danby had none of the amiable virtues which often counteract the odium incurred by serious faults. Evelyn, who knew him intimately from his youth, describes him as “a man of excellent natural parts but nothing of generous or grateful.” Shaftesbury, doubtless no friendly witness, speaks of him as an inveterate liar, “proud, ambitious, revengeful, false, prodigal and covetous to the highest degree,” and Burnet supports his unfavourable judgment to a great extent. His corruption, his mean submission to a tyrant wife, his greed, his pale face and lean person, which had succeeded to the handsome features and comeliness of earlier days, were the subject of ridicule, from the witty sneces of Halifax to the coarse jests of the anonymous writers of innumerable lampoons. By his championship of the national policy he had raised up formidable foes abroad without securing a single friend or supporter at home, and his fidelity to the national interests was now, through a very mean and ignoble act of personal spite, to be the occasion of his downfall.

Danby in appointing a new secretary of state had preferred Sir W. Temple, a strong adherent of the anti-French policy, to Montagu. The latter, after a quarrel with the duchess of Cleveland, was dismissed from the king’s employment. He immediately went over to the opposition, and in concert with Louis XIV. and Barillon, the French ambassador, by whom he was supplied with a large sum of money, arranged a plan for effecting Danby’s ruin. He obtained a seat in parliament, and in spite of Danby’s endeavour to seize his papers by an order in council, on the 20th of December 1678 caused two of the incriminating letters written by Danby to him to be read aloud to the House of Commons by the Speaker. The House immediately resolved on Danby’s impeachment. And the following is the literal text of the order of the day: “I receive this letter. C.R., in his own handwriting; but they were not read by the Speaker, and were entirely neglected in the proceedings against the minister, thus emphasizing the constitutional principle that obedience to the orders of the sovereign can be no bar to an impeachment. He was charged with having encroached to himself royal powers by treating matters of peace and war without the knowledge of the council, with having promoted the raising of a standing army on pretence of a war with France, with having obstructed the assembling of parlia-

ment, with corruption and embezzlement in the treasury. Danby, while communicating the “Popish Plot” to the parliament, had from the first expressed his disbelief in the so-called revelations of Titus Oates, and his backwardness in the matter now furnished an additional charge of having “traitorously concealed the plot.” He was voted guilty by the Commons; but while the Lords were disputing whether the accused peer should have bail, and whether the charges amounted to more than a misdemeanour, parliament was prorogued on the 30th of December and dissolved three weeks later. In March 1679 a new parliament hostile to Danby was returned, and he was forced to resign the treasurership; but he received a pardon from the king under the Great Seal, and a warrant for a marquesse.” His proposed advancement in rank was severely reflected upon in the Lords, Halifax declaring it in the king’s presence the recompense of treason, “not to be borne”; and in the Commons his retirement from office by no means appeased his antagonists. The proceedings against him were revived, a committee of privileges deciding on the 19th of March 1679 that the dissolution of parliament was no abatement of an impeachment. A motion was passed for his committal by the Lords, who, as in Clarendon’s case, voted his banishment. This was, however, rejected by the Commons, who now passed an act of attainder. Danby had removed to the country, but returned on the 21st of April to avoid the threatened passing by the Lords of the attainder, and was sent to the Tower. In his written defence he now pleaded the king’s pardon, but on the 5th of May 1679 it was pronounced illegal by the Commons. This declaration was again repeated by the Commons in 1689 on the occasion of another attack made upon Danby in that year, and was finally embodied in the Act of Settlement in 1701.

The Commons now demanded judgment against the prisoner from the Lords. Further proceedings, however, were stopped by the dissolution of parliament again in July; but for nearly five years Danby remained a prisoner in the Tower. A number of pamphlets asserting the complicity of the fallen minister in the Popish Plot, and even accusing him of the murder of Sir Edmund Berry Godfrey, were published in 1679 and 1680; they were answered by Danby’s secretary, Edward Christian, in Reflections; and in May 1681 Danby was actually indicted by the Grand Jury of Middlesex for Godfrey’s murder on the accusation of Edward FitzHarris. His petition to the king for a trial by his peers on this indictment was refused, and an attempt to prosecute the publishers of the false evidence in the king’s bench was unsuccessful. For some time all appeals to the king, to parliament, and to the courts of justice were unavailing; but on the 12th of February 1684 his application to Chief Justice Jeffreys was at last successful, and he was set at liberty on finding bail to the amount of £40,000 to appear in the House of Lords in the following session. He visited the king at court the same day; but took no part in public affairs for the rest of the reign.

After James’s accession Danby was discharged from his bail by the Lords on the 19th of March 1685, and the order declaring a pardon to be no abatement of an impeachment was reversed. He again took his seat in the Lords as a leader of the moderate Tory party. Though a strong Tory and supporter of the hereditary principle, James’s attacks on Protestantism soon drove him into opposition. He was visited by Dvykvet, William of Orange’s agent; and in June 1687 he wrote to William assuring him of his support. On the 30th of June 1688 he was one of the seven leaders of the Revolution who signed the invitation to William. In November he occupied York in the prince’s interest, returning to London to meet William on the 26th of December. He appears to have thought that William would not claim the crown, and at first supported the throne that the church having been vacated by James’s flight the succession fell as of right to Mary; but as this met with little support, and was rejected both by William and by Mary herself, he voted against the regency and joined with...
Halifax and the Commons in declaring the prince and princess joint sovereigns. Danby had rendered extremely important services to William's cause. On the 20th of April 1689 he was created marquess of Carmarthen and was made lord-lieutenant of the three ridings of Yorkshire. He was, however, still greatly disliked by the Whigs, and William, instead of reinstating him in the lord treasurership, only appointed him president of the council in February 1689. He did not conceal his vexation and disappointment, which were increased by the appointment of Halifax to the office of lord privy seal. The antagonism between the “black” and the “white marquess” (the latter being the nickname given to Carmarthen in allusion to his sickly appearance), which had been forgotten in their common hatred to the French policy and to Rome, revived in all its bitterness. He retired to the country, which was seldom present at the council. In June and July new motions were made in parliament for his removal; but notwithstanding his great unpopularity, on the retirement of Halifax in 1690 he again acquired the chief power in the state, which he retained till 1695 by bribery in parliament and by the support of the king and queen. In 1690, during William's absence in Ireland, he was appointed Mary's chief adviser. In 1691, desiring to compromise Halifax, he discarded himself by the patronage of an informer named Fuller, soon proved an impostor. He was absent in 1692 when the Place Bill was thrown out. In 1693 he presided in great state as lord high steward at the trial of Lord Mohun; and on the 4th of May 1694 he was created duke of Leeds. The same year he supported the Triennial Bill, but opposed the new treason bill as weakening the hands of the executive. Meanwhile fresh attacks had been made upon him. He was accused unjustly of Jacobitism. In April 1695 he was impeached once more by the Commons for having received a bribe of 5000 guineas to procure the new charter for the East India Company. In his defence, while denying that he had received the money and appealing to his past services, he did not attempt to conceal the fact that according to his experience bribery was an acknowledged and universal custom in public business, and that he himself had been instrumental in obtaining money for others. Meanwhile his servant, who was said to have been the intermediary between the duke and the Company in the transaction, fled the country; and no evidence being obtainable to convict, the proceedings fell to the ground. In May 1695 he had been ordered to discontinue his attendance at the council. He returned in October, but was not included among the lords justices appointed regents during William's absence in this year. In November he was created D.C.L. by the university of Oxford; in December he became a commissioner of trade, and in December 1696 governor of the Royal Fishery Company. He opposed the prosecution of Sir John Fenwick, but supported the action taken by members of both Houses in defence of William's rights in the same year. On the 23rd of April 1698 he entertained the tsar, Peter the Great, at Wimbledon. He had for some time lost the real direction of affairs, and in May 1699 he was compelled to retire from office and from the lord-lieutenancy of Yorkshire.

In Queen Anne's reign, in his old age, he is described as "a gentleman of admirable natural parts, great knowledge and experience in the affairs of his own country, but of no reputation with any party. He hath not been regarded, although he took his place at the council board."[1] The veteran statesman, however, by no means acquiesced in his enforced retirement, and continued to take an active part in politics. As a zealous churchman and Protestant he still possessed a following. In 1705 he supported a motion that the church was in danger, and in 1710 in Sacheverell's case spoke in defence of hereditary right.[2] In November of this year he obtained a renewal of his pension of £3500 a year from the post office which he was holding in 1694,[3] and in 1711 at the age of eighty was a competitor for the office of lord privy seal.[4] His long and eventful career, however, terminated soon afterwards by his death on the 26th of July 1712.

In 1710 the duke had published Copies and Extracts of some letters written to and from the Earl of Danby . . . in the years 1670, 1677 and 1678, in defence of his conduct, and this was accompanied by Memoirs relating to the Impeachment of Thomas, Earl of Danby. The original letters, however, of Danby to Montagu have also been published (by the Historical MSS. Commission from the MSS. of J. Eliot Hodgkin), and are seen to have been considerably garbled by Danby for the purposes of publication, several passages being obliterated and others altered by his own hand.

**Later Dukes of Leeds.**

The duke's only surviving son, Peregrine (1659-1729), who became 2nd duke of Leeds on his father's death, had been a member of the House of Lords as Baron Osborne since 1660, but he is better known as a naval officer; in this service he attained the rank of a vice-admiral. He died on the 25th of June 1720, when his son Peregrine Hyde (1691-1731) became 3rd duke. The 4th duke was the latter's son Thomas (1713-1780), who was succeeded by his son Francis.

Francis Osborne, 5th duke of Leeds (1751-1769), was born on the 20th of January 1727, and was educated at Westminster school and at Christ Church, Oxford. He was a member of parliament in 1774 and 1775; in 1776 he became a peer as Baron Osborne, and in 1777 lord chamberlain of the queen's household. In the House of Lords he was prominent as a determined foe of the prime minister, Lord North, who, after he had resigned his position as chamberlain, deprived him of the office of lord-lieutenant of the East Riding of Yorkshire in 1780. He regained this, however, two years later. Early in 1783 the marquess of Carmarthen, as he was called, was selected as ambassador to France, but he did not take up this appointment, becoming instead secretary for foreign affairs under William Pitt in December of the same year. As secretary he was little more than a cipher, and he left office in April 1791. Subsequently he took some slight part in politics, and he died in London on the 31st of January 1799.

The Poetical and Historical Pieces of Miss D. Neve, were edited by Oscar Browning for the Camden Society in 1884, and there are eight volumes of his official correspondence in the British Museum. His first wife was Amelia (1743-1784), daughter of Robert Darcy, 4th earl of Holderness, who became Baroness Conyers in her own right in 1778. Their elder son, George William Frederick (1775-1838), succeeded his father as duke of Leeds and his mother as Baron Conyers. These titles were, however, separated when his son, Francis Godolphin Darcy, the 7th Duke (1798-1859), died without sons in May 1859. The barony passed to his nephew, Sackville George Lane-Fox (1827-1888), falling into abeyance on his death in August 1888, and the dukedom passed to his cousin, George Godolphin Osborne (1802-1872), a son of Francis Godolphin Osborne (1777-1839), who was created Baron Godolphin in 1832. In 1859 George's grandson George Godolphin Osborne (b. 1862) became 10th duke of Leeds. The name of Godolphin, which is borne by many of the Osburnes, was introduced into the family through the marriage of the 4th duke with Mary (d. 1764), daughter and co-heiress of Francis Godolphin, and grand-daughter of the great duke of Marlborough. 

**LEEDS.** a city and municipal county and parliamentary borough in the West Riding of Yorkshire, England, 185 m. ...
LEEDS

369

N.W. from London. Pop. (1891) 567,505; (1901) 428,958. It is served by the Great Northern railway (Central station), the Midland (Wellington station), North-Eastern and London & North-Western (New station), and Great Central and Lancashire & Yorkshire railways (Central station). It lies nearly in the centre of the Riding, in the valley of the river Aire.

The plan of the city is in no way regular, and the numerous handsome public buildings are distributed among several streets, principally on the north side of the narrow river. The town hall is a fine building in Grecian style, well placed in a square between Park Lane and Great George Street. It is of oblong shape, with a handsome façade over which a dometed clock-tower. The principal apartment is the Victoria Hall, a richly ornamented chamber measuring 161 ft. in length, 72 in breadth and 75 in height. It was opened in 1858 by Queen Victoria. Immediately adjacent to it are the municipal offices (1884) in Italian style. The Royal Exchange (1872) in Boar Lane is an excellent Perpendicular building. In ecclesiastical architecture Leeds is not rich. The church of St John, however, is an interesting example of the junction of Gothic traditions with Renaissance tendencies in architecture. It dates from 1634 and contains some fine contemporary woodwork. St Peter's parish church occupies an ancient site, and preserves a very early cross from the former building. The church was rebuilt in 1840 at the instance of the vicar, Dr Walter Farquhar Hook (1798-1872), afterwards dean of Chichester, whose work here in a poor and ill-educated parish brought him fame. The church of All Souls (1889) commemorates him. It may be noted that the vicarage of Leeds has in modern times commonly formed a step to the episcopal bench. There are numerous other modern churches and chapels, of which the Unitarian chapel in Park Row is noteworthy. Leeds is the seat of a Roman Catholic bishop, with a pro-cathedral dedicated to St Anne. There is a large free library in the municipal offices, and numerous branch libraries are maintained. The Leeds old library is a private institution founded in 1752 by a Priory, who was then the minister of the Unitarian chapel. It occupies a building in Commercial Street. The Philosophical and Literary Society, established in 1820, possesses a handsome building in Park Row, known as the Philosophical Hall, containing a laboratory, scientific library, lecture room, and museum, with excellent natural history, geological and archaeological collections. The City Art Gallery was completed in 1888, and contains a fine permanent collection, while exhibitions are also held. The University, incorporated in 1904, grew out of Yorkshire College, established in 1875 for the purpose of supplying instruction in the arts and sciences which are applicable to the manufactures, engineering, mining and agriculture of the county. In 1887 it became one of the constituent colleges of Victoria University, Manchester, and so remained until its separate incorporation. The existing building was completed in 1887, and contains a hall of residence, a central hall and library, and complete equipments in all departments of instruction. New buildings have been opened in extension of the original scheme, such as the medical department (1894).

A day training college is a branch of the institution. The Mechanics' Institute (1865) occupies a handsome Italian building in Cookridge Street near the town hall. It comprises a lecture hall, library, reading and class rooms; and day and evening classes and an art school are maintained. The grammar school, occupying a Gothic building (1858) at Woodhouse Moor, dates its foundation from 1552. It is largely endowed, and possesses exhibitions tenable at Oxford, Cambridge and Durham universities. There is a large training college for the Wesleyan Methodist ministry in the suburb of Headingley. The Yorkshire Ladies' Council of Education has as its object the promotion of female education, and the instruction of girls and women of the artisan class in domestic economy, &c.

The general infirmary in Great George Street is a Gothic building of brick with stone dressings, with a highly ornamental exterior by Sir Gilbert Scott, of whose work this is by no means the only good example in Leeds. The city possesses further notable buildings in its market-halls, theatres, clubs, &c.

Among open spaces devoted by the corporation to public use that of Woodhouse Moor is the principal one within the city, but 3 m. N.E. of the centre is Roundhay Park, a tract of 700 acres, beautifully laid out and containing a picturesque lake. In 1889 there came into the possession of the corporation the ground, lying 3 m. up the river from the centre of the city, containing the celebrated ruins of Kirkstall Abbey. The remains of this great foundation, of the middle of the 12th century, are extensive, and so far typical of the usual arrangement of Cistercian houses as to be described under the heading Abbey. The ruins are carefully preserved, and form a remarkable contrast with the surrounding industrial district. Apart from Kirkstall there are few antiquarian remains in the locality. In Guildford Street, near the town hall, is the Red Hall, where Charles I. lay during his enforced journey under the charge of the army in 1647.

For manufacturing and commercial purposes the situation of Leeds is highly advantageous. It occupies a central position in the railway system of England. It has communication with Liverpool by the Leeds and Liverpool Canal, and with Goole and the Humber by the Aire and Calder Navigation. It is moreover the centre of an important coal and iron district. Though regarded as the capital of the great manufacturing district of the West Riding, Leeds is not in its centre but on its border. Eastward and northward the country is agricultural, but westward and southward lies a mass of manufacturing towns. The characteristic industry is the woollen manufacture. The industry is carried on in a great number of neighbouring towns, but the cloth is commonly finished or dressed in the city itself, this procedure differing from that of the wool manufacturers in Gloucestershire and the west of England, who carry out the entire process in one factory. Formerly much of the business between manufacturer and merchant was transacted in the cloth halls, which formed a kind of market, but merchants now order goods directly from the manufacturers. Artificial silk is important among the textile products. Subsidiary to these leading industries is the production of machine-made clothing, hats and caps. The leather trade of Leeds is the largest in England, though no sole leather is tanned. The supply comes chiefly from British India. Boots and shoes are extensively manufactured. The iron trade in its different branches rivals the woollen trade in wealth, including the casting of metal, and the manufacture of steam engines, steam wagons, steam ploughs, machinery, tools, nails, &c. Leeds was formerly famed for the production of artistic pottery, and specimens of old Leeds ware are highly prized. The industry lapsed about the end of the 18th century, but has been revived in modern times. Minor and less specialized industries are numerous.

The parliamentary borough is divided into five divisions (North, Central, South, East and West), each returning one member. The county borough was created in 1888. Leeds was raised to the rank of a city in 1893. The municipal borough is under a lord mayor (the title was conferred in 1897 on the occasion of Queen Victoria's Diamond Jubilee). 16 aldermen and 48 councillors. Area, 21,572 acres.

Leeds (Loidis, Leodes) is mentioned by Bede as the district where the Northumbrian kings had a royal villa in 627, and where Oswy, king of Northumbria, defeated Penda, king of the Mercians, in 666. Before the Norman Conquest seven thanes held it of Edward the Confessor as seven manors, but William the Conqueror granted the whole to Ilbert de Lacy, and at the time of the Domesday Survey it was held by him of Ralph Paganel, who is said to have raised Leeds castle, possibly on the site of an earlier fortification. In 1205 the burgesses of Leeds, fearing that the burgesses ( beforehand freed from the burhoms) granting them the same liberties as Robert de Lacy had granted to Pontefract, including the right of selling burglar land to whom they pleased except to religious houses, and freedom from toll to themselves and others, in the office of the mayor, who was to be chosen by the lord of the manor, the burgesses being "more eligible if only they would pay as much as others for the office." The town was incorporated by Charles I. in 1626 under the title of the Maineon, 7 principal burgesses and 23 assistants. A second charter granted by Charles II. in 1661 appointed a mayor, 12 aldermen and 34 assistants, and is still the governing charter of the borough. The woollen manufacture is said to have been introduced into Leeds in the 14th century, and owing to the facilities for trade afforded by its position on the river Aire soon became an important
industry. Camden, writing about 1590, says, “Leeds is rendered
wealthy by its woollen manufactures,” and the incorporation
charter of 1626 recites that “the inhabitants have for a long time
exercised the art of making cloth.” The cloth was then, as it is now,
made in the neighbouring villages and only finished and sold in the
town. A successful attempt was made in the beginning of the
19th century by Mr. William Hirst to introduce goods of a
superior quality which were made and finished in his own factory.
Sometimes up to the present day, it is used only for the finishing
process. The worsted trade which was formerly carried on to some extent has now almost disappeared.

The spinning of flax by machinery was introduced early in the 19th century. Mr. John Mill's Patent Cloth Manufactory, one of the first to apply Sir Richard Arkwright's water frame, invented for cotton manufacture, to the spinning of linen yarn.
The bourgeois were represented in parliament by one member during the
Commonwealth, but not again until by the Reform Act of 1832 they
were allowed to return two members. In 1867 they were
granted an additional member.

See James Wardell, The Municipal History of the Borough of Leeds
(1846); J. D. Whittaker, Leeds and Elmete; or an Attempt to illustrate the Districts described in these words by Rev. J. A. Hill.

Atkinson, Ralph Thoresby, the Topographer; his Town (Leeds) and Times (1885-1887).

LEEK, a market town in the Leek parliamentary division
of Staffordshire, England, 137 m. N.W. from London, on the
Churnet Valley branch of the North Staffordshire railway.

Pop. of urban district (1901) 15,484. The town lies high in
a picturesque situation near the head of the river Churnet.
The river is crossed by a main bridge which goes north and stands in a churchyard commanding a beautiful view from
an elevation of some 640 ft. There is here a curious pillar of
Danish work ornately carved. An institute contains a free library,
lecture hall, art gallery and school of art. A grammar school
was established in 1723. In the vicinity are ruins of the Cistercian
abbey De la Croix, or Dieulacresse, erected in 1214
by Ralph de Blundevill, earl of Chester. The slight remains are
principally embodied in a farm-house. The silk manufacture
includes sewing silk, braids, silk buttons, &c. Cloud Hill, rising to
1190 ft. W. of the town, causes a curious phenomenon in the
height of summer, the sun sinking behind one flank to reappear
beyond the other, and thus appearing to set twice.

Leek (Lee, Leike, Lekee) formed part of the great estates of
Elfgar, earl of Mercia; it escheated to William the Conqueror
who held it at the time of the Domesday Survey. Later it
passed to the earls Palatine of Chester, remaining in their hands
until 1628, when Blundevill, earl of Chester, gave it to the abbey
of Dieulacresse, which continued to hold it until its dissolution.
The same earl in a charter which he gave to the town (temp.
John) calls it a borough and grants to his free burgesses various
privileges, including freedom from toll throughout Cheshire.
These privileges were confirmed by Richard, abbot of Dieulacresse,
but the town received no royal charter and failed to establish
its burghal position. The Wednesday market which is still
held dates from a grant of John to the earl of Chester; in the
17th century it was very considerable. A fair, also granted by
John, beginning on the third day before the Translation of
Edward the Confessor is still held. The silk manufacture which
can be traced to the latter part of the 17th century is thought to
have been aided by the settlement in Leek of some Huguenots
after the revocation of the Edict of Nantes. In the 17th and
18th centuries the town was famous for its ale. Prince Charles
Edward passed through Leek on his march to Derby (1745)
and again on his return journey to Scotland. A story in connexion
with the Civil War is told to explain the expression
“Now thus” occurring on the tombstone of a citizen, who by this
meaningless answer to all questions sought escape on the
plea of insanity.

LEEK, the Allium Porrum of botanists, a plant now
considered as a mere variety of Allium Ampeloprasum, wild leek,
produced by cultivation. The plant is probably of Eastern
origin, since it was commonly cultivated in Egypt in the time of
the Pharaohs, and is so to the present day; while as regards
its first appearance in England both Tusser and Gerard—two
of the earliest writers on this class of subjects, the former of
whom flourished in the early part and the latter in the latter part of
the 16th century—speak of it as being then commonly culti-
vated and used. The Romans, it would appear, made great
use of the leek for savouring their dishes, as seems proved by
the number of recipes for its use referred to by Celsus. Hence
it is more than probable that it was brought to England by the
Romans. Italy was celebrated for leeks in the time of Pliny
(H.N. xii. c. 6), according to whom they were brought into
great esteem through the emperor Nero, desirously surnamed
“Porrophagus,” who used to eat them for several days in every
month to clear his voice. The leek is very generally cultivated
in Great Britain as an esculent, but more especially in Scotland
and in Wales, being esteemed as an excellent and wholesome
vegetable, with properties very similar to those of the onion,
but of a milder character. In America it is not much cultivated
except by market gardeners in the neighbourhood of large cities.
The whole plant, with the exception of the fibrous roots, is
used in soups and stews. The sheathing stalks of the leaves lap
over each other, and form a thickish stem-like base, which is
blanched, and is the part chiefly preferred. These blanched
stems are much employed in French cookery. They form an
important ingredient in Scotch winter broth, and particularly
in the national dish cock-a-leekie, and are also largely used boiled,
and served with toasted bread and white sauce, as in the case of
asparagus.

Leeks are sown in the spring, earlier or later according to
the soil and the season, and are planted out for the
summer, being dropped into holes made with a stout dibble
and left unfilled in order to allow the stems space to swell.
When they are thus planted deeply the holes gradually fill up,
and the base of the stem becomes blanched and prepared for use,
by a process aided by drawing up the earth round about the stems
as they elongate. The leek is one of the most useful vegetables
the cottager can grow, as it will supply him with a large amount
of produce during the winter and spring. It is extremely hardy,
and presents no difficulty in its cultivation, the chief point,
as with all succulent esculents, being that it should be grown
quickly upon well-enriched soil. The plant is of biennial
duration, flowering the second year, and perishing after perfecting
its seeds.

The leek is the national symbol or badge of the Welsh
who wear it in their hats on St. David’s Day. The origin of this
custom has received various explanations, all of which are
more or less speculative.

LEER, a town and river port in the Prussian province
of Hanover, lying in a fertile plain on the right bank of the
Leda near its confluence with the Ems, and at the junction
of railways to Bremen, Emden and Münster. Pop. (1903) 12,547.
The streets are broad, well paved, and adorned with many
elegant buildings, among which are Roman Catholic, Lutheran
and Calvinist churches, and a new town hall with a tower 156 ft.
high. Among its educational establishments are a classical
school and a school of navigation. Linen and woollen fabrics,
hoisery, paper, cigars, soap, vinegar and earthenware are
manufactured, and there are iron-foundries, distilleries, tanneries
and shipbuilding yards. Many markets for horses and cattle are
held. The town is situated on the trade routes from the regions traversed by the Westphalian and Oldenburg railways.
The principal exports are cattle, horses, cheese, butter, honey, wax,
deer, flour, paper, hardware and Westphalian coal. Leer is one of
the principal ports for steamboat communication with the
North Sea and Leeward coasts of Borkum and Norderney. Leer
is a very old place, although it only obtained municipal privileges
in 1823. Near the town is the Plitenberg, formerly a heathen
place of sacrifice.

LEEUWARDEN, the capital of the province of Friesland,
Holland, on the canal between Harlingen and Groningen, 33 m.
by rail W. of Groningen. Pop. (1901) 32,203. It is one of the
most prosperous towns in the country. To the name of the
Frisian Hague, it is entitled as well by similarity of history as
by similarity of appearance. As the Hague grew up round
the court of the counts of Holland, so Lueuwarden round the

1 Tusser, in his verse for the month of March, writes—
“Now leeks are in season, for pottage ful good,
And spareth the milk cow, and purgeth the blood,
These haung with peason, for pottage in Lent,
Thou spareth both otemel and bread to be spent.”
court of the Frisian stadtholders; and, like the Hague, it is an exceptionally clean and attractive town, with parks, pleasure grounds, and drives. The old gates have been somewhat ruthlessly cleared away, and the site of the town walls on the north and west competes with the park called the Prince's Garden as a public pleasure ground. The Prince's Garden was originally laid out by William Frederick of Nassau in 1648, and was presented to the town by King William I. in 1829. The royal palace, which was the seat of the Frisian court from 1603 to 1747, is now the residence of the royal commissioner for Friesland.

It was restored in 1816 and contains a portrait gallery of the Frisian stadtholders. The fine mansion called the Kanselary was begun in 1582 as a residence for the chancellor of George of Saxony (1539), governor of Friesland, but was only completed in 1571 and served as a court house until 1811. It was restored at the end of the 19th century to contain the important provincial archives. Other noteworthy buildings are the picturesque weigh-house (1595), the town hall (1759), the provincial courts (1850), and the great church of St Jacob, once the church of the Jacobins, and the largest monastic church in the Netherlands. The splendid tombs of the Frisian stadtholders buried here (Louis of Nassau, Anne of Orange, and others) were destroyed in the revolution 1795. The unfinished tower of Oldehove dates from 1529-1532. The museum of the Frisian Society is of modern foundation and contains a collection of provincial antiquities, including two rooms from Hindeloopen, an ancient village of Friesland, some 16th- and 17th-century portraits, some Frisian works in silver of the 17th and 18th centuries, and a collection of porcelain and faience.

Leeuwarden is the centre of a flourishing trade, being easily accessible from all parts of the province by road, rail, and canal. The chief business is in stock of every kind, dairy and agricultural produce and fresh-water fish, a large quantity of which is exported to France. The industries include boat-building and timber yards, iron-foundries, copper and lead works, furniture, organ, tobacco and other factories, and the manufacture of gold and silver wares. The town is first mentioned in documents of the 13th century.

**LEEUVENHOEK, or LEEUVENHOEK, ANTHONY VAN (1632-1723), Dutch microscopist, was born at Delft on the 24th of October 1632. For a short time he was in a merchant's office in Amsterdam, but early devoted himself to the manufacture of microscopes and to the study of the minute structure of organized bodies by their aid. He appears soon to have found that single lenses of very short focus were preferable to the compound microscopes then in use; and it is clear from the discoveries with which he was rewarded that he had a very excellent quality. His discoveries were for the most part made public in the Philosophical Transactions of the Royal Society, to the notice of which body he was introduced by R. de Graaf in 1673, and of which he was elected a fellow in 1680. He was chosen a corresponding member of the Paris Academy of Sciences in 1697. He died at his native place on the 26th of August 1723. Though his researches were not conducted on any definite scientific plan, his powers of careful observation enabled him to make many interesting discoveries in the minute anatomy of man, the higher animals and insects. He confirmed and extended M. Malpighi's demonstration of the blood capillaries in 1668, and six years later he gave the first accurate description of the red blood corpuscles, which he found to be circular in man but oval in frogs and fishes. In 1677 he described and illustrated the spermatozoon in dogs and other animals, though in the discovery Stephen Hamm had anticipated him by a few months; and he investigated the structure of the teeth, crystalline lens, muscle, &c. In 1680 he noticed that yeast consists of minute globular particles, and he described the different structure of the stem in monocotyledonous and dicotyledonous plants. His researches in the life-history of various the lower forms of animal life were in opposition to the doctrine that they could be "produced spontaneously, or bred from corruption." Thus he showed that the weevil of grain was "bred from wheat, as well as in it, are grubs hatched from eggs deposited by winged insects. His chapter on the flea, in which he not only describes its structure, but traces out the whole history of its metamorphoses from its first emergence from the egg, is full of interest—not so much for the exactness of his observations, as for its incidental revelation of the extraordinary life-history and development prevalent among the insects. From 1672 to this minute and despised creature, which some asserted to be produced from sand, others from the dung of pigeons, and others from urine, but which he showed to be "innocent and harmless," and to be of "little advantage to any large animal," and proved to breed in the regular way of winged insects. He even noted the fact that the pupa of the flea is sometimes attacked and fed upon by a mite—an observation which suggested the well-known research of Dr. Swift (1667-1745), which has drawn attention having been drawn to the blighting of the young shoots of fruit-trees, which was commonly attributed to the ants found upon them, that he was the first to find the Aphides that really do the mischief; and, upon searching into the nature of this insect, he discovered that they were fed upon by the bodies of their parents. He carefully studied also the history of the ant and was the first to show that what had been commonly reputed to be "ants' eggs" are really pupae, containing the perfect insect nearly ready for emergence, whilst the true eggs are far smaller, and give origin to "maggots" or larvae. Of the sea-mussel, again, and other shell-fish, he argued (in reply to a then recent defence of Aristotle's doctrine by F. Buonanni, a learned Jesuit of Rome) that they are not generated out of the mud or sand found on the seashore or the beds of rivers at low water, but from spawn, by the regular course of generation; and he maintained the same to be true of the fresh-water mussel (Unio), whose ova he examined so carefully that he saw by the aid of his most powerful microscope the phenomenon supposed to have been first discovered long afterwards. In the same spirit he investigated the generation of eels, which were at that time supposed, not only by the ignorant vulgar, but by "reputed philosophers," to be the result of "natural generation," and that the ordinary process of generation. Not only was he the first discoverer of the rotifers, but he showed "how wonderfully nature has provided for the preservation of their species," by their tolerance of a great part of the water drained off from their dens, and led to the discovery of the evaporating fluids of their bodies by the impermeability of the casing in which they then become enclosed. "We can now easily conceive," he says, "that in all rain-water which is collected in cisterns, or in pots, bottles, or vials, and in air, in which animalculae may be found; for they may be carried thither by the particles of dust blown about by the winds."

Leeuwenhoek's contributions to the Philosophical Transactions amounted to one hundred and sixty-six papers in the Memoirs of the Paris Academy of Sciences. Two collections of his works appeared during his life, one in Dutch (Leiden and Delft, 1685-1718), and the other in Latin (Opera omnia s. Arcana naturae et exactissimorum microscopiorum selecta, Leiden, 1715-1722) and a selection from them was translated by S. Hoole and published in English (London, 1798-1781). 

**LEEWARD ISLANDS, a group in the West Indies. They derive their name from being less exposed to the prevailing N.E. trade wind than the adjacent Windward Islands. They are the most northerly of the Lesser Antilles, and form a curved chain stretching S.W. from Puerto Rico to meet St Lucia, the most northerly of the Windward Islands. They consist of the Virgin Islands (called St Kitts, Antigua, Montserrat, Guadeloupe, Dominica, Martinique and their various dependencies). The Virgin Islands are owned by Great Britain and Denmark, Holland having St Eustatius, with Saba, and part of St Martin. France possesses Guadeloupe, Martinique, St Bartholomew and the remainder of St Martin. The rest of the islands are British, and (with the exception of Sombrero, a small island used only as a lighthouse-station) form, under one governor, a colony divided into five parishes, namely: Antigua (with Barbuda and Redonda), St Kitts (with Nevis and Anguilla), Dominica, Montserrat and the Virgin Islands. Total pop. (1901) 127,536.

There is one federal executive council nominated by the crown, and one federal legislative council—ten nominated and ten elected members. Of the latter, four are chosen by the unofficcial members of the local legislative council of Antigua, two by the bishops, and the other four by the officers of the local legislative council of St Kitts-Nevis. The local legislative council meets once annually, usually at St John, Antigua.

**LE FANU, JOSEPH SHERIDAN** (1814-1873), Irish journalist and author, was born of an old Huguenot family at Dublin on the 28th of August 1814. He entered Trinity College, Dublin, in 1833. At an early age he had given proof of literary talent, and in 1837 he joined the staff of the Dublin University Magazine, of which he became later editor and proprietor. In 1837 he produced the Irish ballad Phaedrig Crookore, which was
shortly afterwards followed by a second, Shamus O'Brien, successfully recited in the United States by Samuel Lover. In 1839 he became proprietor of the Warder, a Dublin newspaper, and, after purchasing the Evening Packet and a large interest in the Dublin Evening Mail, he combined the three papers under the title the Evening Mail, a weekly reprint from which was issued as the Warder. After the death of his wife in 1848 he lived in retirement, and his best work was produced at this period of his life. He wrote some clever novels, of a sensational order, in which his vigorous imagination and his Irish love of the supernatural have full play. He died in Dublin on the 7th of February 1873. His best-known novels are The House by the Churchoyard (1863) and Uncle Silas, a Tale of Bartrom Haugh (1864). The Purcell Papers, Irish stories dating from his college days, were edited with a memoir of the author by A. P. Graves in 1880.

LEFEBVRE, PIERRE FRANCOIS JOSEPH, duke of Danzig (1755-1820), marshal of France, was born at Rouffach in Alsace on the 20th of October 1755. At the outbreak of the Revolution he was a sergeant in the Gardes françaises, and with many of his comrades of this regiment took the popular side. He distinguished himself in the breach by humanity in many of the street fights in Paris, and becoming an officer again distinguishing himself—this time against foreign invaders—he was general of division in 1794. He took part in the Revolutionary Wars from Fleurs to Stokach, always resolute, strictly obedient and calm. At Stokach (1799) he received a severe wound and had to return to France, where he assisted Napoleon during the coup d'état of 18 Brumaire. He was one of the first generals of division to be made marshal at the beginning of the First Empire. He commanded the guard infantry at Jena, conducted the siege of Danzig 1806-1807 (from which town he received his title in 1808), commanded a corps in the emperor's campaign of 1808-1809 in Spain, and in 1809 was given the difficult task of commanding the Bavarian contingent, which he held in the containing engagements of Abensberg and Rohr and at the battle of Eckmühl. He commanded the Imperial Guard in Russia, 1812, fought through the last campaign of the empire, and won fresh glory at Montmirail, Areis-sur-Aube and Champaubert. He was made a peer of France by Louis XVIII. but joined Napoleon during the Hundred Days, and was appointed (formerly the upper chamber in 1814. He died at Paris on the 14th of September 1817. Marshal Lefebvre was a simple soldier, whose qualifications were his rank, great as they were, came from experience and not from native genius. He was incapable of exercising a supreme command, even of leading an important detachment, but he was absolutely trustworthy as a subordinate, as brave as he was experienced, and intensely loyal to his chief. He maintained to the end of his life a rustic simplicity of speech and demeanour. Of his wife (formerly a blanchequine to the Gardes françaises) many stories have been told, but in so far as they are to her discredit they seem to be false, she being, like the marshal, a plain "child of the people."

LEFEBVRE, TANNEGUY (TANAQUILLUS FABER) (1615-1672), French classical scholar, was born at Caen. After completing his studies in Paris, he was appointed by Cardinal Richelieu inspector of the printing-press at the Louvre. After Richelieu's death he left Paris, joined the Reformed Church, and in 1651 obtained a professorship at the academy of Saumur, which he filled with great success for nearly twenty years. His increasing ill-health and a certain moral laxity (as shown in his judgment on Sappho) led to a quarrel with the conservators, as a result of which he resigned his professorship. Several universities were eager to obtain his services, and he had accepted a post offered him by the elector palatine at Heidelberg, when he died suddenly on the 12th of September, 1672. One of his children was the famous Madame Dacier. Lefebvre, who was by no means a typical student in dress or manners, was a highly cultivated man and a thorough classical scholar. He brought out editions of various Greek and Latin authors—Longinus, Anacreon and Sappho, Virgil, Horace, Lucretius and many others. His most important original works are: Les Vies des poètes Grecs (1665); Méthode pour commencer les humanités Grecques et Latines (2nd ed., 1731), of which several English adaptations have appeared; Epistola Critica (1659).

In addition to the Mémoire pour . . . la vie de Tanneguy Lefebvre by F. Graverol (1686), see the article in the Nouvelle biographie générale, based partly on the MS. registers of the Saumur Académie.

LEFEBVRE-DESNOËTTES, CHARLES, comte (1773-1822), French cavalry general, joined the army in 1792 and served with the armies of the North, of the Sambre-and-Meuse and Rhine-and-Moselle in the various campaigns of the Revolution. Six years later he had become captain and aide-de-camp to General Bonaparte. At Marengo he won further promotion, and at Austerlitz became colonel, serving also in the Prussian campaigns of 1806-1807. In 1808 he was made general of brigade and created a count of the Empire. Sent with the army into Spain, he conducted the first and unsuccessful siege of Saragossa. The battlefield of Tudela showed his talents to better advantage, but towards the end of 1808 he was taken prisoner in the action of Beuvry near the French cavalry under Pegat (later Lord Uxbridge, and subsequently Viscount Anglesey). For over two years he remained a prisoner in England, and was allowed parole at Cheltenham. In 1811 he escaped, and in the invasion of Russia in 1812 was again at the head of his cavalry. In 1813 and 1814 his men distinguished themselves in most of the great battles, especially La Rothière and Montmirail. He joined Napoleon in the Hundred Days and was wounded at Waterloo. For his part in these events he was condemned to death, but he escaped to the United States, and spent the next few years farming in Louisiana. His frequent appeals to Louis XVIII. eventually obtained his permission to return, but the "Albion," the vessel on which he was returning to France, went down off the coast of Ireland with all on board on the 22nd of May 1822.

LE FÉVRÉ, JEAN (c. 1395-1468), Burgundian chronicler and seigneur of Saint Remy, is also known as Toison d'Or from his long connexion with the order of the Golden Fleece. Of noble birth, he adopted the profession of arms and with other Burgundians fought in the English ranks at Agincourt. In 1430, on the foundation of the order of the Golden Fleece by Philip III. of Burgundy, Le Fèvre was appointed its king of arms and he soon became a very influential person at the Burgundian court. He frequently assisted in conducting negotiations with foreign powers, and he was an expert in tournaments and on all questions of chivalry, where his wide knowledge of heraldry was highly useful. He died at Bruges on the 16th of June 1468.

Le Fèvre wrote a Chronique, or Histoire de Charles VI., roi de France. The greater part of this chronicle is merely a copy of the work of Enguerrand de Monstrelet, but Le Fèvre is an original authority for the years between 1428 and 1436 and makes some valuable additions to our knowledge, especially about the chivalry of the Burgundian court. He is more concise than Monstrelet, but is equally partial to the dukes of Burgundy. The Chronique has been edited by F. Morand for the Société de l'histoire de France (Paris, 1876). Le Fèvre is usually regarded as the author of the Livre des faiés de Jacques de Laoting.

LEG (a word of Scandinavian origin, from the Old Norwegian legg, cr. Swed. lägg, Dan. læg, the O. Eng. word was scenea, shank), the general name for those limbs in animals which support and move the body, and in man for the lower limbs of the body (see Anatomy, Superficial and Artistic, Skeleton, Appendicular; Muscular System). The word is in common use for many objects which resemble the leg in shape or function. As a slang term, "leg," a shortened form of "blackleg," has been in use since the end of the 18th century for a swindler, especially in connexion with racing or gambling. The term "blackleg" is now applied by trade-unionists to a workman who, during a strike or lockout, continues working or is brought to take the place of the withdrawn workers.

LEGACY (Lat. legatum), in English law, some particular thing or things given or left by a testator in his will, to be paid or performed by his executor or administrator. The word is primarily applicable to gifts of personality or gifts charged
upon real estate; but if there is nothing else to which it can refer it may refer to realty; the proper word, however, for gifts of realty is demise.

Legacies may be either specific, general or demonstrative. A **specific legacy** is "something which a testator, identifying it by a sufficient description and manifesting an intention that it should be enjoyed in the state and condition indicated by that description, separates in favour of a particular legatee from the general mass of his personal estate," e.g. a gift of "my portrait by X," naming the artist. A **general legacy** is a gift not so distinguished from the general mass of the personal estate, e.g. a gift of £100 or of a gold ring. A **demonstrative legacy** partakes of the nature of both the preceding kinds of legacies, e.g. a gift of £100 payable out of a named fund is a specific legacy so far as the fund named is available to pay the legacy; after the fund is exhausted the balance of the legacy is a general legacy and recourse must be had to the general estate to satisfy such balance. Sometimes a testator bequeaths two or more legacies to the same person; in such a case it is a question whether the latter legacies are in substitution for, or in addition to, the earlier ones. In the latter case they are known as **cumulative.** In each case the intention of the testator is the rule of construction; this can often be gathered from the terms of the will, but in the absence of such evidence the following rules are followed by the courts. Where the same specific thing is bequeathed twice to the same legatee or where two legacies of equal amount are bequeathed by the same instrument the second bequest is mere repetition; but where legacies of equal amounts are bequeathed by different instruments or of unequal amounts by the same instruments they are considered to be cumulative.

If the estate of the testator is insufficient to satisfy all the legacies these must abate, i.e. be reduced rateably; as to this it should be noticed that specific and demonstrative legacies have a prior claim to be paid in full out of the specific fund before general legacies, and that general legacies abate rateably *inter se* in the absence of any provision to the contrary by the testator. Specific legacies are liable to ademption where the specific thing perishes or ceases to belong to the testator, e.g. in the instance given above if the testator sells the portrait the legatee will get nothing by virtue of the legacy. As a general rule, legacies given to persons who predecease the testator do not take effect; they are void ab initio. This is the rule where the testator and his executors, administrators and assigns, but this is not so if the testator has shown a contrary intention, thus, a gift to A or his personal representative will be effective even though A predecease the testator; further, by the Wills Act 1837, devises of estates tail and gifts to a child or other issue of the testator will not lapse if any issue of the legatee survive the testator. Lapsed legacies fall into and form part of the residuary estate. In the absence of any indication to the contrary a legacy becomes due on the day of the death of the testator, though for the convenience of the executor it is not payable till a year after that date; this delay does not prevent the legacy vesting on the testator's death. It frequently happens, however, that a legacy is given payable at a future date; in such a case, if the legatee dies after the testator but prior to the date when the legacy is payable it is necessary to discover whether the legacy was vested or contingent, as in the former case it becomes payable to the legatee's representative; in the latter, it lapses. In this, as in other cases, the test is the intention of the testator as expressed in the will. Generally it may be said that a gift "to payable or " to be paid " at a certain fixed time confers a vested interest on the legatee, while a gift to A " at " a fixed time, e.g. twenty-one years of age, only confers on A an interest contingent on his attaining the age of twenty-one.

**Legacy Duty** is a duty charged by the state upon personal property devolving upon the legatees or next of kin of a dead person, either by virtue of his will or upon his intestacy. The duty was first imposed in England in 1780, but the principal act dealing with the subject is the **Legacy Duty Act 1796.** The principal points as to the duty are these. The duty is charged on personally only. It is payable only where the person on whose death the property passed was domiciled in the United Kingdom. The rate of duty varies from 10 to 10% according to the relationship between the testator and legatee. As between husband and wife no duty is payable. The duty is payable by the executors and deducted from the legacy unless the testator directs otherwise. Special provisions as to valuation are in force where the gift is of an annuity or is settled on various persons in succession, or the legacy is given in joint tenancy and other cases. In some cases the duty is payable by instalments which carry interest at 3%.

In various cases legacies are exempt from duty—the more important are gifts to a member of the royal family, specific legacies under £20 (pecuniary legacies under £20 pay duty), legacies of books, prints, &c., given to a body corporate for preservation, not for sale, and legacies given out of an estate the present value of which is under £1000, no legacy duty is payable. The legacy duty payable in Ireland is now for all practical purposes assimilated to that in Great Britain. The principal statute in that connection is the **Legacy Duty Act 1864.**

**LE GALLIENNE, RICHARD** (1866—), English poet and critic, was born in Liverpool on the 20th of January 1866. He started life in a business office in Liverpool, but abandoned this to turn author. *My Lady's Sonnets* appeared at Liverpool in 1887, and in 1889 he became for a short time literary secretary to Wilson Barrett. In the same year he published *Volumes in Folio, The Book Bills of Narcissus and George Meredith: some Characteristics* (new ed., 1900). He joined the staff of the *Star* in 1891, and wrote for various papers over the signature of "Logroller." *English Poems* (1892), *R. L. Stevenson and other Poems* (1893), a paraphrase of the *Rubáiyát* of Omar Khayyám, and *Odes from the Divan of Hafiz* (1903), contained some light, graceful verse, but he is best known by the fantastic prose essays and sketches of *Prose Fancies* (2 series, 1894–1895), *Sleeping Beauty and other Prose Fancies* (1900), *The Religion of a Literary Man* (1893), *The Quest of the Golden Girl* (1897), *The Life Romantic* (1901), &c. His wife, Mildred Lee, died in 1894, and in 1897 he married Julie Norregard, subsequently taking up his residence at the town of Selby near Flensburg. He died in 1906 he translated from the Danish, Peter Nansen's *Love's Triumph.*

**LEGARÉ, HUGH SWINTON** (1797–1843), American lawyer and statesman, was born in Charleston, South Carolina, on the 2nd of January 1797, of Huguenot and Scotch stock. Partly on account of his inability to share in the amusements of his fellows by reason of a deformity due to vaccine poisoning before he was five (the poison permanently arresting the growth and development of his legs), he was an eager student, and in 1814 he graduated at the College of South Carolina with the highest rank in his class and with a reputation throughout the state for scholarship and eloquence. He studied law for three years in South Carolina, and then spent two years abroad, studying French and Italian in Paris and jurisprudence at Edinburgh. In 1820–1822 and in 1824–1830 he was a member of the South Carolina legislature. In 1827, with Stephen Elliott (1771–1830), the naturalist, he founded the *Southern Review,* of which he was the sole editor after Elliott's death until 1834, when it was discontinued, and to which he contributed articles on law, travel, and modern and classical literature. In 1832–1833 he was attorney-general of South Carolina, and, although a State's Rights man, he strongly opposed nullification. During his term of office he appeared in a case before the United States Supreme Court, where his knowledge of civil law so strongly impressed Edward Livingston, the secretary of state, who was himself an admirer of Roman Law, that he urged Legaré to devote himself to the study of this subject with the hope that he might influence American law toward the spirit and philosophy and even the forms and processes of Roman jurisprudence.
Through Livingston, Legare was appointed American chargé d'affaires at Brussels, where from 1833 to 1836 he perfected himself in civil law and in the German commentaries on civil law. In 1837–1839, as a Union Democrat, he was a member of the national House of Representatives, and there ably opposed Van Buren's financial policy in spite of the enthusiasm in South Carolina for the sub-treasury project. He supported Harrison in the presidential campaign of 1840, and when the cabinet was reconstructed by Tyler in 1841, Legare was appointed attorney-general of the United States. On the 4th of May 1843 he was appointed secretary of state ad interim, after the resignation of Daniel Webster. On the 20th of June 1843 he died suddenly at Boston. His great work, the forcing into common law of the principles of civil law, was unaccomplished; but Story says "he seemed about to accomplish [it]; for his arguments before the Supreme Court were crowded with the principles of the Roman Law, wrought into the texture of the Common Law with great success." As attorney-general he argued the famous cases, the United States v. Miranda, Wood v. the United States, and Jewell v. Jewell.

See The Writings of Hugh Sciento Legare (2 vols., Charleston, S.C., 1840), edited by his sister, Mrs Mary Bulfin, who contributed a biographical sketch; and two articles by B. J. Ramage in The Southern Review (New York, 1873).

LEGAS, one of the Shangalla group of tribes, regarded as among the purest types of the Galla race. They occupy the upper Yabus valley, S.W. Abyssinia, near the Sudan frontier. The Legas are physically distinct from the Negro Shangalla. They are of very light complexion, tall and thin, with narrow hollow-cheeked faces, small heads and high foreheads. The chief families are of more mixed blood, with perceptible Negro strain. The Legas are estimated to number upwards of a hundred thousand, of whom some 20,000 are warriors. They are, however, a peaceful race, kind to their women and slaves, and energetic agriculturists. Formerly independent, they came about 1900 under the sway of Abyssinia. The Legas are pagans, but Mahommedanism has gained many converts among them.

LEGATE, BARTHOLOMEW (c. 1575–1612), English fanatical, was born in Essex and became a monk in cloth. About the beginning of the 17th century he became a preacher among a sect called the "Seekers," and appears to have held unorthodox opinions about the divinity of Jesus Christ. Together with his brother Thomas he was put in prison for heresy in 1601. Thomas died in Newgate gaol, London, but Bartholomew's imprisonment was not a rigorous one. James I. argued with him, and on several occasions he was brought before the Consistory Court of London, but without any definite result. Eventually, after having threatened to bring an action for wrongful imprisonment, Legate was tried before a full Consistory Court in February 1612, was found guilty of heresy, and was delivered to the secular authorities for punishment. Refusing to retract his opinions he was burned to death at Smithfield on the 18th of March 1612. Legate was the last person burned in London for his religious opinions, and Edward Wightman, who was burned at Lichfield in April 1612, was the last to suffer in this way in England.

LEGATE (Lat. legatus, past part. of legare, to send as deputy), a title now generally confined to the highest class of diplomatic representatives of the pope, though still occasionally used, in its original Latin sense, of any ambassador or diplomatic agent. According to the Nova Compilatio Decretalium of Gregory IX., under the title "De officio legati" the canon law recognizes two sorts of legate, the legatus natus and the legatus datus or missus. The legatus datus (missus) may be either (1) legatus, or (2) nuncius apostolicus, or (3) legatus a latere (lateralis, collateralis). The rights of the legatus natus, which included concurrent jurisdiction with that of all the bishops within his province, have been much curtailed since the 16th century; they were altogether suspended in presence of the higher claims of a legatus a latere, and the title is now almost quite honorary. It was attached to the see of Canterbury till the Reformation and it still attaches to the sees of Seville, Toledo, Arles, Reims, Lyons, Gran, Prague, Gnesen-Posen, Cologne, Salzburg, among others. The commission of the legatus delegatus (generally a member of the local clergy) is of a limited nature, and relates only to some definite piece of work. The nuncius apostolicus (who has the privilege of red apparel, a white horse and golden spurs) possesses ordinary jurisdiction within the province to which he has been sent, but his powers otherwise are restricted by the terms of his mandate. The legatus a latere (almost invariably a cardinal, though the power can be conferred on other prelates) is in the fullest sense the plenipotentiary representative of the pope, and possesses the high prerogative implied in the words of Gregory VII., "nostra vice quae corrigenda sunt corrigat, quae statuend constitut." He has the power of suspending all the bishops in his province, and no judicial cases are reserved from his judgment. Without special mandate, however, he cannot depose bishops or unite or separate bishoprics. At present legati a latere are not sent by the holy see, but diplomatic relations, where they exist, are maintained by means of nuncios, inter-nuncios and other agents.

The history of the office of papal legate is closely involved with that of the papacy itself. If it were proved that papal legates exercised the prerogatives of the primacy in the early councils, it would be one of the strongest points for the Roman Catholic view of the papal history. Thus it is claimed that Hosius of Cordova presided over the council of Nicaea (325) in the name of the pope. But the claim rests on slender evidence, since the first source in which Hosius is referred to as representative of the pope is Gelasius of Cyzicus in the Propontis, who wrote toward the end of the 5th century. It is even open to dispute whether Hosius was president at Nicaea, and though he certainly presided over the council of Sardica in 343, it was probably as representative of the emperors Constans and Constantius, who had summoned the council. Pope Julius I. was represented at Sardica by two presbyters. Yet the fifth canon, which provides for appeal by a bishop to Rome, sanctions the use of embassies a latere. If the appellant wishes the pope to send priests from his own household, the pope shall be free to do so, and to furnish them with full authority from himself ("ut de latere suo presbyteris mittat...habentes ejus auctoritatem a quo destinat sunt"). The decrees of Sardica, an obscure council, were later confused with those of Nicaea and thus gained weight.

In the synod of Ephesus in 431, Pope Celestine I. instructed his representatives to conduct themselves not as disputants but as judges, and Cyril of Alexandria presided not in his own name but in that of the pope (and of the bishop of Jerusalem). Instances of delegation of the papal authority in various degrees become numerous in the 5th century, especially during the pontificate of Leo I. Thus Leo writes in 444 (Ep. 6) to Anastasius of Thessalonica, appointing him his vicar for the province of Illyria; the same arrangement, he informs us, had been made by Pope Sisculus in favour of Anysius, the predecessor of Anastasius. Similar vicarial or legatine powers had been conferred in 418 by Zosimus upon Patroclus, bishop of Aries. In 440 Leo wrote at the "Rhefter Synod," from which his legates hardly escaped with life; at Chalcedon, in 451, they were treated with singular honour, though the imperial commissioners presided. Again, in 453 the same pope writes to the emperor Pulcheria, naming Julianus of Cos as his representative in the defence of the interests of orthodoxy and ecclesiastical discipline at Constantinople (Ep. 112); the instructions to Julianus are given in Ep. 113 ("hanc specialist curam vice mea functus assumas"). The designation of Anastasius as vicar apostolic over Illyria may be said to mark the beginning of the custom of conferring, ex officio, the title of legatus upon the holders of important sees, who ultimately came to be known as legati nati, with the rank of primate; the appointment of Julianus at Constantinople gradually developed into the long permanent office of apocrisiarius or responsarius. Another sort of delegation is exemplified in Leo's letter to the African bishops (Ep. 12), in which he sends Potentiatus, with instructions to inquire in his name, and to report ("vicem curae nostrae fratri et consacrori nostro Potenti delegantes qui de episcopis, querul culpabili..."")
ferebatur electio, quid veritas habet inquireret, nobisque omnia fideleri indicaret"). Passing on to the time of Gregory the Great we find his words to Simplicius, men to Gaul in 590, to suppress simony, and one to Spain in 603. Augustine of Canterbury is sometimes spoken of as legate, but it does not appear that in his case this title was used in any strictly technical sense, although the archbishop of Canterbury afterwards attained the permanent dignity of a legatus a latere. The policy of Gregory VII. naturally led to a great development of the legate as distinguished from the ordinary episcopal function. From the creation of the medieval papal monarchy until the close of the middle ages, the papal legate played a most important rôle in national as well as church history. The further definition of his powers proceeded throughout the 12th and 13th centuries. From the 16th century legates a latere gave way almost entirely to nuncios (q.v.).

LEGATION (Lat. legatio, a sending or mission), a diplomatic mission of the second rank. The term is also applied to the building in which the minister resides and to the area round it covered by his diplomatic immunities. See DIPLOMACY.

LEGEND (through the French from the med. Lat. legenda, things to be read, from legere, to read), in its primary meaning the history or life-story of a saint, and so applied to portions of Scripture and selections from the lives of the saints as read at divine service. The statutes of 3 and 4 Edward VI. dealing with the abolition of certain books and images (1549), cap. 10, sect. 1, says that "all books . . . called processionales, manuelles, legends . . . shall be . . . abolished." The "Golden Legend," or Aurea Legenda, was the name given to a book containing lives of the saints and descriptions of festivals, written by Jacobus de Voragine, archbishop of Genoa, in the 13th century. From the original application of the word to stories of the saints containing wonders and miracles, the word came to be applied to a story handed down without any foundation in history, but popularly believed to be true. "Legend" is also used of a writing, inscription, or motto on coins or medals, and in connexion with coats of arms, shields, monuments, &c.

LEGENDRE, ADRIEN MARIE (1752-1833). French mathematician, was born at Paris (or, according to some accounts, at Toulouse) in 1752. He was brought up at Paris, where he completed his studies at the Collège Mazarin. His first published writings consist of articles forming part of the Traité de mécanique (1774) of the Abbé Marie, who was his professor; Legendre's name, however, is not mentioned. Soon afterwards he was appointed professor of mathematics in the École Militaire at Paris, and he was afterwards professor in the École Normale. In 1785 he received the prize from the Berlin Academy for his "Démonstration d'une question de balistique," a memoir relating to the paths of projectiles in a resisting medium. In 1786, this time, wrote his "Recherches sur la figure des planètes," published in the Mémoires of the French Academy, of which he was elected a member in succession to J. le Rond d'Alembert in 1783. He was also appointed a commissioner for connecting geodetically Paris and Greenwich, his colleagues being P. F. A. Méchain and C. F. Cassini de Thury; General William Ray conducted the operations on behalf of England. The French observations were published in 1792 (Exposé des opérations faites en France in 1787 pour la jonction des observateurs de Paris et de Greenwich). During the Revolution, he was one of the three members of the council established to introduce the decimal system, and he was also a member of the commission appointed to determine the length of the metre, for which purpose the calculations, &c., connected with the arch of the meridian from Barcelona to Dunkirk were revised. He was also associated with G. C. F. M. Prony (1755-1839) in the formation of the great French tables of logarithms of numbers, sines, and tangents, and natural sines, called the Tables du Cadastre, in which the quadrant was divided centesimally; these tables have never been published (see LOGARITHMS). He was examiner in the École Polytechnique, but held few important state offices. He died at Paris on the 10th of January 1833, and the discourse at his grave was pronounced by S. D. Poisson. The last of the three supplements to his Traité des fonctions elliptiques was published in 1834, and Poisson in his funeral oration remarked: "M. Legendre a eu cela de commun avec la plupart des géomètres qui l'ont précédé, que ses travaux n'ont fini qu'avec sa vie. Le dernier volume de nos mémoires renferme encore un mémoire de lui, sur une question difficile de la théorie des nombres; et peu de temps avant la maladie qui l'a conduit au tombeau, il se procure les observations les plus récentes des comètes à courtes périodes, dont il allait se servir pour appliquer et perfectionner ses méthodes.

It will be convenient, in giving an account of his writings, to consider them under different subjects which are especially his name.

Elliptic Functions.—This is the subject with which Legendre's name will always be most closely connected, and his researches upon it extend over a period of more than forty years. The first of a series upon the subject was contained in the Mémoires de l'Académie française for 1756 upon elliptic arcs. In 1792 he presented to the Academy a memoir on elliptic transcendents. The contents of these memoirs are included in the first volume of his Exercices de calcul integral (1811). The third volume (1821) contains the very elaborate and now well-known tables of the elliptic integrals which were calculated by Legendre himself, with an account of the mode of their construction. In 1827 appeared the second volume, containing the integrals for the second, third, and fourth orders, and the first four days of the second order, a great part of the first volume agrees very closely with the contents of the Exercices; the tables, &c., are given in the second volume. Three supplements, relating to the researches of C. G. Gaus, with the tables in those orders, and in the second volume, were added. Legendre had pursued the subject which would now become integral elliptic functions only from 1776 to 1827, the results of his labours having been almost entirely neglected by his contemporaries, but his work had scarcely appeared in 1827, when came the discoveries which were independently made by the two young and as yet unknown mathematicians Abel and Jacobi placed the subject on a new basis, and revolutionized it completely. The memoirs with which Legendre, who was then seventy-six years of age, welcomed these important researches, that quite overshadowed his own, and included them in successive supplements to his work, does the highest honour to him (see FUNCTION).

Integrals of the Second Order.—The Exercices de calcul integral consist of three volumes, a great portion of the first and the whole of the third being devoted to elliptic functions. The remainder of the first volume relates to the Eulerian integrals and quadratic equations. The second volume is given to the Eulerian integrals, and to various integrals and series, development, mechanical problems, &c., connected with the integral calculus; this volume contains also a numerical table of the values of the gamma function. The latter portion of the second volume of the Traité des fonctions elliptiques was published in 1830, but the first day of the third volume was the last to be reproduced. Legendre's researches connected with the "gamma function" are of importance, and are well known; the subject was also treated by K. F. Gauss in his memoir Disquisitiones generales circa seriem infinitam (1816), but in a very different manner. The results given in the second volume of the Exercices are of too miscellaneous a character to admit of being briefly described. In 1798 Legendre published a memoir on double integrals, and in 1809 one on spherical integrals.

Theory of Numbers.—Legendre's Théorie des nombres and Gauss's Disquisitiones arithmeticae (1801) are still standard works upon this subject. The first edition of the former appeared in 1798 under the title Essai sur la théorie des nombres; a second edition in 1808; a first supplement was published in 1816, and a second in 1825. The third edition, under the title Théorie des nombres, appeared in 1830 in two volumes. The fourth edition appeared in 1836, in two volumes. In the first edition, as the law of quadratic reciprocity, the most important general result in the science of numbers which has been discovered since the time of P. de Fermat, and which was called by Gauss the "gem of arithmetic," was first proved. It was published in the first volume of the Academy for 1785, but the demonstration that accompanied it was incomplete. The symbol (g/p) which is known as Legendre's symbol, and denotes the positive or negative unit which is the remainder when g/pk is divided by a prime number p, does not appear in this memoir, but was first used in the Essai sur la théorie des nombres. Legendre's formula x2 = (x+1)/8(n) for the approximate number of forms inferior to a given number x was first given by him also in this work (2nd ed., p. 394) (see NUMBER).
Attractions of Ellipsoids.—Legendre was the author of four important memoirs on this subject. In the first of these, entitled "Recherches sur l'attraction des sphéroïdes homogènes," published in the Mémoires of the Academy for 1785, but communicated to it at a much earlier period, he introduced the beautiful idea that, though the coefficients of Laplace's, are not correctly named after Legendre. The definition of the coefficients is that if \( (1 + \cos \phi + \cos^2 \phi) \) be expanded in ascending powers of \( \phi \), and if the coefficients of these powers be denoted by \( a_1, a_2, a_3, \ldots \), then \( a_1, a_2, a_3, \ldots \) are the spherical harmonic coefficients of the fourth order. In this memoir also the function of which is now called the potential, was, at the suggestion of Laplace, first introduced. Legendre shows that Maclaurin's theory with respect to the attraction of a planet about a solid, is only correct when the ellipsoids are solids of revolution. Of this memoir Isaac Todhunter writes: "We may affirm that no single memoir in the history of our subject can rival this in interest and importance. During the first quarter of the 19th century, every mathematician, from d'Alembert, Lagrange, and Laplace, had not carried the theory of the attraction of ellipsoids beyond the point which the geometry of Maclaurin had reached. The introduction of the coefficients now called Laplace's, and their application, commence a new era in mathematical physics." Legendre's second memoir was communicated to the Academy in 1787, and relates to the conditions of equilibrium of a mass of rotating fluid in the form of a figure of revolution which does not deviate much from a sphere. The third memoir relates to Laplace's theory respecting confocal ellipsoids. Of the fourth memoir Todhunter writes: "It occupies an important position in the history of the subject. The most striking addition which had been made to the obvious results of that memoir was the theory of a planet supposed entirely fluid; the general expression for the form of a stratum is given for the first time and discussed. For the first time we have a correct and convenient expression for Laplace's "équation de la figure du globe," and for the first time a dynamical Theories of attraction and the Figure of the Earth (1787), the twentieth, twenty-second, twenty-fourth, and twenty-fifth chapters of which contain a full and correct account of Legendre's fourth memoir."

Geodesy.—Besides the work upon the geodetical operations connecting Paris and Greenwich, of which Legendre was one of the authors, he published in the Mémoires de l'Académie for 1787, two papers, one on the high operation of comparing the standard measures on the ground, the other upon the determination of the figure of the earth, containing many theorems relating to this subject. The best known of these, which is called Legendre's theorem, is usually given in treatises on spherical trigonometry; by means of it a small sphere of terrestrial diameter can be drawn in the place of the plane spherical triangles being applied to the angles. Legendre was also the author of a memoir upon triangles drawn upon a spheroid. Legendre's theorem is a fundamental one in geodesy, and his contributions to the subject are of the greatest importance.

Method of Least Squares.—In 1806 appeared Legendre's Nouvelles Méthodes pour la détermination des orbites des comètes, which is memorable as containing the first published suggestion of the method of least squares. A portion of this work was quoted by Gauss in 1809, and it was found that the estimate for the initial orbit of a comet in 1801, by means of the method of least squares, is more accurate than that by any other previous method. Gauss, in his "Theoria motus", says: "The method of least squares is the more general and the more practical for determining a current orbit from a small number of observations, than to find the orbit of a planet not long since set in its place by the astronomer of a planet newly perturbed.

De cause principiis quæ propòsitum esse potest, esse aقض, nemo sciens, quod hæc est più generalis, e più accurat, ea addita in una circumscribenda plana applicazione del metodo di Laplace e Legendre."

Deuxièmes principes qu'on peut proposer pour cet objet, je pense qu'il n'est pas de plus général, de plus exact, ni d'un usage plus facile que celui dont nous avons fait usage dans les recherches précédentes.

The method was proposed by Legendre only as a convenient process for treating observations, without reference to the theory of probability. It had, however, been applied by Gauss as early as 1795, and the method was largely employed by the French government by the time of the French Revolution.

The Elements of Geometry.—Legendre's name is most widely known on account of his Elements de géométrie, the most successful of all school books ever composed, and the most widely translated. It is well known in England. The English translation, by Sir David Brewster, from the original edition (1806), was published in 1817, and was well received and widely used. The French edition (1817) was revised by Legendre, and published two supplements to his Nouvelles Méthodes de 1806 and 1820.

The French edition (1817) was revised by Legendre, and published two supplements to his Nouvelles Méthodes de 1806 and 1820.
Legge, J.—LEGHORN

Hampshire, a proceeding which greatly incensed the earl of Bute, who desired this seat for one of his friends. Having thus incurred Bute's displeasure Legge was again dismissed from the exchequer in March 1761, but he continued to take part in parliamentary debates until his death at Tunbridge Wells on the 23rd of August 1764. Legge appears to have been a capable financier, and the position of chancellor of the exchequer was not at that time a cabinet office. He took the additional name of Bilson on succeeding to the estates of a relative, Thomas Bettsworth Bilson, in 1754. Pitt called Legge, "the child, and deservedly the favourite child, of the Whigs." Horace Walpole said he was "of a creeping, underhand nature, and aspired to the lion's place by the manoeuvre of the mole," and afterwards he spoke in high terms of his talents. Legge married Mary, daughter and heiress of Edward, 4th and last Baron Stawel (d. 1755). This lady, who died in 1760, was created Baroness Stawel of Somerton, bore him an only child, Henry Stawel Bilson-Legge (1757-1820), who became Baron Stawel on his mother's death in 1780. When Stawel died without sons his title became extinct. His only daughter, Mary (d. 1864), married John Dutton, and Baron Sherborne.

LEGE, JAMES (1618-1663), a British Chinese scholar, was born at Huntly, Aberdeenshire, in 1618, and educated at King's College, Aberdeen. After studying at the Highbury Theological College, London, he went in 1639 as a missionary to the Chinese, but, as China was not yet open to Europeans, he remained at Malacca three years, in charge of the Anglo-Chinese College there. The College was subsequently moved to Hong-Kong, where Legge lived for thirty years. Impressed with the necessity of missionaries being able to comprehend the ideas and culture of the Chinese, he began in 1641 a translation in many volumes of the Chinese classics, a monumental task admirably executed and completed a few years before his death. In 1670 he was made an LL.D. of Aberdeen and in 1684 of Edinburgh University. In 1675 several gentlemen connected with the China trade suggested to the university of Oxford a Chair of Chinese Language and Literature to be occupied by Dr Legge. The university responded liberally, Corpus Christi College contributed the emoluments of a fellowship, and the chair was constituted in 1786. In addition to his other work Legge wrote The Life and Teaching of Confucius (1867); The Life and Teaching of Mencius (1875); The Religions of China (1880); and other books on Chinese literature and religion. He died at Oxford on the 29th of November 1807.

LEGHORN (Ital. Livorno, Fr. Lézurse), a city of Tuscany, Italy, chief town of the province of the same name, which consists of the commune of Leghorn and the islands of Elba and Gorgona. The town is the seat of a bishopric and of a large naval academy—the only one in Italy—and the third largest commercial port in the kingdom, situated on the west coast, 12 m. S.W. of Pisa by rail, 10 m. above sea-level. Pop. (1901) 72,308 (town), 66,528 (commune). It is built along the seashore upon a healthy and fertile tract of land, which forms, as it were, an oasis in a zone of Maremma. Behind is a range of hills, the most conspicuous of which, the Monte Nero, is crowned by a frequented pilgrimage church and also by villas and hotels, to which a funicular railway runs. The town itself is almost entirely modern. The 16th-century Fortezza Vecchia, guarding the harbour, is picturesque, and there is a good bronze statue of the grand duke Ferdinand I. by Pietro Tacca (1577-1640), a pupil of Giovanni da Bologna. The lofty Torre del Marzocco, erected in 1423 by the Florentines, is fine. The façade of the cathedral was designed by Inigo Jones. The old Protestant cemetery contains the tombs of Tobias Smollett (d. 1771) and Francis Horner (d. 1817). There is also a large synagogue founded in 1581. The exchange, the chamber of commerce and the clearing-house (one of the oldest in the world, dating from 1764) are united under one roof in the Palazzo del Commercio, opened in 1907. Several improvements have been carried out in the city and port, and the place is developing rapidly as an industrial centre. The naval academy, formerly established partly at Naples and partly at Genoa, has been transferred to Leghorn. Some of the navigable canals which connected the harbour with the interior of the city have been either modified or filled up. Several streets have been widened, and a road along the shore has been transformed into a fine and shady promenade. Leghorn is the principal sea-bathing resort in this part of Italy, the season lasting from the end of June to the end of August. A spa for the use of the Acque della Salute has been constructed. Leghorn is on the main line from Pisa to Rome; another line runs to Colle Salvetti. A considerable number of important steamship lines call here. The new recalline mole, sanctioned in 1881, has been built out into the sea for a distance of 600 yds. from the old Veglia lighthouse, and the docking basin has been lengthened to 490 ft. Inside the breakwater the depth varies from 10 to 26 ft. The total trade of the port increased from £3,853,593 in 1897 to £6,575,285 in 1905 and £7,000,726 in 1906 (the large increase being mainly due to a rise of over £1,000,000 in imports—mainly of coal, building materials and machinery), the average ratio of imports to exports being as three to two. The imports consist principally of machinery, coal, grain, dried fish, tobacco and hides, and the exports of hemp, hides, olive oil, soap, candied fruit, wine, straw hats, boracic acid, mercury, and marble and alabaster. In 1885 the total number of vessels that entered the port was 4,281 of 1,454,000 tons; of these, 1,251 of 706,000 tons were foreign; 688,000 tons of merchandise were loaded and unloaded. In 1906, after considerable fluctuations during the interval, the total number that entered was 4,623 vessels of 2,372,551 tons; of these, 935 of 1,002,119 tons were foreign; British ships representing about half this tonnage. In 1906 the total imports and exports amounted to 1,470,000 tons including coasting trade. A great obstacle to the development of the port is the absence of modern mechanical appliances for loading and unloading vessels, and of quay space and dock accommodation. The older shipyards have been considerably extended, and shipbuilding is actively carried on, especially by the Orlando yard which builds large ships for the Italian navy, while new industries—namely, glass-making and copper and brass-foundering, electric power works, a cement factory, flour-mills, printing presses, oil-presses, a cotton yarn spinning factory, electric plant works, a shipbuilding yard, a motor-boat yard, &c.—have been established. Other important firms, Tuscan wine-growers, oil-growers, timber dealers, colour manufacturers, &c., have their head offices and stores at Leghorn, with a view to export. The former British "factory" here was of great importance for the trade with the Levant, but was closed in 1825. The two villages of Ardenza and Antignano, which form part of the commune, have acquired considerable importance, the former in part for sea-bathing.

The earliest mention of Leghorn occurs in a document of 891, relating to the first church here; in 1017 it is called a castle. In the 13th century the Pisans tried to attract a population to the spot, but it was not till the 14th that Leghorn became a rival to Pisa. Founded on the mouth of the Arno, which it was destined ultimately to supplant. It was at Leghorn that Urban V. and Gregory XL landed on their return from Avignon. When in 1405 the king of France sold Pisa to the Florentines he kept possession of Leghorn; but he afterwards (1407) sold it for 26,000 ducats to the Genoese, and from the Genoese the Florentines purchased it in 1421. In 1406 the city showed its devotion to its new masters by a successful defence against Maximilian and his allies, but it was still a small place; in 1551 there were only 740 inhabitants. With the rise of the Medici came a rapid increase of prosperity; Cosimo, Francis and Ferdinand erected fortifications and harbour works, warehouses and churches, with equal liberality, and the last especially gave a stimulus to trade by inviting "men of the East and the West, Spanish and Portuguese, Greeks, Germans, Italians, Hebrews, Turks,
Moors, Armenians, Persians and others," to settle and traffic in the city, as it became -/96. Declared free and neutral in 1669, it was used as a refuge, and variously involved with these privileges by the Quadruple Alliance in 1718; but in 1706 Napoleon seized all the hostile vessels in its port. It ceased to be a free city by the law of 1867.

LEGION (Lat. legio), in early Rome, the levy of citizens marching out en masse to war, like the citizen-army of any other primitive state. As Rome came to need more than one army at once and warfare grew more complex, legio came to denote a unit of 2000-6000 heavy infantry (including, however, at first some light infantry and at various times a handful of cavalry) who were by political status Roman citizens and were distinct from the "allies," auxilia, and other troops of the second class. The legionaries were regarded as the best and most characteristic Roman soldiers, the most trustworthy and truly Roman; they enjoyed better pay and conditions of service than the "auxiliaries." In a.d. 14 (death of Augustus) there were 25 such legions; later, the number was slightly increased; finally about a.d. 37 Diocletian reduced the size and greatly increased the number of the legions. Throughout, the dominant features of the legions were heavy infantry and Roman citizenship. They lost their importance when the Barbarian invasions altered the character of ancient warfare and made cavalry a more important arm than infantry, in the late 3rd and 4th centuries a.d. In the middle ages the word "legion" seems not to have been used as a technical term. In modern times it has been employed for organizations of an unusual or exceptional character, such as a corps of foreign volunteers or mercenaries. See further Roman Army.

The term legion has been used to designate regiments or corps of all arms in modern times, perhaps the earliest example of this being the corps de ligne for the Franco-German war at Walcheren. Napoleon, in accordance with this precedent, employed the word to designate the second-line formations which he maintained in France and which supplied the Grande Armée with drafts. The term "Foreign Legion" is often used for irregular volunteer corps of foreign soldiers in armies at war, often by smaller states fighting for independence. Unlike most foreign legions the "British Legion" which, raised in Great Britain and commanded by Sir de Lacy Evans (q.e.), fought in the Carlist war, was a regular corps of British volunteers, but was so badly and incorrectly applied to-day to the Regiments d'Étrangers in the French service, which are composed of adventurist spirits of all nationalities and have been employed in many arduous colonial campaigns.

The most famous of the corps that have borne the name of legion in modern times was the King's German Legion (see Beamish's history of the corps). The electorate of Hanover being in 1805 thrown upon the defensive, and Napoleon being not at all easily considered possible, the British government wished to take the greater part of the Hanoverian army into its service. But the acceptance by the Hanoverian government of this offer was delayed until too late, and it was then found that the French had entered Hanover as the army as a unit had been disbanded that the formation of the "King's German Regiment," as it was at first called, was begun in Engh.

This enlistment of only ex-Hanoverian soldiers, but other Germans as well as individuals, increased the corps. Major Colin Halkett were the officers entrusted with the formation of the new corps, which in January 1805 had become a corps of all arms with the title of King's German Legion. It then consisted of a dragoon regiment a cavalry and a line infantry regiment. The expedition of November 90, the expedition to Copenhagen in 1807, the minor expeditions of the years 1808-14, the expedition to Sweden in 1809, the expedition to Denmark in 1810, the expedition of 1809, the expedition to Sweden under Sir John Moore in 1808, and the expedition in 1813 in northern Germany. But its title to fame is its part in the Peninsula War, in which it first to land, and it bore the brunt of the fighting of the Peninsula; whose services both on reconnaissance and in battle were of the highest value. The exploit of the two dragoon regiments of the Legion at Arcos of Toreno after the battle of Salamanca, where they charged and melted two of the four French divisions, is one of the most notable incidents in the history of the cavalry arm (see Sir E. Wood's Achievements of Cavalry). A general officer of the Legion, Charles Alten (q.e.), commanded the British Light Division in the latter part of the war. It was considered as rather a small army of the British type, most of which served abroad by regiments and battalions while a small portion and depot units were at home, the total numbers under arms being about 25,000. In 1815 the period of service of the corps had almost expired when Napoleon returned from Elba, but its members voluntarily offered to prolong their service. It lost heavy at Waterloo, in which Birin's battalion of the light infantry distinguished itself by its gallant defence of La Haye Sainte. The strength of the Legion at the time of its disbandment was 1100 officers and 23,500 men. A short-lived "King's German Legion" was raised by the British government for service in the Crimean War, but was commanded by the sons of the German army to-day, represent the units of the Legion and carry Panmuse battlehonours on their standards and colours.

LEGITIM, or BAIRN'S PART, in Scots law, the legal share of the movables property of a father due on his death to his children. If a father dies leaving a widow and children, the movable property is divided into three equal parts; one-third part is divided equally among all the children who survive, although they may be of different marriages (the issue of predeceased children do not share); another third goes to the widow as her jus relictue, and the remaining third, called "dead part," may be disposed of by the father by will as he pleases. If the father die intestate the dead part goes to the children as next-of-kin. Should the father leave no widow, one-half of the movable estate is legite and one-half dead part's part. In claiming legitim, however, credit must be given for any advance made by the father out of his movable estate during his lifetime.

LEGITIMACY, and LEGITIMATION, the status derived by individuals in consequence of being born in legal wedlock, and the means by which the same status is given to persons not so born. Under the Roman or civil law a child born before the marriage of the parents was made legitimate by their subsequent marriage. This method of legitimization was accepted by the clergy of England, but was summarily rejected by the law of the parliament of Merton in 1326, when they replied "Legitimation is another measure.

English law takes account solely of the fact of marriage precedes the birth of the child; at whatever period the birth happens after the marriage, the offspring is prima facie legitimate. The presumption of law is always in favour of the legitimacy of the child of a married woman, and at one time it was so strong that Sir Edward Coke held that "if the husband be within the four seas, i.e. within the jurisdiction of the king of England, and the wife hath issue, no proof shall be admitted to prove the child a bastard unless the husband hath an apparent impossibility of procreation." It is now settled, however, that the presumption of legitimacy may be rebutted by evidence showing non-access on the part of the husband, or any other circumstance showing that the husband could not in the course of nature have been the father of his wife's child. If the husband had access, or the access be not clearly negatived, even though others at the time were carrying on illicit intercourse with the wife, a child born under such circumstances is legitimate. If the husband had access intercourse must be presumed, unless there is irresistible evidence to the contrary. Neither husband or wife will be permitted to prove the non-access directly or indirectly.

Children born after a divorce a mensa et thoro will, however, be presumed to be bastards unless access be proved. A child born so long after the death of a husband that he could not in the ordinary course of nature have been the father is illegitimate. The period of gestation is presumed to be "about nine" calendar months; and if there were any circumstances from which an unusually long or short period of gestation could be inferred, special medical testimony would be required.

A marriage between persons within the prohibited degrees of affinity was before 1835 not void, but only voidable, and the ecclesiastical courts were restrained from bastardizing the issue after the death of either of the parents. Lord
Lyndhurst's act (1835) declared all such existing marriages valid, but all subsequent marriages between persons within the prohibited degrees of consanguinity or affinity were made null and void and the issue illegitimate (see Marriage). By the Legitimacy Act 1858, application may be made to the Probate, Divorce and Admiralty Court (in Scotland, to the Court of Session by action of declarator) for a declaration of legitimacy and of the validity of a marriage. The status of legitimacy in any country depending upon the fact of the child having been born in wedlock, it may be concluded that any question as to the legitimacy of a child turns either on the validity of the marriage or on whether the child has been born in wedlock.

Legitimation effected by the subsequent marriage of the parents of the illegitimate child is technically known as legitimation per subsequens matrimonium. This adoption of the Roman law principle is followed by most of the states of the continent of Europe (with distinctions, of course, as to certain illegitimate children, or as to the forms of acknowledgment by the parent or parents). In the Isle of Man, Guernsey, Jersey, Lower Canada, St. Lucia, Trinidad, Demerara, Berbice, Cape Colony, Ceylon, Mauritius; it has been adopted in New Zealand (Legitimation Act 1804), South Australia (Legitimation Act 1808, amended 1901), Queensland (Legitimation Act 1809), New South Wales (Legitimation Act 1902), and Victoria (Registration of Births, Deaths and Marriage Acts 1903). It is to be noted, however, that in these states the mere fact of the parents marrying does not legitimize the child; indeed, the parents may marry, yet the child remain illegitimate. In order to legitimize the child it is necessary for the father to make application for its registration; in South Australia, the application must be made by both parents; so also in Victoria, if the mother is living, if not, application by the father will suffice. In New Zealand, Queensland and New South Wales, registration may be made at any time after the marriage; in Victoria, within six months from the date of the marriage; in South Australia, by the act of 1898. registration was permissible only within thirty days before or after the marriage. But by the amending act of 1902 it is allowed at any time more than thirty days after the marriage, provided the applicants prove before a magistrate that they are the parents of the child. In all cases the legitimation is retrospective, taking effect from the birth of the child. Legitimation by subsequent marriage exists also in the following states of the American Union: Maine, Pennsylvania, Illinois, Michigan, Iowa, Minnesota, California, Oregon, Nevada, Washington, N. and S. Dakota, Idaho, Montana and New Mexico. In Massachusetts, Vermont, Illinois, Indiana, Wisconsin, Nebraska, Maryland, Virginia, West Virginia, Kentucky, Missouri, Arkansas, Texas, Colorado, Idaho, Wyoming, Georgia, Alabama, Mississippi and Arizona, in addition to the marriage the father must recognize or acknowledge the illegitimate child as his. In New Hampshire, Connecticut and Louisiana both parents must acknowledge the child, either by an authentic act before marriage or by the contract of marriage. In some states (California, Nevada, N. and S. Dakota and Idaho) if the father of an illegitimate child receives it into his house (with the consent of his wife, if married), and treat it as if it were legitimate, it becomes legitimate for all purposes. In other states (N. Carolina, Tennessee, Georgia and New Mexico) the putative father can legitimize the child by process in court. Those states of the United States which have not been mentioned follow the English common law, which also prevails in Ireland, some of the West Indies and part of Canada. In Scotland, on the other hand, the principle of the civil law is followed. In Scotland, bastards could be legitimized in two ways: either by the subsequent intermarriage of the mother of the child with the father, or by letters of legitimation from the sovereign. With respect to the last, however, it is to be observed that letters of legitimation, be their clauses ever so strong, could not enable the bastard to succeed to his natural father; for the sovereign could not, by any prerogative, cut off the private right of third parties. But by a special clause in the letters of legitimation, the sovereign could renounce his right to the bastard's succession, failing legitimate descendants, in favour of him who would have been the bastard's heir had he been born in lawful wedlock, such renunciation encroaching upon no right competent to any third person.

The question remains, how far, if at all, English law recognizes the legitimacy of a person born out of wedlock. Strictly speaking, English law does not recognize any such person as legitimate (though the supreme power of an act of parliament can, of course, confer the rights of legitimacy), but under certain circumstances it will recognize, for purposes of succession to property, a legitimated person as legitimate. The general maxim of law is that the status of legitimacy must be tried by the law of the country where it originates, and where the law of the father's domicile at the time of the child's birth, and of the father's domicile at the time of the subsequent marriage, taken together, legitimize the child, English law will recognize the legitimacy. For purposes of succession to real property, however, legitimacy must be determined by the lex loci rei sitae; so that, for example, a legitimized Scotsman would be recognized as legitimate in England, but not legitimate so far as to take lands as heir (Birchwhistle v. Vardill, 1849). The conflict of laws on the subject yields some curious results. Thus, a domiciled Scotsman had a son born in Scotland and then married the mother in Scotland. The son died possessed of land in England, and it was held that the father could not inherit from the son. On the other hand, where an unmarried woman, domiciled in England died intestate there, it was held that her brother's daughter, born before marriage, but whilst the father was domiciled in Holland, and legitimized by the parents' marriage while they were still domiciled in Holland, was entitled to succeed to the personal property of her aunt (In re Goodman's Trusts, 1880). In re Grey's Trusts (1892) decided that, where real estate was bequeathed to the children of a person domiciled in a foreign country and these children were legitimized by the subsequent marriage in that country of their father with their mother, that they were entitled to share as legitimate children in a devise of English realty. It is to be noted that this decision does not clash with that of Birchwhistle v. Vardill.

LEGITIMISTS (Fr. légistes, from légitime, lawful, legitimate), the name of the party in France which after the revolution of 1830 continued to support the claims of the elder line of the house of Bourbon as the legitimate sovereigns "by divine right." The death of the comte de Chambord in 1883 dissolved the parti légitimiste, only an insignificant remnant, known as the Blancs d'Espagne, repudiating the act of renunciation of Philip V. of Spain and upholding the rights of the Bourbons of the line of Anjou. The word légitimate was not admitted by the French Academy until 1878; but meanwhile it had spread beyond France, and the English word legitimist is now applied to any supporter of monarchical authority in any other title.

LEGNANO, a fortified town of Venetia, Italy, in the province of Verona, on the Adige, 29 m. by rail E. of Mantua, 52 ft. above sea-level. Pop. (1900) 27,000 (town), 17,000 (commune). Legnano is one of the famous Quadrilateral fortresses. The present fortifications were planned and made in 1815, the older defences having been destroyed by Napoleon I. in 1801. The situation is low and unhealthy, but the territory is fertile, rice, cereals and sugar being grown. Legnano is the birthplace of G. B. Cavalcaselle, the art historian (1827-1897). A branch line runs hence to Rovigo.

LEGNAO, a town of Lombardy, Italy, in the province of Milan, 17 m. N.W. of that city by rail, 682 ft. above sea-level. Pop. (1881) 7,153 (1901) 8,285. The church of St. Magno, built in the style of Bramante by G. Lampugnano (1504-1530), contains an altar-piece considered one of Lùini's best works. There are also remains of a castle of the Visconti. Legnano is the seat of important cotton and silk industries, with
LEGOUVÉ—LEGROS

machine-shops, boiler-works, and dyeing and printing of woolen goods, and thread. Close by, the Lombard League defeated Frederick Barbarossa in 1176; a monument in commemoration of the battle was erected on the field in 1876, while there is another by Butti erected in 1900 in the Piazza Federico Barbarossa.

LEGOUVÉ, GABRIEL JEAN BAPTISTE ERNEST WILFRID (1807-1903). French dramatist, son of the poet Gabriel Legouvé (1764-1821), who wrote a pastoral La Mort d’Abel (1793) and a tragedy of Epicharis et Néro, was born in Paris on the 5th of February 1807. His mother died in 1810, and almost immediately afterwards his father was removed to a lunatic asylum. The child, however, inherited a considerable fortune, and was carefully educated. Jean Nicolas Bouilly (1763-1842) was his tutor, and early instilled into the young Legouvé a passion for literature, to which the example of his father and of his grandfather, J. B. Legouvé (1729-1832), predisposed him.

As early as 1820 he carried away a prize of the French Academy for a poem on the discovery of printing; and in 1832 he published a curious little volume of verses, entitled Les Morts Bizarres. In those early days Legouvé brought out a succession of novels, of which Edith de Falsen enjoyed a considerable success. In 1847 he began the work by which he is best remembered, his contributions to the development and education of the female mind, by lecturing at the College of France on the moral history of women: these discourses were collected into a volume in 1848, and enjoyed a great success. Legouvé wrote considerably for the stage, and in 1849 he collaborated with A. E. Scribe in Adrienne Lecouvreur. In 1853 he brought out his tragedy of Médée, the success of which had much to do with his election to the French Academy. He succeeded to the fauteuil of J. A. Ancelot, and was received by Fiourens, who dwelt on the plays of Legouvé as his principal claim to consideration. As time passed on, however, he became less prominent as a playwright, and more so as a lecturer and propagandist on the woman’s advanced education of children, in both of which directions he was a pioneer in French society. His La Femme en France au XIXe siècle (1864), reissued, much enlarged, in 1878; his Messieurs les enfants (1868), his Conférences Parisiennes (1872), his Nos filles et nos fils (1877), and his Une Education de jeune fille (1884) were works of wide-reaching influence in the moral order. In 1886-1887 he published, in two volumes, his Soixante ans de souvenirs, an excellent specimen of autobiography.

He was raised in 1887 to the highest grade of the Legion of Honour, and held for many years the post of inspector-general of female education in the national schools. Legouvé was always an advocate of physical training. He was long accounted one of the best shots in France, and although, from a conscientious objection, he never fought a duel, he made the art of fencing his lifelong hobby. After the death of Désiré Nisard in 1888, Legouvé became the “father” of the French Academy. He died on the 14th of March 1903.

LEGROS, ALPHONSE (1837— ), painter and etcher, was born at Dijon on the 8th of May 1837. His father was an accountant, and came from the neighbouring village of Veronneux. Young Legros frequently visited the farms of his relatives, and the peasants and landscapes of that part of France are the subjects of many of his pictures and etchings. He was sent to the art school at Dijon with a view to qualifying for a trade, and was apprenticed to Malte Nicolardo, house decorator and painter of images. In 1851 Legros left for Paris to take another situation; but passing through Lyons he worked for six months as journeyman wall-painter under the decorator Bechot, who was painting the chapel of Cardinal Bonaparte in the church of St. John the Baptist. In Paris he studied with Cambon, scene-painter and decorator of theatres, an experience which developed a breadth of touch such as Stanfield and Cox picked up in similar circumstances. At this time he attended the drawing-school of Lecq de Boisbaudran. In 1852 Legros attended the evening classes of the École des Beaux Arts, and perhaps gained there his love of drawing from the antique, some of the results of which may be seen in the Print Room of the British Museum. He sent two portraits to the Salon of 1857; one was rejected, and formed part of the exhibition of protest organized by Bonvin in his studio; the other, which was accepted, was a profile portrait of his father. This work was presented to the museum at Tours by the artist, when his friend Cazin was organizing Châtelieu.

Development of Legros’s work in the Salon, and sought out the artist to enlist him in the small army of so-called “Realists,” comprising (round the noisy glory of Courbet) all those who raised protest against the academical trifles of the degenerate Romantics. In 1859 Legros’s “Angels” was exhibited, the first of those quiet church interiors, with kneeling figures of patient women, by which he is best known as a painter. “Ex Voto,” a work of more power and insight, painted in 1861, now in the museum at Dijon, was received by his friends with enthusiasm, but it only obtained a mention at the Salon. Legros came to England in 1863, and in 1864 married Miss Frances Rosetta Hodgson. At first he lived by his etching and teaching. He then became teacher of etching at the South Kensington School of Art, and in 1876 Slade Professor at University College, London. He was naturalized as an Englishman in 1881, and remained at the Slade School until his death. He also exerted to encourage a certain distinction, severity and truth of character in the work of his pupils, with a simple technique and a respect for the traditions of the old masters, until then somewhat foreign to English art. He would draw or paint a torso or a head before the students in an hour or even less, so that the attention of the pupils might not be dulled. As students had been known to take weeks and even months over a single drawing, Legros ordered the positions of the casts in the Antique School to be changed once every week. In the painting school he insisted upon a good outline, preserved by a thin rub in ofumber, and then the work was to be finished in a single painting, “premier coup.” Experiments in all varieties of art work were practised; whenever the professor saw a fine example in the museum, when a process interested him in his workshop, he never rested until he had mastered the technical, and his students were trying their ‘prentice hands at it. As he had casually picked up the art of etching by watching a comrade in Paris working at a commercial engraving, so he began the making of medals after a walk in the British Museum, studying the masterpieces of Pisanello, and a visit to the Cabinet des Médailles in Paris. Legros considered the traditional journey to Italy a very important part of artistic training, and in order that his students should have the benefit of such study he devoted a part of his salary to augment the income available for a travelling studentship. His later works, after he resigned his professorship in 1892, were more in the free and ardent manner of his early days—imaginative landscapes, castles in Spain, and farms in Burgundy, etchings like the series of the Triumph of Death.”

LEGUMINOSAE, the second largest family of seed-plants, containing about 430 genera with 7000 species. It belongs to the series Rosales of the Dicotyledons, and contains three well-marked suborders, Papilionatae, Mimosoideae and Caesalpinioideae. The plants are trees, shrubs or herbs of very various habit. The British representatives, all of which belong to the suborder Papilionatae, include a few shrubs such as **Ulex** (gorse, furze), **Cytisus** (broom) and **Genista**, but the majority, and this applies to the suborder as a whole, are herbs, such as the clovers, **Medicago**, **Melilotus**, &c., sometimes climbing by aid of tendrils which are modified leaf-structures, as in **Lathyrus** and the vetches (**Vicia**). Scarlet runner (**Phaseolus multiformis**) has a herbaceous twining stem. Woody climbers (laines) are represented by species of **Bauhinia** (Caesalpinioideae), with their curiously flattened twisted stems are characteristic features of tropical forests, and **Entada scandens** (Mimosoideae) also common in the tropics; these two suborders, which are confined to the warmer parts of the earth, consist chiefly of trees and shrubs such as **Acacia** and **Mimosa** belonging to the Mimosoideae, and the Judas tree of southern Europe (**Cercis**) and tamarind belonging to the Caesalpinioideae. The so-called acacia of European gardens (**Robinia Pseudacacia**) and laburnum are examples of the tree habit in the Papilionatae. Water plants are rare, but are represented by **Aeschynomene** and **Nepisia**.

The roots of many species bear nodular swellings (tubercles), the cells of which contain bacterium-like bodies which have the power of fixing the nitrogen of the atmosphere in such a form as to make it available for plant food. Hence the value of these plants as a crop on poor soil or as a member of a series of rotation of crops, since they enrich the soil by the nitrogen liberated by the decay of their roots or of the whole plant if ploughed in as green manure.

The leaves are alternate in arrangement and generally compound and stipulate. A common form is illustrated by the trefoil or cavers, which have three leaflets springing from a common point (digitately trifoliate); pinnate leaves are also frequent as in laburnum and **Robinia**. In Mimosoideae the leaves are generally bipinnate (figs. 1, 2, 3). Rarely are the leaves simple as in **Bauhinia**. Various departures from the usual leaf-type occur in association with adaptations to different functions or environments. In leaf-climbers, such as pea or vetch, the end of the rachis and one or more pairs of leaflets are changed into tendrils. In *gorse* the leaf is reduced to a slender spine-like structure, though the leaves of the seedling have one to three leaflets.

In many Australian acacias the leaf surface in the adult plant is much reduced, the petiole being at the same time flattened and enlarged (fig. 1), frequently the leaf is reduced to a petiole flattened in the vertical plane; by this means a minimum surface is exposed to the intense sunlight. In the garden pea the stipules are large and foliaceous, replacing the leaflets, which are tendril-like; in **Robinia** the stipules are spiny and persist after leaf-fall. In some **acacias** the thorns are hollow and inhabited by ants as in *A. sphaerocephala*, a central American plant (fig. 2) and others. In some species of **Astragalus**, **Onobrychis** and others, the leaf-stalk persists after the fall of the leaf and becomes hard and spiny.

Leaf-movements occur in many of the genera. Such are the sleep-movement in the clovers, runner bean (**Phaseolus**), **Robinia** and **acacia**, where the leaflets assume a vertical position at nightfall. Spontaneous movements are exemplified in the telegraph-plant (**Desmodium gyranus**), native of tropical Asia, where the small lateral leaflets move up and down every few minutes. The sensitive plant (**Mimosa pudica**) is an example of movement in response to contact, the leaves assuming a sleep-position if touched. The seat of the movement is the swollen base of the leaf-stalk, the so-called pulvinus (fig. 3). The stem of the lances shows some remarkable deviations from the normal in form and structure. In Papilionatae anomalous secondary thickening arises from the production of new cambium zones outside the original ring (**Mucuna, Wisteria**) forming concentric rings or transverse or broader strands; where, as in **Rhynchosia** the successive cambiums are active only at two opposite points, a flat ribbon-like stem is produced. The climbing **Bauhinias** (**Caesalpinioideae**) have a flattened stem with basillike undulations; in some growth in thickness is normal, in others new cambium zones are found concentrically, while in others new and distinct growth-centres arise outside the cambium-zone, each with its own cambium-zone, to arise outside the primary zone. The climbing **Mimosoideae** show no anomalous growth in thickness, but in some cases the stem becomes strongly winged. Gum passages in the pith and medullary rays occur, especially in species of **acacia** and **Astragalus**; gum-arabic is an exudation from the branches of **Acacia Senegal**, gum-tragacanth from **Astragalus gummifer** and other species. Logwood is the coloured h-wood of **Haematoxylyn campeachianum**; red sandalwood of **Pterocarpus santalinus**.

The flowers are arranged in racemose inflorescences, such as the simple raceme (**Lathyrus, Robinia**), which is condensed to a head in **Trifolium**; in **Acacia** and **Mimosa** the flowers are densely crowded (fig. 4). The flower is characterized by a hypogynous or slightly perigynous arrangement of parts, the anterior position of the odd sepal, the free petals, and the single median carpel with a terminal style, simple stigmas and two
alternating rows of ovules on the ventral suture of the ovary which faces the back of the flower.

The arrangement of the petals and the number and suture of the ovary vary in the three suborders. In Mimosoideae, the smallest of the three, the flower is regular (fig. 4 [3]), and the sepals and petals have a valvate aestivation, and are generally pentamorous, but 3-6-merous flowers also occur. The sepals are more or less united into a cup (fig. 4 [2]), and the petals sometimes cohere at the base. The stamens vary widely in number and cohesion; in Acacia (fig. 4) they are indefinite and free, in the tribe Ingeae, indefinite and monadelphous, in other tribes as many or twice as many as the petals. Frequently, as in Mimosa, the long yellow stamens are the most conspicuous feature of the flower. In Caesalpinioideae (fig. 5) the flowers are zygomorphic in a median plane and generally pentameres. The sepals are free, or the two upper ones united as in tamarind, and imbricate in aestivation, rarely as in the Judas-tree (fig. 5 [2]), valvate. The corolla shows great variety in form; it is imbricate in aestivation, the posterior petal being innermost. In Cercis (fig. 5) it clearly resembles the papilionaceous type; the odd petal stands erect, the median pair are reflexed and wing-like, and the lower pair enclose the essential organs. In Cassia all five petals are subequal and spreading; in Amherstia the anterior pair are small or absent while the three upper ones are large; in Krameria, the anterior pair are represented by glandular scales, and in Tamarindus are suppressed. Apetalous flowers occur in Copaifera and Ceratoia. The stamens, generally ten in number, are free, as in Cercis (fig. 5) or more or less united as in Amherstia, where the posterior one is free and the rest are united. In tamarind only three stamens are fertile. The largest suborder, Papilionaceae, has a flower zygomorphic in the median plane (figs. 6, 7). The five sepals are generally united (figs. 7, 9), and have an ascending imbricate arrangement (fig. 6); the calyx is often two-lipped (fig. 9 [1]). The corolla has five unequal petals with a descending imbricate arrangement; the upper and largest, the standard (vexillum), stands erect, the lateral pair, the wings or alae, are long-clawed, while the anterior pair cohere to form the keel or corona, in which are enclosed the stamens and pistil. The ten stamens are monadelphous as in gorse or broom (fig. 9), or diadelphous as in sweet pea (fig. 8) (the posterior one being free), or almost or quite free; these differences are associated with differences in the methods of pollination. The ten stamens here, as in the last suborder, though arranged in a single whorl, arise in two series, the five opposite the sepals arising first. The carpel is sometimes stalked and often surrounded at the base by a honey-secreting disk; the style is terminal and in the zygomorphic flowers is often curved and somewhat flattened with a definite back and front. Sometimes as in species of Trifolium and Medicago the ovules are reduced to one. The pod or legume splits along both sutures (fig. 10) into a pair of membranous, leathery or sometimes fleshy valves, bearing the seeds on the ventral suture. Dehiscence is often explosive, the valves separating elastically and twisting spirally, thus shooting out the seeds, as in gorse, broom and others. In Desmodium, Entada and others the pod is constricted between each seed, and breaks up into indehiscent one-seeded parts; it is then called a lomentum (fig. 11); in Aistrogastrus it is divided by a longitudinal septum. The pods show a very great variety in form and size. Thus in the clovers they are a small fraction of an inch, while in the common tropical climber Entada scandens they are woody structures more than a yard long and several inches wide. They are generally more or less flattened, but sometimes round and rod-like, as in species of Cassia, or are spirally coiled as in Medicago. Indehiscent one-seeded pods occur in species of clover and in Medicago, also in Dalbergia and allied genera, where they are winged. In Colutea, the bladder-seenna of gardens, the pod forms an inflated bladder which bursts under pressure; it often becomes detached and is blown some distance before bursting. An acicular outgrowth is often developed on the funicle, and is sometimes brightly coloured, rendering the seed conspicuous and favouring dissemination by birds; in such cases the seed-coat is hard. In other cases the hard seed-coat itself is brightly coloured as in the scarlet seeds of Abrus precatorius, the so-called monkey-pod or weaver-plant. Animals also act as the agents of distribution in the superior, one inferior, ovum corolla, with one petal superior, st, the standard (vexillum), one inferior, petal, p, one superior, two inferior, and two lateral; ten stamens in two rows, a, and one carpel, c. The calyx is marked 6.

**Fig. 4.**—Acacia obcola, flowering branch about 1/4 natural size. 
1. Part of stem with leaf and its subtended inflorescence, about natural size. 
2. Flower, much enlarged. 
3. Floral diagram of Acacia latifolia. (After Eichler.)

**Fig. 5.**—Flowering branch of Judas-tree (Cercis siliquastrum) reduced. 1. Flower, natural size. 2. Floral diagram. 

**Fig. 6.**—Diagram of Flower of Sweet Pea (Lathyrus), showing five petals, s, two are long-clawed, the other three imbricate; two lateral; one inferior, vexillum, with one petal superior, st, the standard (vexillum), one inferior, petal, p, one superior, two inferior, and two lateral; ten stamens in two rows, a, and one carpel, c. The calyx is marked 6.

**Fig. 7.**—Flower of Pea (Pisum sativum), showing a papilionaceous flower, with five petals, a, two lateral, one inferior, corolla, with one petal superior, st, the standard (vexillum), two inferior, cor, the keel (carina), and two lateral, a, wings (alae). The calyx is marked 6.
are freely exposed and the conspicuous coloured stamens serve as well as the petals to attract insects; in *Mimosa* and *Acacia* the flowers are crowded in conspicuous heads or spikes. The relation of insects to the flower has been carefully studied in the Papilionatae, chiefly in European species. Where honey is present it is secreted on the inside of the base of the stamens and accumulated in the base of the tube formed by the united filaments around the ovary. It is accessible only to insects with long proboscides, such as bees. In these cases the posterior stamen is free, allowing access to the honey. The flowers stand more or less horizontally; the large erect white or coloured standard renders them conspicuous, the wings form a platform on which the insect rests and the keel encloses the stamens and pistil, protecting them from rain and the attacks of unbidden pollen-eating insects. In his book on the fertilization of flowers, Hermann Müller distinguishes four types of papilionaceous flowers according to the way in which the pollen is applied to the bee:

1. Those in which the stamens and stigma return within the carina and thus admit of repeated visits, such are the clovers, *Melilotus* and laburnum. (2) Explosive flowers where stamens

Fig. 8.—Stamens and Pistil of Sweet Pea (*Lathyrus*). The stamens are diadelphous, nine of them being united by their filaments, while the supernumerary one (e) is free; stigma, calyx.

Fig. 9.—Broom (*Cytisus scoparius*). (2-7 slightly reduced.)

and style are confined within the keel under tension and the pressure of the insect causes their sudden release and the scattering of the pollen, as in broom and *Genista*; these contain no honey but are visited for the sake of the pollen. (3) The piston-mechanism as in bird's-foot trefoil (*Lotus corniculatus*), *Antirrhinum*, *Ononis* and *Lupinus*, where the pressure of the bee upon the carina while probing for honey squeezes a narrow ribbon of pollen through the opening at the tip. The pollen has been shed into the cone-like tip of the carina, and the heads of the five outer stamens form a piston beneath it, pushing it out at the tip when pressure is exerted on the keel; a further pressure causes the protrusion of the stigma, which is thus brought in contact with the insect's belly. (4) The style bears a brush of hairs which sweeps small quantities of pollen out of the tip of the carina, as in *Lotus*.

Leguminosae is a cosmopolitan order, and often affords a characteristic feature of the vegetation. Mimosoideae and Caesalpinioideae are richly developed in the tropical rain forests, where *Papilionatae* are less conspicuous and mostly herbaceous; in subtropical forests arborescent forms of all three suborders occur. In the temperate regions, tree-forms are rare — thus Mimosoideae are unrepresented in Europe; Caesalpinioideae are represented by species of *Cercis*, *Gymnocladus* and *Gleditschis*; *Papilionatae* by *Robinia*; but herbaceous *Papilionatae* abound and penetrate to the limit of growth of seed-plants in arctic and high alpine regions. Shrubs and under-shrubs, such as *Ulex*, *Genista*, *Cytisus* are a characteristic feature in Europe and the Mediterranean area. *Acacias* are an important constituent of the evergreen bush-vegetation of Australia, together with genera of the tribe *Podalyrieae* of *Papilionatae* (*Chorizema*, *Oxylolium*, &c.). *Asaragulus*, *Oxytropis*, *Hedysarum*, *Onobrychis* and others are characteristic of the steppe-formations of eastern Europe and western Asia.

The order is a most important one economically. The seeds, which are rich in starch and proteids, form valuable foods, as in pea, the various beans, *Vetch*, lentil, ground-nut (*Arachis*) and others; seeds of *Arachis hypogaea* (soya bean), *Papilionaceae*, the Calabar or soya bean, contain a strong poison. Many are useful fodder-plants, as the clovers (*Trifolium*) (q.v.), *Medicago* (e.g. *M. sativa*, *lucerne* (q.v.), or alfalfa); *Melilotus*, *Vicia*, *Onobrychis* (*O. sativa* is saffron, *q.v.*); species of *Trifolium*, lupine and others are used as green manure. Many of the tropical trees afford useful timber; *Crotalaria*, *Sesbania*, *Aschynomene* and others yield fibre; species of *Acacia* and *Astragalus* yield gum; *Copaeosa*, *Hymenaea* and others balsams and resins; dyestuffs are obtained from *Genista* (yellow), *Indigofera* (blue) and others; *Ichnanthaxylon campechianum* is logwood; of medicinal value are species of *Cassia* (senna leaves) and *Astragalus*; *Tamarindus indica* is tamarind, *Glycyrrhis glabra* yields liquorice root. Well-known ornamental trees and shrubs are *Cercis* (*ceiba* or the Judas-tree), *Gleditschia*, *Genista*, *Cytisus* (broom), *Colutea* (*C. arborescens* is bladder-senna), *Robinia* and *Acacia*; *Wisteria sinensis*, a native of China, is a well-known climbing shrub; *Phascolus multigerus* is the scarlet runner; *Lathy-

broke out, and reduced the population to a few hundreds. In 1901 it had risen again to 25,814. About seven-ninths of the land under cultivation consists of wet rice cultivation. A certain amount of upland rice is also cultivated, and cotton, sugar-cane, and garden produce make up the rest; recently large orange groves have been planted in the west of the state. Lahka, the capital, is noted for its iron-work, both the iron and the implements made being produced at Pang Lông in the west of the state. This and lacquer-ware are the chief exports, as also a considerable amount of pottery. The imports are chiefly cotton piece-goods and salt. The general character of the state is that of an undulating plateau, with a broad plain near the capital and along the Nam Têng, which is the chief river, with a general altitude of a little under 3,000 ft.

LEH, the capital of Ladakh, India, situated 4 m. from the right bank of the upper Indus 11,500 ft. above the sea, 243 m. from Srinagar and 482 m. from Yarkand. It is the greatest emporium of the trade which passes between India, Chinese Turkestan and Tibet. Here meet the routes leading from the central Asian khanates, Kashgar, Yarkand, Khotan and Lhasa. The two chief roads from Leh to India pass via Srinagar and through the Kulu valley respectively. Under a commercial treaty with the maharaja of Kashmir, a British officer is deputed to Leh to visit the maharaja at the time of theBuff day with the governor appointed by the Kashmir state. Lying upon the western border of Tibet, Leh has formed the starting-point of many an adventurous journey into that country, the best-known route being that called the Janglam, the great trade route to Lhasa and China, passing by the Manasarowar lakes and the Lamia La pass into the valley of the Tsanpo. Pop. (1901) 2079. A Moravian mission has long been established here, with an efficient little hospital. There is also a meteorological observatory, the most elevated in Asia, where the average mean temperature ranges from 19° in January to 64° in July. The annual rainfall is only 3 in.

LEHMANN, JOHANN GOTTLÖB (1722-1770), German mineralogist and geologist, was educated at Berlin where he took his degree of doctor of medicine. He became a teacher of mineralogy and mining in that city, and was afterwards (1761) appointed professor of chemistry and director of the imperial museum at St Petersburg. While distinguished for his chemical and mineralogical researches, he may also be regarded as one of the pioneers in geology in general. Although he accepted the universal deluge, he gave in 1756 careful descriptions of the rocks and stratified formations in Prussia, and introduced the now familiar terms Zechstein and Rothe Toddliegende (Rothliegende) for subdivisions of the strata since grouped as Permian. His chief observations were published in Versuch einer Geschichte von Flöß-Gäbern, betreffend deren Entstehung, Lage, darinlie befindliche Metallen, Mineralien und Fossilien (1756). He died at St Petersburg on the 22nd of January 1767.

LEHMANN, PETER MARTIN ORLA (1850-1870), Danish statesman, was born at Copenhagen on the 15th of May 1810. Although of German extraction his sympathies were with the Danish national party and he contributed to the liberal journal the Kjøbenhavnsposten while he was a student of law at the university of Copenhagen, and from 1839 to 1842 edited, with Christian N. David, the Fædrelandet. In 1842 he was condemned to three months' imprisonment for a radical speech. He took a considerable part in the demonstrations of 1848, and was regarded as the leader of the "Eiderdänen," that is, of the party which regarded the Eider as the boundary of Denmark, and the Eider delta the capital of the kingdom. He entered the cabinet of Count A. W. Molke in March 1848, and was employed on diplomatic missions to London and Berlin in connexion with the Schleswig-Holstein question. He was for some months in 1849 a prisoner of the Schleswig-Holsteiners at Gottorp. A member of the Folketing from 1851 to 1853, of the Landsting from 1854 to 1870, and from 1856 to 1866 of the Reichsrat, he became minister of the interior in 1861 in the cabinet of K. C. Hall, retiring with him in 1863. He died at Copenhagen on the 13th of September 1870. His book On the

Causes of the Misfortunes of Denmark (1864) went through many editions, and his posthumous works were published in 4 vols., 1871.

LEHNIN, a village and health resort of Germany, in the Prussian province of Brandenburg, situated between two lakes, which are connected by the navigable Emster with the Havel, 12 m. S.W. from Potsdam, and with a station on the main line Berlin-Magdeburg, and a branch line to Grosskreutz. Pop. 1900 2370. It contains the ruins of a Cistercian monastery called Himmelpfort am See, founded in 1180 and dissolved in 1542; a handsome parish church, formerly the monastical chapel, restored in 1872-1877; and a fine statue of the emperor Frederick III. Boat-building and saw-milling are the chief industries.

See Hefter, Geschichte des Klosters Lehnin (Brandenburg, 1851); and Sello, Lehnin, Beiträge zur Geschichte von Kloster und Ami (Berlin, 1881).

The LEHNIN PROPHECY (Lehningische Weissagung, Vaticinium Lehninense), a poem in 100 Leonine verses, reputed to be from the pen of a monk, Hermann of Lehnin, who lived about the year 1300, made its appearance about 1650 and caused much controversy. This so-called prophecy bewails the extinction of the Ascanian rulers of Brandenburg and the rise of the Hohenzollern dynasty to power; each successive ruler of the latter house down to the eleventh generation is described, the date of the extinction of the race fixed, and the restoration of the Roman Catholic Church forecast. Since the phraseology is only exact in details down to the death of Frederick William, the great elector, in 1688, and as all prophecies of the period subsequent to that time were falsified by events, the poem came to be regarded as a compilation and the date of its authorship placed about the year 1684. Andreae Fromm (d. 1685), rector of St Peter's church in Berlin, an ardent Lutheran, is commonly believed to have been the forger. This cleric, resisting certain measures taken by the great elector against the Lutheran pastors, fled the country in 1668 to avoid prosecution, and having been received at Prague into the Roman Catholic Church was appointed canon of Leitmeritz in Bohemia, where he died. During the earlier part of the 19th century the poem was eagerly scanned by the enemies of the Hohenzollerns, some of whom believed that the race would end with King Frederick William III., the representative of the eleventh generation of the family.

The prophecy was first published in Liliencron's Gelehrtes Preussen (Königberg, 1823), and has been many times reprinted. See Boost, Die Weissagung des Monches Hermann zu Lehnin (Augsburg, 1848); Hilgenfeld, Die Lehningische Weissagung (Leipzig, 1875); Sabell, Literatur der sogenannten Lehningischen Weissagung (Heilbronn, 1879) and Kampers, Die Lehningische Weissagung über das Haus Hohenzollern (Münster, 1897).

LEHRS, KARL (1802-1878), German classical scholar, was born at Königsberg on the 2nd of June 1802. He was of Jewish extraction, but in 1822 he embraced Christianity. In 1845 he was appointed professor of ancient Greek philology in Königsberg University, which post he held till his death on the 9th of June 1878. His most important works are: De Aristarchi Studii Homerici (1833, 2nd ed. by A. Ludwich, 1882), which laid a new foundation for Homeric exegesis (on the Aristarchean lines of explaining Homer from the text itself) and textual criticism; Quaestiones Epichea (1837); De Asclepiade Myreanae (1845); Herodiani Scripta Tria emendatora (1848); Populare Ausfue r zu dem Allerum (1856, and much enlarged ed., 1873), his best work in this line; the Herodotus, a critical edition of the Greek text; and in the last five years, his Hesiod, an edition which he carefully scrutinized. His last work, Opuscula (1873), was a collection of miscellaneous papers. He published also a number of critical papers and bibliographical works. In ancient mythology, to Homer and Euripides, he was the greatest master of the odes as spasmodic, and in the metrical forms of his poem.

See the exhaustive article by L. Friedländer in Allgemeine Deutsche Biographie, xvi.; E. Cammer in C. Buriana's Jahresbericht (1879); A. Jung, Zur Erinnerung an Karl Lehres (progr. Meseritz, 1880); A. Ludwich edited Lehres' select correspondence (1894) and his kleine Schriften (1902).
LEIBNITZ

LEIBNITZ (LEIBNITZ), GOTTFRIED WILHELM (1646–1716), German philosopher, mathematician and man of affairs, was born on the 1st of July 1646 at Leipzig, where his father was professor of moral philosophy. Though the name Leibniz, Leibnitz or Lubejicz was originally Slavonic, his ancestors were German, and for three generations had been in the employment of the Saxon government. Young Leibniz was sent to the Nicolai school at Leipzig, but, from 1652 when his father died, seems to have been for the most part his own teacher. From his father he had acquired a love of historical study. The German books at his command were soon read through, and with the help of two Latin books—the Thesaurus Chronologicus of Calvisius and an illustrated edition of Livy—he learned Latin at the age of eight. His father’s library was now thrown open to him, to his great joy, with the permission, Tolle, legi. Before he was twelve he could read Latin easily and had begun Greek; he had also remarkable facility in writing Latin verse. He next turned to the study of logic, attempting already to reformulate its doctrines, and zealously reading the scholastics and some of the Protestant theologians.

At the age of fifteen, he entered the university of Leipzig as a law student. His first two years were devoted to philosophy under Jakob Thomasius, a Neo-Aristotelian, who is looked upon as having founded the scientific study of the history of philosophy in Germany. It was at this time probably that he first made acquaintance with the modern thinkers who had already revolutionized science and philosophy, Francis Bacon, Cardan and Campanella, Kepler, Galileo and Descartes; and he began to consider the difference between the old and new ways of regarding nature. He resolved to study mathematics. It was not, however, till the summer of 1663, which he spent at Jena under E. Weigel, that he obtained the instructions of a mathematician of repute; nor was the deeper study of mathematics entered upon till his visit to Paris and acquaintance with Huygens many years later.

The next three years he devoted to legal studies, and in 1666 applied for the degree of doctor of law, with a view to obtaining the post of assessor. Being refused on the ground of his youth he left his native town for ever. The doctor’s degree refused him there was at once (November 5, 1666) conferred on him at Altdorf—the university town of the free city of Nuremberg—where his brilliant dissertation procured him the immediate offer of a professor’s chair. This, however, he declined, having, as he said, ‘very different things in view.’

Leibnitz, not yet twenty-one years of age, was already the author of several remarkable essays. In his bachelor’s dissertation De principiis individii (1663), he defended the nominalistic doctrine that individuality is constituted by the whole entity or essence of a thing; his arithmetical tract De compositionibus, published in an extended form under the title De arte combinatoria (1666), is an essay towards his life-long project of a reformulated symbolism and method of thought; and besides these there are our juridical essays, including the Nova methodus docendi discernendi juris, written in the intervals of his journey from Leipzig to Altdorf. This last essay is remarkable, not only for the reconstruction it attempted of the Corpus juris, but as containing the first clear recognition of the importance of the historical method in law. Nuremberg was a centre of the Rosicrucians, and Leibnitz, busying himself with writings of the alchemists, soon gained such a knowledge of their tenets that he was supposed to be one of the secret brotherhood, and was even elected their secretary. A more important result of his visit to Nuremberg was his acquaintance with Johann Christian von Boyneburg (1622–1672), formerly first minister to the elector of Mainz, and one of the most distinguished German statesmen of the day. By his advice Leibnitz printed his Nova methodus in 1667, dedicated it to the elector, and, going himself presented it to him in person. It was thus that Leibnitz entered the service of the elector of Mainz, at first as an assistant in the revision of the statute-book, afterwards on more important work.

The policy of the elector, which the pen of Leibnitz was now called upon to promote, was to maintain the security of the German empire, threatened on the west by the aggressive power of France, on the east by Turkey and Russia. Thus when in 1669 the crown of Poland became vacant, it fell to Leibnitz to support the claims of the German candidate, which he did in his first political writing, Specimen demonstrationum politicorum pro rege Polonorum eligendo, attempting, under the guise of a Catholic Polish nobleman, to show by mathematical demonstration that it was necessary in the interest of Poland that it should have the count palatine of Neuburg as its king. But neither the diplomatic skill of Boyneburg, who had been sent as plenipotentiary to the election at Warsaw, nor the arguments of Leibnitz were successful, and a Polish prince was elected to fill the vacant throne.

A greater danger threatened Germany in the aggressions of Louis XIV. (see France: History). Though Holland was in immediate danger, the seizure of Lorraine in 1670 showed that Germany too was threatened. It was in this year that Leibnitz wrote his Theses on Public Safety, in which he urged the formation of a new ‘Rheinbund’ for the protection of Germany, and contended that the states of Europe should employ their power, not against one another, but in the conquest of the non-Christian world, in which Egypt, “one of the best situated lands in the world,” would fall to France. The plan thus proposed of averting the threatened attack on Germany by a French expedition to Egypt was discussed with Boyneburg, and obtained the approval of the elector. French relations with Turkey were at the time so strained as to make a breach imminent, and at the close of 1671, about the time when the war with Holland broke out, Louis himself was approached by a letter from Boyneburg and a short memorial from the pen of Leibnitz, who attempted to show that Holland itself, as a mercantile power trading with the East, might be best attacked through Egypt, while nothing would be easier for France or would more largely increase her power than the conquest of Egypt. On February 12, 1672, a request came from the French secretary of state, Simon Arnauld de Pompeonne (1618–1699), that Leibnitz should go to Paris. Louis seems still to have kept the matter in view, but never granted Leibnitz the personal interview he desired, while Pompeonne wrote, “I have nothing against the plan of a holy war, but such plans, you know, since the days of St Louis, have ceased to be the fashion.” Not yet discouraged, Leibnitz wrote a full account of his project for the king, and a summary of the same evidently intended for Boyneburg. But Boyneburg died in December 1672, before the latter could be sent to him. Nor did the former ever reach its destination. The French quarrel with the Porte was made up, and the plan of a French expedition to Egypt disappeared from practical politics till the time of Napoleon. The history of this scheme, and the reason of Leibnitz’s journey to Paris, long remained hidden in the archives of the Hanoverian library. It was on his taking possession of Hanover in 1863 that he urged Leibnitz, through his Consilium Aegypticum, that the idea of a French conquest of Egypt had been first put forward by a German philosopher. In the same year there was published in London an account of the Justum dissertatio4 of which the British Government had procured a copy in 1799. But it was only with the appearance of the edition of Leibnitz’s works begun by Onno Klopp in 1864 that the full history of the scheme was made known.

Leibnitz had other than political ends in view in his visit to France. It was as the centre of literature and science that Paris chiefly attracted him. Political duties never made him lose sight of his philosophical and scientific interests. At Mainz he was still busied with the question of the relation between the old and new methods in philosophy. In a letter to Jakob

4 A Summary Account of Leibnitz’s Memoir addressed to Lewis the Fortieth, &c. [edited by Granville Penn], (London, 1803).
Thomasius (1660) contends that the mechanical explanation of nature by magnitude, figure and motion alone is not inconsistent with the doctrines of Aristotle’s *Physica*, in which he finds more truth than in the *Mediations* of Descartes. Yet these qualities of bodies, he argues in 1668 (in an essay published without his knowledge under the title Confessio naturae contra atheistas), require an incorporeal principle, or God, for their ultimate explanation. He also wrote at this time a defence of the doctrine of the Trinity against Wissowatus (1660), and an essay on philosophic style, introductory to an edition of the *Antiquus barbatus* of Nizolius (1670). Clearness and distinctness alone, he says, are what makes a philosophic style, and no language is better suited for this popular exposition than the German.

In 1671 he issued a *Hypothesis physica nova*, in which, agreeing with Descartes that corporeal phenomena should be explained by motions and collisions from without, he attacked the mechanical explanation of nature. By contending that the original of this motion is a fine aether, similar to light, or rather constituting it, which, penetrating all bodies in the direction of the earth’s axis, produces the phenomena of gravity, elasticity, &c. The first part of the essay, on concrete motion, was dedicated to the Royal Society of London, the second, on abstract motion, to the French Academy.

At Paris Leibnitz met with Arnauld, Malebranche and, more important still, with Christian Huygens. This was pre-eminent the period of his mathematical and physical activity. Before leaving Mainz he was able to announce 1 an imposing list of discoveries, and plans for discoveries, arrived at by means of his new logical art, in natural philosophy, mathematics, mechanics, optics, hydrostatics, pneumatics and nautical science, not to speak of new ideas in law, theology and politics. Chief among these discoveries was that of a calculating machine for performing more complicated operations than that of Pascal—multiplying, dividing and extracting roots, as well as adding and subtracting. This machine was exhibited to the Academy of Paris and to the Royal Society of London, and Leibnitz was elected a fellow of the latter society in April 1673. In January of this year he had gone to London as an attaché on a political mission from the elector of Mainz, returning in March to Paris, and while in London he had become personally acquainted with Oldenburg, the secretary of the Royal Society, with whom he had already corresponded, with Boyle the chemist and Pell the mathematician. It is from this period that we must date the impulse that directed him anew to mathematics. By Pell he had been referred to Mercator’s *Logarithmotechnia* as already containing some numerical observations that could be reduced to the form of an original for performing the operations; and, on his return to Paris, he devoted himself to the study of higher geometry under Huygens, entering almost at once upon the series of investigations which culminated in his discovery of the differential and integral calculus (see INTEGRAL CALCULUS).

Shortly after his return to Paris in 1673, Leibnitz ceased to be in the Mainz service any more than in name, but in the same year entered the employment of Duke John Frederick of Brunswick-Lüneburg, with whom he had corresponded for some time. In 1676 he removed at the duke’s request to Hanover, travelling thither by way of London and Amsterdam. At Amsterdam he saw and conversed with Spinoza, and carried away with him extracts from the latter’s unpublished *Ethica*.

For the next forty years, and under three successive princes, Leibnitz was in the service of the Brunswick family, and his headquarters were at Hanover, where he had charge of the ducal library. Leibnitz thus passed into a political atmosphere formed by the dynamic aims of the typical German state (see HANOVER; BRUNSWICK). He supported the claim of Hanover to appoint an ambassador at the congress of Nimeguen (1676) to defend the establishment of primogeniture in the Lüneburg branch of the Brunswick family; and, when the proposal was

1. In a letter to the duke of Brunswick-Lüneburg (autumn 1671).
3. Casaurini *Pariseri, tractatus de jure supremacæ a episcopis principum Germaniae* (Amsterdam, 1677); *Entretiens de Philèrête et d’Engin sur le droit d’ambassade* (Duisb., 1677).

made to raise the duke of Hanover to the electorate, he had to show that this did not interfere with the rights of the duke of Württemberg. In 1692 the duke of Hanover was made elector. Before, and with a view to this, Leibnitz had been employed by him to write the history of the Brunswick-Lüneburg family, and, to collect material for his history, had undertaken a journey through Germany and Italy in 1687—1690, visiting and examining the records in Marburg, Frankfurt-on-the-Main, Munich, Vienna (where he remained nine months), Venice, Modena and Rome. At Rome he was offered the custodianship of the Vatican library on condition of his joining the Catholic Church.

About this time, too, his thoughts and energies were partly taken up with the scheme for the reunion of the Catholic and Protestant Churches. At Mainz he had joined in an attempt made to reconcile the differences between the two Churches by a concordat, and now, chiefly through the energy and skill of the Catholic Royas de Spinola, and from the spirit of moderation which prevailed among the theologians he met with at Hanover in 1683, it almost seemed as if some agreement might be arrived at. In 1686 Leibnitz wrote his *Systema theologiam*, in which he strove to find common ground for Protestants and Catholics in the details of their creeds. But the English revolution of 1688 interfered with the scheme in Hanover, and it was soon found that the religious difficulties were greater than had at one time appeared. In the letters to Leibnitz from Bossuet, the landgrave of Hessen-Rheinfels, and Madame de Brinon, the aim is obviously to make converts to Catholicism, not to arrive at a compromise with Protestantism, and when it was found that Leibnitz refused to be converted the correspondence ceased.

A further scheme of church union in which Leibnitz was engaged, that between the Reformed and Lutheran Churches, met with no better success.

Returning from Italy in 1690, Leibnitz was appointed librarian at Wolfenbüttel by Duke Anton of Brunswick-Wolfenbüttel. Some years afterwards began his connexion with Berlin through his friendship with the electress Sophie Charlotte of Brandenburg and her mother the princess Sophie of Hanover. He was invited to Berlin in 1700, and on the 11th July of that year the academy (Akademie der Wissenschaften) he had planned was founded, with himself as its president for life. In the same year he was made a privy councillor of justice by the elector of Brandenburg. Four years before he had received a like honour from the elector of Hanover, and twelve years afterwards the same distinction was conferred upon him by Peter the Great, to whom he gave a plan for an academy at St Petersburg, carried out after the czar’s death. After the death of his royal pupil in 1705 his visits to Berlin became less frequent and less welcome, and in 1711 he was there for the last time. In the following year he undertook his fifth and last journey to Vienna, where he stayed till 1714.

An attempt to found an academy of science there was defeated by the opposition of the Jesuits, but he now attained the honour he had coveted of an imperial privy councilship (1712), and, either at this time or on a previous occasion (1750), was made a baron of the empire (Reichsfreiherr). Leibnitz returned to Hanover in September 1714, but found the elector George Louis had already gone to assume the crown of England. Leibnitz would gladly have followed him to London, but was bidden to remain at Hanover and finish his history of Brunswick.

During the last thirty years Leibnitz had been busy with many matters. Mathematics, natural science, philosophy, theology, history jurisprudence, politics (particularly the French wars with Germany, and the question of the Spanish succession), economics and philology, all gained a share of his attention; almost all of them he enriched with original observations.

His genealogical researches in Italy—through which he established the common origin of the families of Brunswick and

1. Not published till 1819. It is on this work that the assertion has been founded that Leibnitz was at heart a Catholic—a supposition clearly disproved by his correspondence with Brinon.
2. In his *Protagoras* (1691) he developed the notion of the historical genesis of the present condition of the earth’s surface. Cf. O. Poschel, Gesch. d. Erdkunde (Münch., 1866), pp. 615 sq.
Este—were not only preceded by an immense collection of historical sources, but enabled him to publish materials for a code of international law. The history of Brunswick itself was the last work of his life, and had covered the period from 768 to 1005 when death ended his labours. But the government, in whose service and at whose order the work had been carried out, left it in the archives of the Hanover library till it was published by Pertz in 1843.

It was in the years between 1690 and 1716 that Leibnitz’s chief philosophical works were composed, and during the first ten of these years the accounts of his system were, for the most part, preliminary sketches. Indeed, he never gave a full and systematic account of his doctrines. His views have to be gathered from his letters to friends, from occasional articles in the Acta Eruditorum, the Journal des Savants, and other journals, and from one or two more extensive works. It is evident, however, that philosophy had not been entirely neglected in the years in which his pen was almost solely occupied with other matters. A letter to the duke of Brunswick, and another to Arnauld, in 1671, show that he had already reached his new notion of substance; but it is in the correspondence with Antoine Arnauld, between 1686 and 1690, that his fundamental ideas and the reasons for them are for the first time made clear. The appearance of Locke’s Essay in 1660 had not lessened his impression than the works of the philosophers of the French Academy, and his perception of its activity that the separate existence of the individual becomes evident; for his system individuality is as fundamental as activity. The monads, he says, are the very atoms of nature and mind, the elementary portion of the universe, and have neither parts, extension nor figure (p. 705). Hence their distinction from the atoms of Democritus and the materialists. They are metaphysical points or rather spiritual beings whose very nature is so the monads naturally pass and are always passing into action without any aid but the absence of opposition (p. 122). Nor do they, like the atoms, act upon one another (p. 680); the action of each exerts itself as the action of a cosmic body in the universe as a whole state, the determinator of its own future (pp. 706, 722).

The monads have no windows by which anything may go in or out (p. 705).

Further, since all substances are of the nature of force, it follows that—"in imitation of the notion which we have of souls"—they must contain something analogous to feeling and appetite. It is the nature of the monad to represent the many in one, and this is perception, by which external events are mirrored internally (p. 438). Through their own activity the monads mirror the universe (p. 725), but each in its own way and from its own point of view, with a more or less perfect perception (p. 127); for the Cartesians had not been more than nominalists, and, as monads, they identify it with the reflex cognizance of it which may be called apprehension. Every monad is thus a microcosm, the universe in little, and according to the degree of its activity is the distinctness of its representation of the universe as a whole. Following the Aristotelian term, calls the monads entelechies, because they have a certain perfection (ἐν τελείως) and sufficiency (ἀνάλυσις) which make them sources of their internal actions and, so to speak, incorporal automata (p. 706). That the monad is not pure entelechy is shown by the discriminations above stated. Excluding all external limitation, they are yet limited by their own nature. All created monads contain a passive element or materia prima (pp. 449, 687, 725), in virtue of which their perceptions are more or less imperfect. This imperfection, this is inhibited by the passive principle, so that there arises in the monad an appetite or tendency to overcome the inhibition and become more perfect, and which follows the change from one perception to another. This activity of the monad is not activity of passivity in it one monad is differentiated from another. The greater the amount of activity or of distinct perceptions the more perfect is the monad; the stronger the element of passivity, the more diversified is the perception. If the soul was a divinity it had it nothing but distinct perceptions (p. 520).

The monad is never without a perception; but, when it has a number of little perceptions, the separation of them by the same, similar to that of being stunned ensues, the monads being perturnly in this state (p. 707). Between this and the most distinct perception there is room for an infinite diversity of nature among the monads, which, however, are not perceived as distinct, as one another; for, were it possible that there should be twodimensional, there would be no sufficient reason why God, who brings them into existence, should not have made them differently. It is evident, therefore, that this is a distinction, a state of things, which is not to be described as a true perception, or as an infinite diversity of nature among the monads, which, however, are not perceived as distinct, as one another; for, were it possible that there should be twodimensional, there would be no sufficient reason why God, who brings them into existence, should not have made them differently.
actual existence, should put one of them at one definite time and place, the other at a different time and place. This is Leibnitz’s principle of the identity of indiscernibles (pp. 277, 755); by his early problem as to the principle of individuation is solved by the distinction he introduces between the individuating condition of an individual mark sui generis. The principle thus established is formulated in Leibnitz’s law of contingency, founded, he says, on the doctrine of the mathematical infinite, essential to geometry, and of the mathematical infinitesimal, which is the basis of calculus; there is neither vacuum nor break in nature, but “everything takes place by degrees” (p. 392), the different species of creatures rising by insensible steps from the lowest to the most perfect form (p. 395).

As in every monad each succeeding state is the consequence of the preceding, and as it is of the nature of every monad to mirror or represent the universe, it follows (p. 774) that the perceptive content of every monad can be perceived by any other monad. This is another aspect of the identity of indiscernibles, the identity of substance taken as the identity of substance taken as the whole universe.

From this harmony of self-determining perceptive units Leibnitz has to explain the world of nature and mind. As everything that really exists is of the nature of spiritual or metaphysical points (p. 774), his monads are not only relational and relational only have a phenomenal existence (p. 745), being dependent not on the nature of the monads themselves but on the way in which they are perceived. Considering that several things exist at the same time in a certain area of order, and the identity of substance is established, there is an identity relation for something that exists outside of them, the mind forms the confused perception of space (p. 768). But space and time are merely relative, the former as a consistent duality or as something both and any more than there are individual material units or atoms from which all things are built up (pp. 126, 186, 277).

From the body, corporeal mass, or, as Leibnitz calls it, to distinguish it from the material seconda (the material seconda, is thus only a “phantom bene fundatun” (p. 436). It is not a substantia but substantiae or substantiatum (p. 745). While this, however, is the only view consistent with Leibnitz’s fundamental monadism, Leibnitz himself, as a monadist, is also the subject of Leibnitz’s principle of mutual influence, the second the method of the occasionalists, the third that of pre-established harmony (p. 714)—we have the same result as if one influenced the other. This is further explained by Leibnitz in his well-known illustration of the different ways in which two clocks may keep exactly the same time, the one as a whole, the other; or, whenever one moves the mechanism may make a similar alteration in the other, or they may have been so perfectly constructed at first as to continue to correspond at every instant without mutual influence (pp. 108, 133). The first way represents the common (Locke’s) theory of mutual influence, the second the mechanism of the occasionalists, the third that of pre-established harmony. Thus the body does not act on the soul in the production of the whole realm of final causes and that of efficient causes of a kind of cognition. Not a certain select class of our ideas only (as Descartes held), but all our ideas, are innate, though only worked up into actual cognition in the development of knowledge (p. 212).

Leibnitz, however, has another reason why he says, “nisi intellectus ipse” (p. 223). The soul at birth is not comparable to a tabula rasa, but rather to an unworked block of marble, the hidden laws of whose determination are already formed. He is thus forced to recognize that the opposite assumption is impossible, and with his cardinal metaphysical view of the monads as the only real entities.

From Leibnitz’s doctrine of force as the ultimate reality it follows that what we see must be for him a mere effect, not an effect, by his project of a dynamic, or theory of natural philosophy, was never carried out, the outlines of his own theory and his criticism of the mechanical physics of Descartes are known to us. The whole distinction between the dynamical and the mathematical views of nature. Descartes started from the reality of extension as constituting the nature of material substance, and found in magnitude, figure and motion the explanation of the material first principles. Leibnitz, on the contrary, rejected the notion of nature as giving the laws of corporeal phenomena (p. 439), applying also to everything that takes place in animal organisms, even the human body (p. 777). But, as phenomenal, these laws must find their explanation in the ultimate first principles of the physical order, and hence, this is an essential distinction between the views of the two great philosophers. All things, he says (in his Specimen Dynamicum), can be explained either by efficient or by final causes. But the latter method is not appropriate to individual occurrences, though it must be applied when the efficient cause is the immediate one in the sequence of events (p. 108). For Descartes’s doctrine of the constancy of the quantity of motion (i.e. momentum) in the world Leibnitz substitutes the principle of the conservation of vis viva, and contends that the Cartesian position that motion is measured by velocity should be superseded by the law that moving force (vis motus) is measured by the square of velocity. This difference is, according to Leibnitz, the characteristic but false which contains a contradiction, and that true which is contradictory to the false. The latter rests on the principle of sufficient reason or of reality (compossibilitas), according to which no more than what is true is necessary, and this principle has also to be satisfied, and not otherwise (agreeing thus with the principium melioris or final cause). Leibnitz, the purely active monad, has an a priori acquaintance of the principle of sufficient reason; they have their sources in the way in which we think for ourselves; i.e. Leibnitz, in his passivity, whereas the truths of reason have their source in our mind in itself or in its activity.

1 The difference between an organic and an inorganic body consists, he says, in this, that the former is a machine even in its smallest parts.

Both kinds of truths fall into two classes, primitive and derivative. The primitive truths of fact are, as Descartes held, those of internal experience, and the derivative truths are inferred from them in accordance with the principle of sufficient reason, by their agreement in accordance with the principle of the whole. They are thus reached by probable arguments—a department of logic which Leibnitz was the first to bring into prominence (pp. 84, 164, 168, 169, 345). The primitive truths of reasoning are identical (in later terminology, analytically) with the axioms of the symbolic calculus. They are the main idea of Leibnitz’s “universal characteristic,” never fully worked out by him, which he regarded as one of the greatest discoveries of the age. An incidental result of its adoption would be the introduction of the universal symbol or thought comparable to the symbolism of mathematics and intelligible in all languages (c.f. p. 356). But the great revolution it would effect would chiefly consist in this, that truth and falsehood would be no longer matters of opinion but of certainty or error according to the character or symbol,1 composite notions denoted by the formulas formed by the union of several definite characters, and judgments by the relation of equiimplication among these formulas, so that no one can break down the system, the result of which is the highest degree of Leibnitz’s “universal characteristic,” never fully worked out by him, which he regarded as one of the greatest discoveries of the age.

The positive properties or perfections of the monads, Leibnitz has insisted on a centenary, i.e., without the minor that characterizes the created monads (p. 276), in God—their perception as His wisdom or intellect, and their attribute as His absolute will or goodness (p. 654); while the absence of all limit is the divine independence or freedom, by which is meant the power, which in God is conditioned by His intellect, their reality on His will (p. 596).

The universe in its harmonious order is thus the realization of the divine end, and as such must be the best possible (p. 305). The teleology of Leibnitz becomes the history of the world, the mission to manifest and communicat His perfection (pp. 524), and, in choosing this world out of the infinite number that exist in the region of ideas (p. 515), was guided by the principium melioris (p. 506).

The world, then, is the actual world, the real world, the world of finite facts, the world of the existence of evil in the best of all possible worlds. With this end in view he distinguishes (p. 655) between (1) metaphysical evil or imperfection, which is unconditionally willed by God as essential to the finite physical world; (2) moral evil, which is conditionally willed by God as punishment or as means to greater good (cf. p. 510); and (3) moral evil, in which the great difficulty lies, and which Leibnitz makes various attempts to explain. He says that it was merely permitted not willed by God (p. 655), and, that the good will more than compensate for the evil, because it was foreseen that the world with evil would nevertheless be better than any other possible world (p. 350). He also speaks of the evil as a mere set-off to the good in the world, which it increases by actual existence.

The great problem of Leibnitz’s Théodicée thus remains unsolved. The suggestion that evil consists in a mere imperfection, like that of the monads proceeding from God by a continual emanation, was so far from being acceptable to modern philosophers as to aim to be carried out by him. Had he done so his theory would have transcended the independence of the monads with which it started, and found a deeper unity in the universe than that resulting from the somewhat arbitrary assertion that the monads reflect the universe.

The philosophy of Leibnitz in the more systematic and abstract form it received at the hands of Wolf, ruled the schools of Germany nearly a century, i.e., without the minor that characterizes the critical philosophy by which it was superseded. On it Baumgarten laid the foundations of a science of aesthetic. Its treatment of theological questions heralded the German Aufklärung. And on many special points—in its psychological theory of the conception of forms, and the definition of the nature of uncanny perception, its attempt at a logical symbolism—it has suggested ideas fruitful for the progress of science.

BIBLIOGRAPHY.—(1) Ed. to 1900 no attempt had been made to publish the complete works. Several editions existed, but a vast mass of MSS. (letters, &c.) remained only roughly classified in the Hanover library. The chief editions were: (1) L. Dutens (Geneva, 1678), called Opera Omnia, but far from complete; (2) G. K. Pertz, ed. Grégoire, Dedest. Staatsrechts politec. (2 vols., 1807-1865); (3) H. K. L. le Pertz, ed. F. Poupart, 2nd ed. (3 vols., 1868-1877); (4) J. Vellet, ed. Pertz, 2nd ser. vol. i. p. 167.

LEICESTER, EARLS OF

Robert de Beaumont (d. 1118) is frequently but erroneously considered to have received the earldom from Henry I., about 1107; he had, however, some authority in the county of Leicester and his son Robert was undoubtedly earl of Leicester in 1131.

The 3rd Beaumont earl, another Robert, was also steward of England, a dignity which was attached to the earldom of Leicester from this time until 1390. The earldom reverted to the crown when Robert de Beaumont, the 4th earl, died in January 1204.

In 1205 Simon IV., count of Montfort (g.v.), nephew and heir of Earl Robert, was confirmed in the possession of the earldom by King John, but it was forfeited when his son, the famous Simon de Montfort, was attainted and was killed at Evesham in August 1265. Henry III.'s son Edmund, earl of Lancaster, was also earl of Leicester and steward of England, obtaining these offices a few months after Earl Simon's death.

Edmund's sons, Thomas and Henry, both earls of Lancaster, and his grandson Henry, duke of Lancaster, in turn held the earldom, which then passed to a son-in-law of Duke Henry, William V., count of Holland (c. 1397-1386), and then to another and more celebrated William, son of Gaunt, duke of Lancaster. When in 1399 Gaunt's son became king as Henry IV., the earldom was merged in the crown.

In 1564 Queen Elizabeth created her favourite, Lord Robert Dudley, earl of Leicester. The new earl was a son of John Dudley, duke of Northumberland; he left no children, or rather none of undoubted legitimacy, and when he died in September 1588 the title became extinct.

In 1618 the earldom of Leicester was revived in favour of Robert Sidney, Viscount Lisle, a nephew of the late earl and a brother of Sir Philip Sidney; it remained in this family until the death of Jocelyn (1682-1745), the 7th earl of this line, in July 1743. Jocelyn left no legitimate children, but a certain John Sidney claimed to be his son and consequently to be 8th earl of Leicester.

In 1744, the year after Jocelyn's death, Thomas Coke, Baron Lovel (c. 1693-1759), was made earl of Leicester, but the title became extinct on his death in April 1759. The next family to hold the earldom was that of Townshend, George Townshend (1755-1811) being created earl of Leicester in 1784. In 1807 George succeeded his father as 2nd marquess Townshend, and when his son George Ferrars Townshend, the 3rd marquess (1778-1855), died in December 1855 the earldom again became extinct.

Before this date, however, another earldom of Leicester was in existence. This was created in 1837 in favour of Thomas William Coke, who had inherited the estates of his relative Thomas Coke, earl of Leicester. To distinguish his earldom from that held by the Townshends Coke was ennobled as earl of Leicester of Holkham; his son Thomas William Coke (1822-1900) became 2nd earl of Leicester in 1842, and the latter's son Thomas William (b. 1848) became 3rd earl.

LEICESTER, ROBERT DUDLEY, EARL OF (c. 1531-1558). This favourite of Queen Elizabeth came of an ambitious family. They were not, indeed, such mere upstarts as their enemies loved to represent them; for Leicester's grandfather—the notorious Edmund Dudley who was one of the chief instruments of Henry VII.'s extortions—was descended from a younger branch of the barons de Dudley; and his name seems to have increased in them with each succeeding generation, and though the grandfather was beheaded by Henry VIII. for his too devoted services in the preceding reign, the father grew powerful enough in the days of Edward VI. to trouble the succession to the crown. This was that John Dudley, duke of Northumberland, who contrived the marriage of Lady Jane Grey with his own son Guildford Dudley, and involved both her and her husband in a common ruin with himself.

Robert Dudley, the subject of this article, was an elder brother of Guildford, and shared at that time in the misfortunes of the whole family. Having taken up arms with them against Queen Mary, he was sent to the Tower, and was sentenced to death; but the queen not only pardoned and restored him to
liberty, but appointed him master of the ordnance. On the accession of Elizabeth he was also made master of the horse. He was then, perhaps, about seventy-two, and was evidently rising rapidly in the queen's favour. At an early age he had been married to Amy, daughter of Sir John Roehsart. The match had been arranged by his father, who was very studious to provide in this way for the future fortunes of his children, and the wedding was graced by the presence of King Edward. But if it was not a love match, there seems to have been no positive estrangement between the couple. Amy visited her husband in the Tower during his imprisonment; but afterwards when, under the new queen, he was much at court, she lived a good deal apart from him. He visited her, however, at times, in different parts of the country, and his expenses show that he treated her liberally. In September 1560 she was staying at Cumnor Hall in Berkshire, the house of one Anthony Forster, when she met her death under circumstances which certainly aroused suspicions of foul play. It is quite clear that her death had been surmised some time before as a thing that would remove an obstacle to Dudley's marriage with the queen, with whom he stood in so high favour. We may take it, perhaps, from Venetian sources, that she was then in delicate health, while Spanish state papers show further that there were scandalous rumours of a design to poison her; which were all the more propagated by malice after the event. The occurrence, however, was explained as owing to a fall down stairs in which she broke her neck; and the explanation seems perfectly adequate to account for all we know about it. Certain it is that Dudley continued to rise in the queen's favour. She made him a Knight of the Garter, and bestowed on him the castle of Kenilworth, the lordship of Denbigh and other lands of very great value in Warwickshire and in Wales. In September 1564 she created him baron of Denbigh, and immediately afterwards earl of Leicester. In the preceding month, when she visited Cambridge, she at his request addressed the university in Latin. The honours shown him excited jealousy, especially as it was well known that he entertained still more ambitious hopes, which the queen apparently did not altogether discourage. The Earl of Sussex, in opposition to him, strongly favoured a match with the archduke Charles of Austria. The court was divided, and, while arguments were set forth on the one side against the queen's marrying a subject, the other party insisted strongly on the disadvantages of a foreign alliance. The queen, however, was so far from being foolishly in love with him that in 1564 she recommended him as a husband for Mary Queen of Scots. But this, it was believed, was only a blind, and it may be doubted how far the proposal was serious. After his creation as earl of Leicester great attention was paid to him both at home and abroad. The university of Oxford made him their chancellor, and Charles IX. of France sent him the order of St. Michael. A few years later he formed an ambiguous connexion with the baroness dowager of Sheffield, which was maintained by the lady, if not with truth at least with great plausibility, to have been a valid marriage, though it was concealed from the queen. Her own subsequent conduct, however, went far to discredit her statements; for she married again during Leicester's life, when, according to her own words, the court was in the days of James I., her son, Sir Robert Dudley, a man of extraordinary talents, sought to establish his legitimacy; but his suit was suddenly brought to a stop, the witnesses discredited and the documents connected with it sealed up by an order of the Star Chamber.

In 1575 Queen Elizabeth visited the earl at Kenilworth, where she was entertained for some days with great magnificence. The picturesque account of the event given by Sir Walter Scott has made every one familiar with the general character of the scene. Next year Walter, earl of Essex, died in Ireland, and Leicester's subsequent marriage with his widow again gave rise to very serious imputations against him. For report said that he had had two children by her during her husband's absence in Ireland, and, as the feud between the two ears was notorious, Leicester's many enemies easily suggested that he had poisoned his rival. This marriage, at all events, tended to Leicester's discredit and was kept secret at first; but it was revealed to the queen in 1579 by Sinner, an emissary of the duke of Alençon, to whose projected match with Elizabeth the earl seemed to be the principal obstacle. The queen showed great displeasure at the news, and had some thought, it is said, of committing Leicester to the Tower, but was dissuaded from doing so by his rival the earl of Sussex. He had not, indeed, favoured the Alençon marriage, but otherwise he had sought to promote a league with France against Spain. He and Burleigh had listened to proposals from France for the conquest and division of Flanders, and they were in the secret about the capture of Brill. When Alençon actually arrived, indeed, in August 1579, Dudley being in disgrace, showed himself for a time anti-French; but he soon returned to his former policy. He encouraged Drake's piratical expeditions against the Spaniards and had a share in the booty brought home. In February 1582 he, with a number of other noblemen and gentlemen, escorted the duke of Alençon on his return to Antwerp to be invested with the government of the Low Countries. In 1583 he inaugurated an association for the protection of Queen Elizabeth against conspirators. About the time there issued from the press the famous pamphlet, supposed to have been written by the poet of Parsons the Jesuit, entitled Leicester's Commonwealth, which was intended to suggest that the English constitution was subverted and the government handed over to one who was at heart an atheist and a traitor, besides being a man of infamous life and morals. The book was ordered to be suppressed by letters from the privy council, in which it was declared that the charges against the earl were to the queen's certain knowledge untrue; nevertheless they produced a very strong impression, and were believed in by some who had no sympathy with Jesuits long after Leicester's death. In 1585 he was appointed commander of an expedition to the Low Countries in aid of the revolted provinces, and sailed with a fleet of fifty ships to Flushing, where he was received with great enthusiasm. In January following he was invested with the government of the provinces, but immediately received a strong reprimand from the queen for taking upon himself a function which she had not authorized. Both he and the states general were obliged to apologize; but the latter protested that they had no intention of giving him absolute control of their affairs, and that it would be extremely dangerous to them to revoke the appointment. Leicester accordingly was allowed to retain his dignity; but the incident was inauspicious, nor did affairs prosper greatly under his management. The most brilliant achievement of the war was the action at Zutphen, in which his nephew Sir Philip Sidney was slain. But complaints were made by the states general of the conduct of the whole campaign. He returned to England for a time, and went back in 1587, when he made an abortive effort to raise the siege of Sluys. Disagreements increasing between him and the states, he was recalled by the queen, from whom he met with a very good reception; and he continued in such favour that in the following summer (the year being that of the Armada, 1588) he was appointed lieutenant-general of the army mustered at Tilbury to resist Spanish invasion. After the crisis was past he was returning home himself from the court to Kenilworth, when he was attacked by a sudden illness and died at his house at Cornbury in Oxfordshire, on the 4th September.

Such are the main facts of Leicester's life. Of his character it is more difficult to speak with confidence, but some features of it are indisputable. Being in person tall and remarkably handsome, he improved these advantages by a very ingratiating manner. A man of no small ability and still more ambition, he was nevertheless vain, and presumed at times upon his influence with the queen to a degree that brought upon him a sharp rebuff. Yet Elizabeth stood by him. That she was ever really in love with him, as modern writers have supposed, is extremely questionable; but she saw in him some valuable qualities which marked him as the fitting recipient of high favours. He was a man of princely tastes, especially in architecture. At court he became latterly the leader of the Puritan party.
and his letters were pervaded by expressions of religious feeling which it is hard to believe were insincere. Of the darker suspicions against him it is enough to say that much was certainly enough to support both the truth; but there remain some facts sufficiently disagreeable, and others, perhaps, sufficiently mysterious, to make a just estimate of the man a rather perplexing problem.

No special biography of Leicester has yet been written except in biographical dictionaries and encyclopaedias. A general account of him will be found in the Memoirs of the Sidney prefixed to Cooke's Letters and Memorials of State; but the fullest account is given in the full text (in English) of De Quadra's letter of Sept. 11, 1650, on which so much has been built.

LEICESTER, ROBERT SIDNEY, EARL OF (1563–1626), second son of Sir Henry Sidney (q.v.), was born on the 10th of November 1563, and was educated at Christ Church, Oxford, afterwards travelling on the Continent for some years between 1578 and 1583. In 1585 he was elected member of parliament for Glamorganshire; and in the same year he went with his elder brother Sir Philip Sidney (q.v.) to the Netherlands, where he served in the war against Spain under his uncle Robert Dudley, earl of Leicester. He was present at the engagement where Sir Philip Sidney was mortally wounded, and remained with his brother till the latter's death in October 1586. After visiting Scotland on a diplomatic mission in 1588, and France on a similar errand in 1593, he returned to the Netherlands in 1596, where he rendered distinguished service in the war for the next two years. He had been appointed governor of Flushing in 1588, and he spent much time there till 1603, when, on the accession of James I., he returned to England. James raised him at once to the peerage as Baron Sidney of Penshurst, and he was appointed chamberlain to the queen consort. In 1603 he was created Viscount Lisle, and in 1618 earl of Leicester, the latter title having become extinct in 1588 on the death of his uncle, whose property he had inherited (see LEICESTER, EARLS OF). Leicester was a man of taste and a patron of literature, whose cultured mode of life at his country seat, Penshurst, was celebrated in verse by Ben Jonson. The earl died at Penshurst on the 13th of July 1626. He was twice married; first to Barbara, daughter of John Gamage, a Glamorganshire gentleman; and secondly to Sarah, daughter of William Blount, and widow of Sir Thomas Smythe. By his first wife he had a large family. His eldest son having died unmarried in 1613, Robert, the second son (see below), succeeded to the earldom; one of his daughters married Sir John Hobart, ancestor of the earls of Buckinghamshire.

Robert Sidney, 2nd earl of Leicester of the 1st creation (1593–1677), was born on the 1st of December 1595, and was educated at Christ Church, Oxford; he was called to the bar in 1618, having already served in the army in the Netherlands during his father's governorship of Flushing, and having entered parliament as member for Wilton in 1614. In 1616 he was given command of an English regiment in the Dutch service; and having rendered distinguished service, was created Viscount of Leicester in 1621, and in 1624 he was employed on diplomatic business in Denmark in 1625, and in France from 1636 to 1641. He was then appointed lord-lieutenant of Ireland in place of the earl of Strafford, but he waited in vain for instructions from the king, and in 1643 he was compelled to resign the office without having set foot in Ireland. He shared the literary and cultivated tastes of his family, without possessing the statesmanship of his uncle Sir Philip Sidney; his character was lacking in decision, and, as commonly befalls men of moderate views in times of acute party strife, he failed to win the confidence of either of the opposing parties. His sincere protestantism offended Laud, without being sufficiently extreme to please the puritans of the parliamentary faction; his fidelity to the king restrained him from any act tainted with rebellion, while his dislike for arbitrary government prevented him giving whole-hearted support to Charles I. When, therefore, the king summoned him to Oxford in November 1642, Leicester's conduct bore the appearance of vacillation, and his loyalty of uncertainty. Accordingly, after his resignation of the lord-lieutenancy of Ireland at the end of 1643, he retired into private life. In 1649 the younger children of the king were for a time committed to his care at Penshurst. He took no part in public affairs during the Commonwealth; and although at the Restoration he took his seat in the House of Lords and was sworn of the privy council, he continued to live for the most part in retirement at Penshurst, where he died on the 2nd of November 1677. Leicester married, in 1616, Dorothy, daughter of Henry Percy, 9th earl of Northumberland, by whom he had fifteen children. Of his nine daughters, the eldest, Dorothy, the "Sacharissa" of the poet Waller, married Robert Spencer, 2nd earl of Sunderland; and Lucy married John Pelham, by whom she was the ancestress of the 18th-century statesmen, Henry Pelham, and Thomas Pelham, duke of Newcastle. Algeron Sidney (q.v.), and Henry Sidney, earl of Romney (q.v.), were younger sons of the earl.

Leicester's eldest son, Philip, 3rd earl (1619–1668), known for most of his life as Lord Lisle, took a somewhat prominent part during the civil war. Being sent to Ireland in 1642 in command of a regiment of horse, he became lieutenant-general under Ormonde; he strongly favoured the parliamentary cause, and in 1647 he was appointed lord-lieutenant of Ireland by the parliament. Named one of Charles I.'s judges, he refused to take part in the trial; but he afterwards served in Cromwell's Council of State, and sat in the Protector's House of Lords. Lisle stood high in Cromwell's favour, but nevertheless obtained a pardon at the Restoration. He carried on the Sidney family tradition by his patronage of men of letters; and, having succeeded to the earldom on his father's death in 1677, he died in 1698, and was succeeded in the peerage by his son Robert, 4th earl of Leicester (1640–1702), whose mother was Catherine, daughter of William Cecil, 2nd earl of Salisbury.

LEICESTER, THOMAS WILLIAM COKE, EARL OF (1754–1842), English agriculturist, known as Coke of Norfolk, was the eldest son of Wenman Roberts, who assumed the name of Coke in 1750. In 1759 Wenman Coke's maternal uncle Thomas Coke, 1st earl of Leicester, died leaving him his estates, subject, however, to the life-interest of his widow, Margaret, Baroness de Clifford in her own right. This lady's death in 1775 was followed by that of Wenman Coke in 1776, when the latter's son, Thomas William, born on the 6th of May 1754, succeeded to his father's estates at Holkham and elsewhere. From 1776 to 1784, from 1790 to 1806, and again from 1807 to 1832 Coke was member of parliament for Norfolk; he was a friend and supporter of Charles James Fox and a sturdy and aggressive Whig, acting upon the maxim taught him by his father never to trust a Tory." Coke's chief interests, however, were in the country, and his fame is that of an agriculturist. His land around Holkham, which he bought and developed, he tilled and employed on his own account. He took a leading part in the introduction many improvements, obtained the best expert advice, and in a few years wheat was grown upon his farms, and the breed of cattle, sheep and pigs greatly improved. It has been said that "it is practically the realis the basis of every treatise on modern agriculture." Under his direction the rental of the Holkham estate is said to have increased from £2,000 to over £20,000 a year. In 1837 Coke was created earl of Leicester of Holkham. Leicester, who was a strong and handsome man and a fine sportsman, died at Longford Hall in Derbyshire on
the 30th of June 1842. He was twice married, and Thomas William, his son by his second marriage, succeeded to his earldom.

See A. M. W. Stirling, **Coke of Norfolk and his Friends** (1907).

LEICESTER, a municipal county and parliamentary borough, and the county town of Leicestershire, England; on the river Soar, a southern tributary of the Trent. Pop. (1801) 174,624, (1901) 211,570. It is 90 m. N.N.W. from London by the Midland railway, and is served by the Great Central and branches of the Great Northern and London and North-Western railways, and by the Leicester canal. This was the Roman *Ratae* (*Ratae Coritanorum*), and Roman remains of high interest are preserved. They include a portion of Roman masonry known as the Jewry Wall; several pavements have been unearthed; and in the museum, among other remains, is a milestone from the Fosse Way, marking a distance of 2 m. from *Ratae*. St Nicholas church is a good example of early Norman work, in the building of which Roman bricks are used. St Mary de Castro church, with Norman remains, including sedilia, shows rich Early English work in the tower and elsewhere, and has a Decorated spire and later additions. All Saints church has Norman remains. St Martin's is mainly Early English, a fine cruciform structure. St Margaret's, with Early English nave, has extensive additions of beautiful Perpendicular workmanship. North of the town are slight remains of an abbey of Black Canons founded in 1143. There are a number of modern churches. Of the Castle there are parts of the Norman hall, modernized, two gateways and other remains, together with the artificial Mount on which it was built. The following public buildings and institutions may be mentioned—municipal buildings (1879), old town hall, formerly the guild hall of Corpus Christi: market house, free library, opera house and other theatres and museum. The free library has several branches; there are also a valuable old library founded in the 17th century, and a library linked with the Shakespearean society. Among several hospitals are Trinity hospital, founded in 1333 by Henry Plantagenet, earl of Lancaster and of Leicester, and Wyggeston's hospital (1513). The Wyggeston schools and Queen Elizabeth's grammar school are amalgamated, and include high schools for boys and girls; there are also Newton's greencoat school for boys, and municipal technical and art schools. A memorial clock tower was erected in 1868 to Simon de Montfort and other historical figures connected with the town. The Abbey Park is a beautiful pleasure ground; there are also Victoria Park, St Margaret's Pasture and other grounds. The staple trade is hosiery, an old-established industry; there are also manufactures of elastic webbing, cotton and lace, iron-works, maltings and brick-works. Leicester became a county borough in 1888, and the bounds were extended and constituted one civil parish in 1892. It is a suffragan bishopric in the diocese of Peterborough. The parliamentary borough returns two members. Area, 8,861 acres.

The Romano-British town of *Ratae Coritanorum*, on the Fosse Way, was a municipality in A.D. 120-121. Its importance, both commercial and military, was considerable, as is attested by the many remains found here. Leicester (*Leicester* or *Leicesteria* or *Leugestria* or *Lexestria*) was called a "burh" in 918, and a city in Domesday. Until 874 it was the seat of a bishopric. In 1086 both the king and Hugh de grantemsiuld had much land in Leicester; by 1092 the latter's share had passed to Robert de Melun, to whom the rest of the town belonged before his death. Leicester thus became the largest mesne borough. Between 1103 and 1118 Robert granted his first charter to the burgesses, confirming their merchant guild. The portmarnote was confirmed by his son. In the 13th century the town developed as its own form of government by a mayor and 24 jurats. In 1264 Edward IV. made the mayor and 4 of the council justices of the peace. In 1480 Henry VIII., added 88 burgesses to the council for certain purposes, and made it a close body; he granted another charter in 1503. In 1580 Elizabeth incorporated the town, and gave another charter in 1590. James I. granted charters in 1605 and 1610; and Charles I. in 1630. In 1684 the charters were surrendered; a new one granted by James II. was rescinded by proclamation in 1688.

Leicester has been represented in parliament by two members since 1295. It has had a prescriptive market since the 13th century, now held on Wednesday and Saturday. Before 1228-1229 the burgesses had a fair from July 31 to August 14; changes were made in its date, which was fixed in 1360 at September 26 to October 2. It is now held on the second Thursday in October and three following days. In 1473 another fair was granted on April 27 to May 4. It is now held on the second Thursday in May and the three following days. Henry VIII. granted two three-day fairs beginning on December 8 and June 26; the first is now held on the second Friday in December; the second was held in 1888 on the last Tuesday in June. In 1307 Edward III. granted a fair for seventeen days after the feast of the Holy Trinity. This would fall in May or June, and may have merged in other fairs. In 1794 the corporation sanctioned fairs on January 4, June 1, August 1, September 13 and November 2. Other fairs are now held on the second Fridays in April and May and the Saturdays next before Easter and in Easter week. Leicester has been a centre for brewing and the manufacture of woolen goods since the 13th century. Knitting frames for hosiery were introduced about 1680. Boot manufacture became important in the 19th century.

See **Victoria County History**, Leicester; M. Bateson, Records of the Borough of Leicester (Cambridge, 1899).

LEICESTERSHIRE, a midland county of England, bounded N. by Nottinghamshire, E. by Lincolnshire and Rutland, S.E. by Northamptonshire, S.W. by Warwickshire, and N.W. by Derbyshire, also touching Staffordshire on the W. The area is 8236 sq. m. The surface of the county is an undulating tableland, the highest eminences being the rugged hills of Charnwood Forest (q.v.) in the north-west, one of which, Bardon Hill, has an elevation of 912 ft. The county belongs chiefly to the basin of the Soar, but which is divided into two distinct basins by the boundary with Derbyshire. The principal tributaries of the Trent in Leicestershire are the Soar, from whose old designation the Leire the county is said to derive its name, and which rises near Hinckley in the S.E., and forms the boundary with Nottinghamshire for some distance above its junction with the Trent. The Wreak, which, under the name of the Eye, rises on the borders of Rutland, flows S.W. to the Soar. Besides the Soar the other tributaries of the Trent are the Anker, touching the boundary with Warwickshire, the Devon and the Mease. A portion of the county in the S. draws to the Avon, which forms part of the boundary with Northamptonshire, and receives the Swift. The Welland forms for some distance the boundary with Northamptonshire.

Geology.—The oldest rocks in the county belong to the Charnian system, a Pre-Cambrian series of volcanic ashes, grès and slates, into which porphyroid and syenite were afterwards intruded. These rocks emerge from the plain formed by the Keuper Marls of the Triassic System as a group of isolated hills and peaks (known as Charnwood Forest); here are old mountain-range, the lower slopes of which are still buried under the surrounding Keuper Marls. West of this district lies the Leicestershire coalfield, where the poor state of development of the Carboniferous Limestone nowhere reach the Charnwood Forest. In which coal-same, the county is almost equally divided between the red Keuper Marls of the coal-bed and the grey limestones and shales of the Iliss on the cast. The former were deposited in lagoons into whose land was gradually lowered after a prolonged period of desert conditions. The argillaceous beds which follow the Keuper mark the interior fill of the coalfield. Near the surface, while later gravels, with remains of mammoth, reindeer, ,&c., border some of the present streams.

Slate, hones, slates, and roadstone from the Charnian rocks, limestone and cement from the Carboniferous and Lias, and coal from the Coal Measures are the chief mineral products.

Agriculture.—The climate is mild, and; on account of the inland position of the county, and the absence of any very high elevations, the rainfall is very moderate. The soil is of loamy character, the
LEICESTERSHIRE

richest district being that east of the Soar, which is occupied by pasture, while the corn crops are grown chiefly on a lighter soil resting above the Red Sandstone formation. About nine-tenths of the total area is under cultivation. The proportion of pasture land to arable is one to one and three quarters. Dairy-farming is extensively carried on, and the famous Stilton cheese is produced near Melton Mowbray. Cattle are reared in large numbers, while sheep form the New Leicester breed is well known. It was Sir Robert Gresley, who was born near Loughborough in 1725. He also improved the breed of horses by the importation of mares from Flanders.

The county is especially famed for fox-hunting, Leicester and Melton being favourite centres, while the kennels of the Quorn hunt are located at Quorn near Mount Sorrel. For this reason Leicestershire is rich in good riding horses.

Other Industries.—Coal is worked in the districts about Moira, Coleshill, and Loughborough, and is valuable, while the free stone is plentiful, gypsum is found, and a kind of granite, extensively used for paving, is obtained in the Charnwood district, as at Bardon and Mount Sorrel and at Sapcote and Stoney Stanton in the N.W. Branches radiate from Leicester to Melton Mowbray, to Coalville, and Chesterfield. The county was the chief mining centre in the last century, and the staple manufacture of Leicestershire is hosiery, for which the wool is obtained principally from home-bred sheep. Its principal seats are Leicester, Loughborough, Hinckley and Castle Donington. Cotton goods are also manufactured, and to a considerable extent in the county, as well as hosiery.

The main line of the Midland railway serves Market Harborough, Leicester, and Loughborough, having an important junction at Trent (on that river) for Derby and Nottingham. A branch from Market Harborough to Melton Mowbray was opened in 1852. In 1891, the population of the town was 32,973, and of the rural district 3,036,584, in 1891.

Population and Administration.—The area of the county is 725 square miles. The population of the county is 1,723,123. The county is divided into six Hundreds, which are divided into do electoral divisions (Eastern or Melton, Mid or Loughborough, Western or Bosworth, Southern or Harborough), each returning one member; and the parliamentary borough of Leicester returns two members. The county is in the diocese of Peterborough, and the county is divided into six districts: Southwell and Nottingham; and the parliamentary borough of Leicester returns two members. The county is in the diocese of Peterborough, and the county is divided into six districts: Southwell and Worcester; and comprises about 551 ecclesiastical parishes or districts, wholly or in part.

History.—The district which is now Leicestershire was reached in the 6th century by Anglian invaders, who made their way across the Trent, penetrated Charnwood Forest as far as Leicester, the fall of which may be dated at about 556. In 670 the district formed the kingdom of the Middle Angles within the kingdom of Mercia, and on the sub-division of the Mercian see in that year was formed into a separate bishopric having its see at Leicester. In the 6th century the district was subjugated by the Danes, and Leicester became one of the five Danish boroughs. It was reoccupied by Æthelflæd in 918, but the Northmen regained their supremacy shortly after, and the prevalence of Scandinavian place-names in the county bears evidence of the extent of their settlement.

Leicestershire probably originated as a shire in the 10th century, and at the time of the Domesday Survey was divided into the four wapentakes of Guthlaxton, Framland, Goschote and Gartree. The Leicestershire Survey of the 12th century shows an additional grouping of the wapentakes into small local hundreds, manorial rather than administrative divisions, which have completely disappeared. In the reign of Edward I. the divisions appear as hundreds, and in the reign of Edward III. the additional hundred of Sparkenhoe was formed out of Guthlaxton. Before the 17th century Goscote was divided into East and West Goscote, and since then the hundreds have undergone little change. Until 1566 Leicestershire and Warwickshire had a common sheriff, the shire-court for the former being held at Leicestercire.

Leicestershire constituted an archdeaconry within the diocese of Lincoln from 1092 until its transference to Peterborough in 1357. In 1291 it comprised the deaneries of Akeley, Leicester (now Christianity), Framland, Gartree, Goscote, Guthlaxton and Sparkenhoe. The deaneies remained unaltered until 1865. Since 1894 they have been as follows: East, South and West Akeley, Christianity, Framland (3 portions), Sparkenhoe (2 portions), Gartree (3 portions), Goscote (2 portions), Guthlaxton (3 portions).

Among the earliest historical events connected with the county were the siege and capture of Leicester by Henry II. in 1176 after the battle of the river Soar. The town was taken and burnt, and the castle was captured. In 1377, a tumult of the citizens of Leicester against King Edward III. was quelled with the utmost severity.

The battle of Bosworth was fought in the county. In the Civil War of the 17th century the greater part of the county favoured the parliament, though the mayor and some members of the corporation of Leicester sided with the king, and in 1642 the citizens of Leicester made a declaration of loyalty to King Charles I.

In 1645 Leicester was twice captured by the Royalist forces. Before the Conquest large estates in Leicestershire were held by Earl Ralph, Morcar, Waltheof and Harold, but the Domesday Survey of 1086 reveals an almost total displacement of English by Norman landholders, only a few estates being retained by Englishmen as under-tenants. The first lay-tenant mentioned in the survey is Robert, count of Meulan, ancestor of the Beaumont family and afterwards earl of Leicester, to whose fief was afterwards annexed the vast holding of Hugh de Grantmesnil, the Bishop of Lincoln. Mowbray of Gresley was a former owner of the county.

The woolen industry flourished in Leicestershire in Norman times, and in 1343 Leicestershire wool was rated at a higher value than that of most other counties. Coal was worked at Coleorton in the early 13th century and at Measham in the 17th century. The famous blue slate of Swithland has been quarried from the 13th to the 19th century, and the area of the field is about 350 acres.

LEIDEN—LEYD

The principal old castle is that of Ashby-de-la-Zouch, while at Kirby Muxloe there is a picturesque fortified mansion of Tudor date. There are several good Elizabethan mansions, as that at Laund in the E. of the county. Among modern mansions that of the dukes of Rutland, Belvoir Castle in the extreme N.E., is a massive mansion of the early 19th century, finely placed on the summit of a hill.

See Victoria County History, Leicestershire; W. Burton, Description of Leics. (London, 1822); L. G. Stone, History (ed., 1877); J. Nicholls, History and Antiquities of the County of Leicester (4 vols., London, 1795–1815); A. Curtis, A Topographical History of the County of Leicester (Ashby-de-la-Zouch, 1831).

LEIDEN or LEYDEN, a city in the province of South Holland, the kingdom of the Netherlands, on the Old Rhine, and a junction station 18 m. by rail S.S.W. of Haarlem. It is connected by steam tramway with Haarlem and The Hague respectively, and with the seaside resorts of Katwyk and Noordwyk. There is also a regular steamboat connexion with Katwyk, Noordwyk, Amsterdam and Gouda. The population of Leiden which, it is estimated, reached 100,000 in 1460, had sunk to 30,000 between 1766 and 1811, and in 1904 was 56,044. The two branches of the Rhine which enter Leiden on the east unite in the centre of the town, which is further intersected by numerous small and sombre canals, with tree-bordered quays and old houses. On the south side of the town pleasant gardens extend along the old Singel, or outer canal, and there is a large open space, the Van der Werf Park, named after the burgomaster, Pieter Andriassoon van der Werf, who defended the town against the Spaniards in 1574. This open space was formed by the accidental explosion of a powder ship in 1807, hundreds of houses being demolished, including that of the Elzevir family of printers. At the junction of the two arms of the Rhine stands the old castle (De Burcht), a circular tower built on an earthen mound. Its origin is unknown, but some connect it with Roman days and others with the Saxon Hengist. Of Leiden's old gateways only two—both dating from the end of the 13th century—are standing. Of the numerous churches the chief are the Hooglandsche Kerk, or the church of the Hooglandse Community, which was built in the 16th century; and the Pieterskerk (1315) with monuments to Scaliger, Boerhaave and other famous scholars. The most interesting buildings are the town hall (Stadhuis), a fine example of 16th-century Dutch building; the Gemeenlandshuis van Rynland (1596, restored 1878); the weight-house built by Pieter Post (1638); the former court-house, now a military storehouse; and the ancient gymnasium (1590) and the so-called city timber-house (Stads Timmerhuis) (1612), both built by Lieven de Key (c. 1560–1627).

In spite of a certain industrial activity and the periodical bustle of its cattle and dairy markets, Leiden remains essentially an academic city. The university is a flourishing institution. It was founded by William of Orange in 1575 as a reward for the heroic defence of the previous year, the tradition being that the citizens were offered the choice between a university and certain exemption from taxes. Originally located in the convent of St Barbara, the university was removed in 1581 to the convent of the White Nuns, the site of which it still occupies, though that building was destroyed in 1616. The presence within half a century of the date of its foundation of such scholars as Justus Lipsius, Joseph Scaliger, Francis Gomareus, Hugo Grotius, Jacobus Arminius, Daniel Heinsius and Guardas Johannes Vossius, at once raised Leiden university to the highest European fame, a position which the learning and reputation of Jacobus Gronovius, Hermann Boerhaave, Tiberius Hemsterhuis and David Ruhnken, among others, enabled it to maintain down to the end of the 18th century. The portraits of many famous professors since the earliest days hang in the university aula, one of the most memorable places, as Niebuhr called it, in the history of science. The university library contains upwards of 150,000 volumes and some valuable periodical portfolios, and is very rich in Oriental and Greek MSS. and old Dutch travels. Among the institutions connected with the university are the national institution for East Indian languages, ethnology and geography; the fine botanical gardens, founded in 1587; the observatory (1860); the natural history museum, with a very complete anatomical cabinet; the museum of antiquities (Museum van Oudheden), with specially valuable Egyptian and Indian departments; a museum of Dutch antiquities from the earliest times; and three ethnographical museums, of which the nucleus was P. F. von Siebold's Japanese collections. The anatomical and pathological laboratories of the university are modern, and the museums of geology and mineralogy have been restored. The university has now five faculties, of which those of law and medicine are the most celebrated, and is attended by about 1200 students.

The municipal museum, founded in 1860 and located in the old cloth-hall (Laecenhalle) (1640), contains a varied collection of antiquities connected with Leiden, as well as some paintings including works by the elder van Swenvenbergh, Cornelius Engelbrechtszoon, Lucas van Leiden and Jan Steen, who were all natives of Leiden. Jan van Goyen, Gabriel Metsu, Gerard Dou and van der Heyden were also natives of this town. There is also a small collection of paintings in the Meermansburg. The Thysian library occupies an old Renaissance building of the year 1655, and is especially rich in legal works and native chronicles. Noteworthy also are the collection of the Society of Dutch Literature (1766); the collections of casts and of engravings; the seamen's training school; the Remonstrant seminary, transferred hither from Amsterdam in 1873; the two hospitals (one of which is private); the house of correction; and the court-house.

Leiden is an ancient town, although it is not the Lugubrum Belorum of the Romans. Its early name was Leithen, and it was governed until 1420 by burgomasters, and afterwards by a regent of Holland. The most celebrated event in its history is its siege by the Spaniards in 1574. Besieged from May until October, it was at length relieved by the cutting of the dikes, thus enabling ships to deposit provision and men. The Spaniards, in their turn, were able to strengthen the fortifications, so that the weavering establishments (mainly broadcloth) of Leiden at the close of the 15th century were very important, and after the expulsion of the Spaniards Leiden cloth, Leiden baize and Leiden camlet were famous. Leiden manufacture of these cloths after the middle of the 19th century was altogether given up. Linen and woollen manufactures are now the most important industries, while there is a considerable trade in butter and cheese. Katwyk, or Katwijk, 6 m. N.W. of Leiden, is a popular seaside resort and fishing village. Close by are the great locks constructed in 1607 by the engineer, F. W. Conrad (d. 1608), through which the Rhine canal (or the so-called Leiden canal) is admitted into the sea at low tide. The shore and the entrance to the canal are strengthened by large dikes. In 1520 an ancient Roman camp known as the Brittenburg was discovered here. It was square in shape, each side measuring 82 3/4 ft., and the remains stood about 10 ft. high. By the middle of the 19th century it had been destroyed and covered by the sea. See P. J. Blok, Eene hollandsche stad in de middeleeuwen (The Hague, 1883); and for the siege see J. L. Motley, The Rise of the Dutch Republic (1890).

LEYDI, JOSEPH (1823–1891), American naturalist and paleontologist, was born in Philadelphia on the 9th of September 1823. He studied mineralogy and botany without an instructor, and graduated in medicine at the University of Pennsylvania in 1844. Continuing his work in anatomy and physiology, he visited Europe in 1848, but both before and after this period of foreign study lectured and taught in American medical colleges. In 1853 he was appointed professor of anatomy in the University of Pennsylvania, paying special attention to comparative anatomy. In 1884 he promoted the establishment in the same institution of the department of biology, of which he became director, and meanwhile taught natural history in Swarthmore College, near Philadelphia. His papers on biology and paleontology were very numerous, covering both fauna and flora, and ranging from microscopic forms of animal life to the higher vertebrates. He wrote also occasional papers on minerals. He was an active member of the Boston Society of Natural History and of the American Philosophical Society; and was the recipient of various American and foreign degrees and honours. His Cretaceous Reptiles of the United States (1865) and Contributions to the Extinct Vertebrate Fauna of the Western Territories (1873) were the most important of his larger works; the best known and most widely circulated was an Elementary Treatise on Human
LEIF ERICSSON—LEIGHTON, LORD

Anatomy (1862, afterwards revised in new editions). He died in Philadelphia on the 30th of April 1861.

LEIF ERICSSON [LEIF ERIKKSSON] (fl. 990-1000), Scandinavian explorer, of Icelandic family, the first known European discoverer of America, called Vineland, the Good, in North America. He was the son of Eric the Red (Eirik hinn raudri Thorvaldsson), the founder of the earliest Scandinavian settlements—from Iceland—in Greenland (985). In 990 he went from Greenland to the court of King Olaf Tryggvason in Norway, stopping in the Hebrides on the way. On his departure from Norway in 1000, the king commissioned him to proclaim Christianity in Greenland. As on his outward voyage, Leif was again driven far out of his course by contrary weather—this time to lands (in America) "of which he had previously had no knowledge," where "self-sown" wheat grew, and vines, and "mosur" (maple?) wood. Leif took specimens of all these, and sailing away came home safely to his father's home in Brattahlid on Ericscord in Greenland. On his voyage from this Vineland to Greenland, Leif rescued some shipwrecked men, and from this, and his discoveries, gained his nickname, "the Lucky Leif." Thus the first expedition of Thorfinn Karlsefni for the further exploration and settlement of the Far Western vine-country, it is recorded that certain Gaels, incredibly fleet of foot, who had been given to Leif by Olaf Tryggvason, and whom Leif had offered to Thorfinn, were put on shore to scout.

Such is the account of the Saga of Eric the Red, supported by a number of briefer references in early Icelandic and other literature. The less trustworthy history of the Flatey Book makes Biarni Herjulfsson in 985 discover Helluland (Labrador?) as well as another western land which he does not explore, not even permitting his men to land; while Leif Ericsson follows Biarni's discoveries, begins the exploration of Helluland, Markland and Vinland, and realizes some of the charms of the last named, where he winters. But this secondary authority (the Flatey Book narrative) which, till lately, formed the basis of all general knowledge as to Vinland, abounds in contradictions and difficulties from which Eric the Red Saga is comparatively free. Thus (in Flatey) the grapes of Vinland are found in winter and gathered in spring; the man who first finds them, Leif's foster-father Tyrker the German, gets drunk from eating the fruit; and the vines themselves are spoken of as big trees affording timber. Looking at the record in Eric the Red Saga, it would seem probable that Leif's Vinland answers to some part of southern Nova Scotia. See Vinland. (As to Helluland and Markland see Thorfinn Karlsefni.)

Thus Eric the Red's Saga are Nos. 541 and 557 of the Arne-Magnusen collection in Copenhagen; the MS. of the Flatey Book, so-called because it was the property of a family living on Flat Island in Broad Firth (Flatey in Breidafjord [B-i-ei-d-aj]), on the northwest coast of Iceland, in the Royal Library of Denmark, of which it is still one of the chief treasures. These leading narratives are supplemented by Adam of Bremen, Gestamn. v. Geweckn. v. ecclesiae pontificum, chap. 35 (247 Lappenberg) of his very early account of the Irish voyage; in Indonesia (c. 975); Adam's is the earliest extant reference to Vinland, c. 1070; but there have also notices of Vinland in the Libellus Islandarum of Ari Frodi (c. 1120), the oldest Icelandic historian; in the Kristini Saga (revised by Thorgilsson, in Horseson, 1662); in Eirikssone's Landnaming (c. 1250); in Grettis Saga (c. 1290); and in an Icelandic choreography of the 14th century, or earlier, partly derived from the famous traveller Abbot Nicolas of Thingeyri (1150).

Some recent works on "Vineland," or "Vineland Voyages," in the Memoires de la Societe royale des Antiquaires du Nord (Copenhagen, 1888); and Eirik's Saga Raudhau (Copenhagen, 1891); A. M. Reeves, Finding of Wineland the Good; the History of the Icelandic Discoveries of North America (London, 1890); Mason, in the leading 1892 number of the Annals of Antiquity (c. 1840); in Saga Magazine (c. 1850); in Grettis Saga (c. 1250); in Eirik's Saga Raudhau (c. 1290); and in an Icelandic choreography of the 14th century, or earlier, partly derived from the famous traveller Abbot Nicolas of Thingeyr (1150).

B. F. de Costa, Pre-Columbian Discovery of America by the Northmen (Albany, 1901); and Original Narratives of Early American History; The Northmen, Columbus and Cabot, pp. 1-66 (New York, 1906). See also C. Raymond Beasley, Seven Modern Geografie II, 48-83 (London, 1901); Josef Fischer, Die Entdechungen der Nor- manen in Amerika (Freiburg i. B., 1902); John Fiske, Discovery of America, in the Bulletin of the American Geographical Society (February, 1901); G. Vigfusson, Origines Islandicae (1905), which strangely expresses a preference for the Flatey Book account of the first sighting of the American continent "by the Norsee." (C. R. B.)

LEIGH, EDWARD (1602-1671), English Puritan and theologian, was born at Shewell, Leicestershire. He was educated at St. John's Hall, Oxford, 1622-1625, and subsequently became a member of the Middle Temple. In 1636 he entered parliament as member for Stafford, and during the Civil War held a colonelcy in the parliamentary army. He has sometimes been confounded with John Ley (1583-1662), and so represented as having sat in the Westminster Assembly. The public career of Leigh terminated with his expulsion from parliament with the rest of the Presbyterian party in 1648.

From an early age he had studied theology and produced numerous compilations, the most important being the Critica Sacra, containing Observations on all the Radices of the Hebrew Words of the Old and the Greek of the New Testament (1639-1644; new ed., 1662), for which the author received the thanks of the Westminster Assembly, to whom it was dedicated. His other works include Select and Choice Observations concerning the First Twelve Caesars (1640), and Twelve Tracts upon the New Testament (1659), of which a Latin translation by Arnold was published at Leipzig in 1752; A Body of Divinity (1654); A Treatise of Religion and Learning (1656); Annotations of the Five Poetical Books of the Old Testament (1657). Leigh died in Staffordshire in June 1671.

LEIGHTON, FREDERICK LEIGHTON, Baron (1830-1896), English painter and sculptor, the son of a physician, was born at Scarborough on the 19th of October 1830. His grandfather, Sir James Leighton, also a physician, was long resident at the court of St. Petersburg. Frederick Leighton was taken abroad at a very early age. In 1840 he learnt drawing at Rome under Signor Nell. The family moved to Dresden and Berlin, where he attended classes at the Academy. In 1843 he was sent to school at Frankfort, and in the winter of 1844 accompanied his family to Florence, where his future career as an artist was decided. There he studied with great industry and success under I. A. da Nardi and Cosi dal Bella, and attended anatomy classes under Zanetti; but he soon returned to complete his general education at Frankfort, receiving no further direct instruction in art for five years.

He went to Brussels in 1848, where he met Wiertz and Gallait, and painted some pictures, including "Cimabue finding Giotto," and a portrait of himself. In 1849 he studied for a few months in Paris, where he copied Titian and Correggio in the Louvre, and then returned to Frankfort, where he settled down to serious art work under Edward Steinele, whose pupil he declared he was "in the fullest sense of the term." Though his artistic training was mainly German, and his master belonged to the same school as Cornelius and Overbeck, he loved Italian art and Italy and the first picture by which he became known to the British public was "Cimabue's Madonna carried in Procession through the
Streets of Florence," which appeared at the Royal Academy in 1855. At this time the works of the Pre-Raphaelites almost absorbed public interest in art—it was the year of Holman Hunt's "Light of the World," and the "Rescue," by Millais. Yet Leighton's picture, painted in quite a different style, created a sensation, and was purchased by Queen Victoria. Although, since his infancy, he had only visited England once (in 1851, when he came to see the Great Exhibition), he was not quite unknown in the cultured and artistic world of London, as he had made many friends during a residence in Rome of some two years or more after he left Frankfurt in 1852. Amongst these were Giovanni Costa, Robert Browning, James Knowles, George Mason and Sir Edward Poynter, then a youth, whom he allowed to work in his studio. He also met Thackeray, who wrote from Rome to the young Millais: "Here is a versatile young dog, who will run you close for the presidentialship one of these days." During these years he painted several Florentine subjects—"Tybalt and Romeo," "The Death of Brunelleschi," a cartoon of "The Pest in Florence according to Boccaccio," and "The Reconciliation of the Montagues and the Capulets." He now turned his attention to themes of classic legend, which at first he treated in a "Romantic spirit." His next picture, exhibited in 1856, was "The Triumph of Music: Orpheus by the Power of His Art redeems his Wife from Hades." It was not a success, and he did not again exhibit till 1858, when he sent a little picture of "The Fisherman and the Syren " to the Royal Academy, and "Samson and Delilah " to the Society of British Artists in Suffolk Street. In 1858 he visited London and made the acquaintance of the leading Pre-Raphaelites—Rossetti, Holman Hunt and Millais. In the spring of 1859 he was at Capri, always a favourite resort of his, and made many studies from nature, including a very famous drawing of a lemon tree. It was not till 1860 that he settled in London, when he took up his quarters at a Orme Square, Bayswater, where he stayed till, in 1866, he moved to his celebrated house in Holland Park Road, with its Arab hall decorated with tiles. There he lived till his death. He now began to fulfill the promise of his "Cimabue," and by such pictures as "Paolo e Francesca," "The Star of Bethlehem," "Jezebel and Ahab taking Possession of Naboth's Vineyard," "Michael Angelo musing over his Dying Servant," "A Girl feeding Peacocks," and "The Odalisque," all exhibited in 1860-1863, rose rapidly to the head of his profession. The two latter pictures were marked by the rhythm of line and luxury of colour which are among the most constant attributes of his art, and may be regarded as his first dreams of Oriental beauty, with which he afterwards showed so great a sympathy. In 1864 he exhibited "Dante in Exile" (the greatest of his Italian pictures), "Orpheus and Eurydice" and "Golden Hours." In the winter of the same year he was elected an Associate of the Royal Academy. After this the main effort of his life was to realize visions of beauty suggested by classic myth and history. If we add to pictures of this class a few Scriptural subjects, a few Oriental dreams, one or two of tender sentiment like "Wedded" (one of the most popular of his pictures, and well known by not only an engraving, but a statuette modelled by an Italian sculptor), a number of studies of very various types of female beauty, "Teresina," "Biondina," "Bianca," "Moretta," &c., and an occasional portrait, we shall nearly exhaust the two classes into which Lord Leighton's work (as a painter) can be divided.

Amongst the finest of his classical pictures were—"Syracusan Bride leading Wild Beasts in Procession to the Temple of Diana " (1866), "Venus disrobing for the Bath " (1867), "Electra at the Tomb of Agamemnon," and "Helen and Rhodos " (1869), "Hercules wrestling with Death for the Body of Aechtis " (1871), "Clytemnestra " (1874), "The Daphnephoria " (1876), "Nausicaa " (1878), "An Idyll " (1881), two lovers under a spreading oak looking to the piping of a shepherd and gazing on the rich plain below; "Phryne " (1882), a nude figure standing in the sun; "Cyma and Iphigenia " (1884), "The Captive Andromache " (1888), now in the Manchester Art Gallery, with the "Last Watch of Hero " (1887), "The Bath of Psyche " (1890), now in the Chantrey Bequest collection; "The Garden of the Hesperides " (1892), "Perseus and Andromeda " and "The Return of Persephone," now in the Leeds Gallery (1891); and "Clytie," his last work (1896). All these pictures are characterized by nobility of conception, by almost perfect draughtsmanship, by colour which, if not of the highest quality, is always original, choice and effective. They often reach distinction and dignity of attitude and gesture, and occasionally, as in the "Hercules and Death," the "Electra" and the "Clytemnestra," a noble intensity of feeling. Perhaps, amidst the great variety of qualities which they possess, none is more universal and more characteristic than a rich elegance, combined with an almost fastidious selection of beautiful forms. It is the super-eminence of these qualities, associated with great decorative skill, that make the splendid pageant of the "Daphnephoria" the most perfect expression of his individual genius. Here we have his composition, his colour, his sense of the joy and movement of life, his love of art and nature at their purest and most spontaneous, and the result is a work without a rival of its kind in the British School.

Leighton was one of the most thorough draftsmen of his day. His sketches and studies for his pictures are numerous and very highly esteemed. They contain the essence of his conceptions, and much of their spiritual beauty and subtlety of expression was often lost in the elaboration of the finished picture. He seldom succeeded in retaining the freshness of his first idea more completely than in his last picture—"Clytie"—which was left unfinished on his easel. He rarely painted sacred subjects. The most beautiful of his few pictures of this kind was the "David musing on the Housetop " (1863). Others were "Elijah in the Wilderness " (1870), "Elisha raising the Son of the Shunammite " (1881) and a design intended for the decoration of the dome of St Paul's Cathedral, "And the Sea gave up the Dead which were in it " (1892), now in the Tate Gallery, and the terrible "Rizpah " of 1863. His diploma picture, "S. Jerome," exhibited in 1869, Besides these pictures of sacred subjects, he made some designs for Dalzil's Bible, which for force of imagination excelled the paintings. The finest of these are "Cain and Abel," and "Samson with the Gates of Gaza." Not so easily to be classed, but among the most individual and beautiful of his pictures, are a few of which the motive was purely aesthetic. Amongst these may specially be noted "The Summer Moon," two Greek girls sleeping on a marble bench, and "The Music Lesson," in which a lovely little girl is seated on her lovely young mother's lap learning to play the lute. With these, as a work produced without any literary suggestion, though very different in feeling, may be associated the "Eastern Slinger" and "in Birds in the Harvest-time: Moon-rise " (1873), a nude figure standing on a raised platform in a field of wheat.

Leighton also painted a few portraits, including those of Signor Costa, the Italian landscape painter, Mr F. P. Cockerell, Mrs Sutherland Orr (his sister), Amy, Lady Coleridge, Mrs Stephen Raili and (the finest of all) Sir Richard Burton, the traveller and Eastern scholar, which was exhibited in 1876 and is now in the National Portrait Gallery.

Like other painters of the day, notably G. F. Watts, Lord Leighton executed a few pieces of sculpture. His "Athlete struggling with a Python " was exhibited at the Royal Academy in 1877, and was purchased for the Chantrey Bequest collection. Another statue, "The Sluggard," of equal merit, was exhibited in 1886; and a charming statuette of a nude figure of a girl looking over her shoulder at a frog, called "Needless Alarms," was completed in the same year, and presented by the artist to Sir John Millais in acknowledgment of the gift by the latter of his picture, "Shelling Peas." He made the beautiful design for the reverse of the Jubilee Medal of 1887. It was also his habit to make sketch models in wax for the figures in his pictures, many of which are in the possession of the Royal Academy. As an illustrator in black and white he also deserves to be remembered, especially for the cuts to Dalzil's Bible, already mentioned, and the illustrations to George Eliot's "Romola," which appeared in the "Cornhill Magazine." The latter are full of the spirit of...
Florence and the Florentines, and show a keen sense of humour, elsewhere excluded from his work. Of his decorative paintings, the best known are the elegant compositions (in spirit fresco) on the walls of the Victoria and Albert Museum, representing "The Industrial Arts of War and Peace." There, also, is the refined and spirited figure of "Cimabue" in mosaic. In Lyndhurst church are mural decorations to the memory of Mr Pepys Cockerell, illustrating "The Parable of the Wise and Foolish Virgins."

Leighton's life was throughout marked by distinction, artistic and social. Though not tall, he had a fine presence and manners, at once genial and courtly. He was welcomed in all societies, from the palace to the studio. He spoke German, Italian and French, as well as English. He had much taste and love for music, and considerable gifts as an orator of a florid type. His Presidential Discourses (published, London, 1886) were full of elegance and culture. For seven years (1876-1883) he commanded the 20th Middlesex (Artists) Rifle Volunteers, retiring with the rank of honorary colonel, and subsequently receiving the Volunteer Decoration. Yet no social attractions or successes diverted him from his devotion to his profession, the welfare of his brethren in art or of the Royal Academy. As president he was punctilious in the discharge of his duties, ready to give help and encouragement to artists young and old, and his tenure of the office was marked by some wise and liberal reforms. He frequently went abroad, generally to Italy, where he was well known and appreciated. He visited Spain in 1866, Egypt in 1868, when he went up the Nile with Ferdinand de Lesseps in a steamer lent by the Khedive. He was at Damascus for a short time in 1873. It was his custom on all these trips to make little lively sketches of landscapes and buildings. These fresh little flowers of his leisure used to decorate the walls of his studio, and in the sale of its contents after his death realized considerable prices.

It was when he was in the full tide of his popularity and success, and apparently in the full tide of his personal vigour also, that he was struck with angina pectoris. For a long time he struggled bravely with this cruel disease, never omitting except from absolute necessity any of his official duties except during a brief period of rest abroad, which failed to produce the desired effect. His death occurred on the 25th of January 1896.

Leighton was elected an Academician in 1868, and succeeded Sir Francis Grant as President in 1878, when he was knighted. He was made a baronet in 1886, and was raised to the peerage in 1886, a few days before his death. He held honorary degrees at the universities of Oxford, Cambridge, Dublin, Edinburgh and Durham, and was an Associate of the Institute of France, a Commander of the Legion of Honour, and of the Order of Leopold. He was a Knight of the Coburg Order, "Dem Verdiens," and of the Prussian Order, "Pour le Mérite," and a member of at least ten foreign Academies. In 1850 he won a medal of the second class at the Paris Salon, and at the Exposition Universelle of 1880 a gold medal. As a sculptor he was awarded a medal of the first class in 1878 and the Grand Prix in 1880.

Leighton, Robert (1651-1684), archbishop of Glasgow, was born, probably in London (others say at Ushaven, Forfarshire), in 1651, the eldest son of Dr Alexander Leighton, the author of Zion's Plea against the Prelacie, whose terrible sufferings for having dared to question the divine right of Episcopacy, under the persecution of Laud, form one of the most disgraceful incidents of the reign of Charles I. Dr Leighton is said to have been of the old family of Ushaven in Forfarshire. From his earliest childhood, according to Burnet, Robert Leighton was distinguished for his saintly disposition. In his sixteenth year (1667) he was sent to the university of Edinburgh, where, after studying with distinguished success for four years, he took the degree of M.A. in 1671. His father then sent him to travel abroad, and he is understood to have spent several years in France, where he acquired a complete mastery of the French language. While there he passed a good deal of time with relatives at Douai who had become Roman Catholics, and with whom he kept up a correspondence for many years afterwards. Either at this time or on some subsequent visit he had also a good deal of intercourse with members of the Jansenist party. This intercourse contributed to the charity towards those who differed from him in religious opinion, which ever afterwards formed a feature in his character. The exact period of his return to Scotland has not been ascertained; but in 1641 he was ordained Presbyterian minister of Newbattle in Midlothian. In 1652 he resigned his charge and went to reside in Edinburgh. What led him to take this step does not distinctly appear. The account given is that he had little sympathy with the fiery zeal of his brother clergymen on certain political questions, and that this led to severe censures on their part.

Early in 1653 he was appointed principal of the university of Edinburgh, and primarius professor of divinity. In this post he continued for seven or eight years. A considerable number of his Latin prelections and other addresses (published after his death) are remarkable for the purity and elegance of their Latinity, and their subdued and meditative eloquence. They are valuable instructions in the art of living a holy life rather than a body of scientific divinity. Throughout, however, they bear the marks of a deeply learned and accomplished mind, saturated with both classical and patristic reading, and like all his works they breathe the spirit of one who lived very much above the world. His mental temper was too unlike the temper of his time to secure success as a teacher.

In 1661, when Charles II. had resolved to force Episcopacy once more upon Scotland, he fixed upon Leighton for one of his bishops (see SCOTLAND, CHURCH OF). Leighton, living very much out of the world, and being somewhat deficient in what may be called the political sense, was too open to the persuasions used to induce him to enter a sphere for which he instinctively felt he was ill qualified. The Episcopacy which he contemplated was that modified form which had been suggested by Archbishop Ussher, and to which Baxter and many of the best of the English Nonconformists would have readily given their adherence. It is significant that he always refused to be addressed as "my lord," and it is stated that when dining with his clergy on one occasion he wished to seat himself at the foot of the table.

Leighton soon began to discover the sort of men with whom he was to be associated in the episcopalate. He travelled with them in the same coach from London towards Scotland, but the companionship of those in high position, and their influence (as he doubted not they were of his), and having found that they intended to make a kind of triumphal entrance into Edinburgh, he left them at Morpeth and retired to the castle of Lochan's at Newbattle. He very soon lost all hope of being able to build up the church by the means which the government had set on foot, and his work, as he confessed to Burnet, "seemed to him a fighting against God." He did, however, what he could, governing his diocese (that of Dunblane) with the utmost mildness, as far as he could, preventing the persecuting measures in active operation elsewhere, and endeavouring to persuade the Presbyterian clergy to come to an accommodation with their Episcopal brethren. After a hopeless struggle of three or four years to induce the government to put a stop to their fierce persecution of the Covenanters, he determined to resign his bishopric, and went up to London in 1665 for this purpose. He so far worked upon the mind of Charles that he promised to enforce the adoption of milder measures, but it does not appear that any material improvement took place. In 1660 Leighton again went to London and made fresh representations on the subject, but little result followed. The slight disposition, however, shown by the government to accommodate matters appears to have inspired Leighton with so much hope that in the following year he agreed, though with a good deal of hesitation, to accept the archbishopric of Glasgow. In this higher sphere he redoubled his efforts with the Presbyterians to bring about...
some degree of conciliation with Episcopacy, but the only result was to embroil himself with the hot-headed Episcopal party as well as with the Presbyterians. In utter despair, therefore, of being able to be of any further service to the cause of religion, he resigned the archbishopric in 1674 and retired to the house of his widowed sister, Mrs Lightmaker, at Broadhurst in Sussex. Here he spent the remaining ten years, probably the happiest of his life, and died suddenly on a visit to London in 1684.

It is difficult to form a just or at least a full estimate of Leighton's character. He stands almost alone in his age. In some respects he was an anomaly before his time and in others after his; of the Scottish ecclesiastics of his time; and yet he seems to have had almost no influence in moulding the characters or conduct of his contemporaries. So intense was his absorption in the love of God that little room seems to have been left in his heart for human sympathy and action. But it be that there was otherwise something to repel in his outward manner? Burnet tells us that he had never seen him laugh, and very seldom even smile. In other respects, too, he gives the impression of standing aloof from human interests and ties. It may go for little that he never married, but for free a curious idiosyncrasy that he habitually cherished the wish (which was granted him) that he might die in an inn. In fact, holy meditation seems to have been the one absorbing interest of his life. At Dunblane he admirably preserved the memory of "the good bishop, silent and companionless, pacing up and down the sloping walk by the river's bank under the beautiful west window of his cathedral. And from a letter of the earl of Lothian to his countess it appears that in the days of his illness Leighton had been full of resolution in his charge at Newbattle, the main object which he had in view was to be left to his own thoughts. It is therefore not very wonderful that he was completely misjudged and even disliked both by the Presbyterians and Episcopalian.

It was characteristic of him that he could never be made to understand that anything which he wrote possessed the smallest value. None of his works were published by himself, and it is stated that he ordered those that had been extant to be destroyed. But fortunately for the world this charge was disregarded. Like all the best writing, it seems to flow without effort; it is the easy unaffected outcome of his saintly nature. Throughout, however, it is the language of a scholar and a man of perfect literary taste and style. He was one of those' says Burnet, "that are frequently of the raptures, such as are often found mingled with the Scottish pastoral theology of the 17th century. It was a common reproach against Leighton that he had leanings towards Roman Catholicism, and perhaps there is something in it. He had a sense that he could not upon the model of some of the saintly persons of that faith, such as Pascal and Thomas à Kempis.

The best account of Leighton's character is that of Bishop Burnet in Dunblane's admittance preserved the memory of "the good bishop, silent and companionless, pacing up and down the sloping walk by the river's bank under the beautiful west window of his cathedral. And from a letter of the earl of Lothian to his countess it appears that in the days of his illness Leighton had been full of resolution in his charge at Newbattle, the main object which he had in view was to be left to his own thoughts. It is therefore not very wonderful that he was completely misjudged and even disliked both by the Presbyterians and Episcopalian.

under the name of the Elster, discharge themselves into the Saale. The climate, though generally unhealthy, may be inclement in winter and hot in summer.

Leipzig is one of the most enterprising and prosperous of German towns, and in point of trade and industries ranks among German cities immediately after Berlin and Hamburg. It possesses the third largest German university, is the seat of the supreme tribunal of the German empire and the headquarters of the XIX. (Saxon) army corps, and forms one of the most prominent literary and musical centres in Europe. Its general aspect is imposing, owing to the number of new public buildings erected during the last 20 years of the 19th century. It consists of the old, or inner city, surrounded by a wide and pleasant promenade laid out on the site of the old fortifications, and of the very much more extensive inner and outer suburbs. Many thriving suburban villages, such as Reudnitz, Volkmarsdorf, Gohlis, Eutritzsch, Flugwitz and Lindenau, have been incorporated with the city, and with these accretions the population in 1905 amounted to 502,570. On the north-west the town is bordered by the fine public park and woods of the Rosenthal, and on the west by the Johannapark and by pleasant groves leading along the banks of the Pleisse.

The old town, with its narrow streets and numerous houses of the 16th and 17th centuries, with their high-pitched roofs, preserves much of its quaint medieval aspect. The market square, lying almost in its centre, is of great interest. Upon it the four main business streets, the Gimmachse-, the Peters-, the Hain- and the Katharinen-strassen, converge, and its north side is occupied by the beautiful old Rathaus, a Gothic edifice built by the burgomaster Hieronymus Lotter in 1556, and containing life-size portraits of the Saxon rulers. Superseded by the new Rathaus, it has been restored and accommodates a municipal museum. Behind the market square and the main street lie a labyrinth of narrow streets interconnected by covered courtyards and alleys, with extensive warehouses and cellars. The whole, in the time of the great fairs, when every available place is packed with merchandise and thronged with a crowd, presents the semblance of an oriental bazaar. Close to the old Rathaus is Auerbach's Hof, built about 1530 and interesting as being immortalized in Goethe's Faust. It has a curious old wine vault (Keller) which contains a series of mural paintings of the 16th century, representing the legend on which the play is based. Near by is the picturesque Königshaus, for several centuries the palace of the Saxon monarchs in Leipzig and in which King Frederick Augustus I. was made prisoner by the Allies after the battle of Leipzig in October 1813. At the end of the Petersstrasse, in the south-west corner of the inner town and on the promenade, lay the Pleissenburg, or citadel, modelled, according to tradition, on that of Milan, and built early in the 13th century. Here Luther in 1519 held his momentous disputation. The round tower was long used as an observatory and the building as a barracks. With the exception of the tower, which has been enceased and raised to double its former height—to 300 ft.—the citadel has been removed and its site is occupied by the majestic pile of the Parthenon in Raphael's style which is the town's chief feature. The business of Leipzig is chiefly concentrated in the inner city, but the headquarters of the book trade lie in the eastern suburb. Between the inner town and the latter lies the magnificent Augustusplatz, one of the most spacious squares in Europe. Upon it, on the side of the inner town and included within it, is the Augusteum, or main building of the university, a handsomely edifice containing a splendid hall (1900), lecture rooms and archaeological collections; adjoining it is the Paulinuskirche, the university church. The other sides of the square are occupied by the new theatre, an imposing Renaissance structure, designed by C. F. Langhans, the post office and the museum of sculpture and painting, the latter faced by the Mende fountain. The churches of Leipzig are comparatively uninteresting. The oldest, in its present form, is the Paulinuskirche, built in 1229-1240, and restored in 1900, with a curiously grooved cloister; the largest in the inner town is the Thomaskirche, with a high-pitched roof dating from 1496, and

memorable for its association with J. Sebastian Bach, who was organist here. Among others may be mentioned the new Gothic Petrikirche, with a lofty spire, in the south suburb. On the east is the Johanniskirche, round which raged the last conflict in the battle of 1813, when it suffered severely from cannon shot. In it is the tomb of Bach, and outside that of the poet Gellert. Opposite its main entrance is the Reformation monument, with bronze statues of Luther and Melanchthon, by Johann Schilling, unveiled in 1883. In the Johanna Park is the Lutherkirche (1886), and close at hand the Roman Catholic and English churches.

To the south-west of the new Rathaus, lying beyond the Pleisse and between it and the Johanna Park, is the new academic quarter. Along the fine thoroughfares, noticeable among which is the Karl Tauchnitz Strasse, are closely grouped many striking buildings. Here is the new Gewandhaus, or Konzerthaus, built in 1880-1884, in which the famous concerts called after its name are given, the old Gewandhaus, or Drapers' Hall, in the inner town having again been devoted to commercial use as a market hall during the fairs. Immediately opposite to it is the new university library, built in 1891, removed hither from the old monastic buildings behind the Augusteum, and containing some 500,000 volumes and 5000 MSS. Behind that again is the academy of art, one wing of which accommodates the industrial art school; and close beside it are the school of technical arts and the conservatoire of music. Between the university library and the new Gewandhaus stands a monument of Mendelssohn (1892). Immediately to the east of the school of arts rises the grand pile of the supreme tribunal of the German empire, the Reichsgericht, which compares with the Reichstag building in Berlin. It was built in 1888-1895 from plans by Ludwig Hoffmann, and is distinguished for the symmetry and harmony of its proportions. It bears an imposing dome, 225 ft. high, crowned by a bronze figure of Truth by O. Lessing, 18 ft. high. Opposite, on the outer side of the Pleisse, are the district law-courts, large and substantial, though not specially imposing edifices. In the same quarter stands the Grassi Museum (1863-1869) for industrial art and ethnology, and a short distance away are the palatial buildings of the Reichs and Deutsche Banks.

Farther east and lying in the centre of the book-trade quarter stand close together the Buchhändlerhaus, a museum of the book trade, both handsome red brick edifices in the German Renaissance style, erected in 1886-1890. South-west of these buildings, on the other side of the Johannis Park, are clustered the medical institutes and hospitals of the university—the infirmary, clinical and other hospitals, the physico-chemical institute, pathological institute, physiological institute, ophthalmic hospital, pharmacological institute, the schools of anatomy, the chemical laboratory, the zoological institute, the physico-mineralogical institute, the botanical garden and also the veterinary schools, deaf and dumb asylum, agricultural college and astronomical observatory. Among other noteworthy buildings in the quarter may be mentioned the Johannistift, an asylum for the aged poor, with a handsome front and slender spire. On the north side of the inner town and on the promenade are the handsomely exchange with library, and the reformed church, a pleasing edifice in late Gothic.

Leipzig has some interesting monuments; the Siegesdenkmal, commemorating of the wars of 1866 and 1870, on the market square, statues of Goethe, Leibnitz, Gellert, J. Sebastian Bach, Robert Schumann, Hahnemann, the homeopathist, and Bismarck. There are also many memorials of the battle of Leipzig, including an obelisk on the Randstädter-Steinweg, on the site of the bridge which was prematurely blown up, when Prince Poniatowski was drowned; a monument of cannon balls collected after the battle; a "relief" to Major Friccius, who stormed the outer Grimma gate; while on the battle plain itself and close to "Napoleonstein," which commemorates Napoleon's position on the last day of the battle, a gigantic obelisk surrounded by a garden has been planned for dedication on the hundredth anniversary of the battle (October 19, 1913).
The University and Education.—The university of Leipzig, founded in 1409 by a secession of four hundred German students from Prague, is one of the most influential universities in the world. It was a few years since the most numerously attended of any university in Germany, but it has since been outstripped by those of Berlin and of Munich. Its large revenues, derived to a great extent from house property in Leipzig and estates in Saxony, enable it, in conjunction with a handsome state subvention, to provide rich endowments for the professorial chairs. To the several faculties also belong various collegiate buildings, notably, to the legal, that of the Collegium boetae Virginis in the Petersstrasse, and to the philosophical the Rothe Haus on the promenade facing the theatre. The other educational institutions of Leipzig include the Nicolai and Thomas gymnasia, several "Realschulen," a commercial academy (Handelsschule), high schools for girls, and a large number of public and private schools of all grades.

Art and Literature.—The city has a large number of literary, scientific and artistic institutions. One of the most important is the museum, which contains about four hundred modern paintings, a large number of casts, a few pieces of original sculpture and a well-arranged collection of coins and curiosities. The association of historical society and the ethnographical and art-industrial collections in the Grassi Museum are also of considerable interest. The museum was erected with part of the munificent bequest made to the city by Dominic Grassi in 1834. As a musical centre Leipzig is known all over the world for its excellent conservatorium, founded in 1843 by Mendelssohn. The series of concerts given annually in the Gewandhaus is also of world-wide reputation, and the operatic stage of Leipzig is deservedly ranked among the finest in Germany. There are numerous vocal and orchestral societies, some of which have brought their art to a very high pitch of perfection. The prominence of the publishing interest has attracted to Leipzig a large number of gifted authors, and made it a literary centre of considerable importance. Over five hundred newspapers and periodicals are published here, including several of the most widely circulated in Germany. Intellectual interests of a high order have always characterized, Leipzig, and what Karl von Holtei once said of it is true to-day: "There is only one city in Germany that can compare with it; only a single city where one can forget that he is a Hessian, a Bavarian, a Swabian, a Prussian or a Saxony; only one city where, amid the opulence of the commercial world with which science is so gloriously allied, even the man who possesses nothing but his personality is honoured and esteemed; only one city, in which, despite a few narrownesses, all the advantages of a great, I may say a world-metropolis, are conspicuous! This city is, in my opinion, and in my experience, Leipzig."

Commerce, Fairs.—The outstanding importance of Leipzig as a commercial town is mainly derived from its three great fairs, which annually attract an enormous concourse of merchants from all parts of Europe, and from Persia, Armenia and other Asiatic countries. The most important fairs are held at Easter and Michaelsmas, and are said to have been founded as markets about 1170. The smaller New Year's fair was established in 1458. Under the fostering care of the margraves of Meissen, and then of the electors of Saxony they attained great popularity. In 1685 the margrave of Meissen granted a safe-conduct to all frequenter of the fairs, and in 1497 and 1507 the emperor Maximilian I largely increased their importance by prohibiting the holding of annual markets at any town within a wide radius of Leipzig. During the Thirty Years' War, the Seven Years' War and the troubles consequent upon the French Revolution, the trade of the Leipzig fairs considerably decreased, but it recovered after the accession of Saxony to the German Customs Union (Zollverein) in 1834, and for the next twenty years rapidly and steadily increased. Since then, owing to the greater facilities of communication, the transactions at the fairs have diminished in relative, though they have increased in actual, value. Wares that can be safely purchased by sample appear at the fairs in steadily diminishing quantities, while others, such as hides, furs and leather, which require to be actually examined, show as marked an increase. The value of the sales considerably exceeds £10,000,000 sterling per annum. The principal commodity is furs (chiefly Americans and Russian), of which about one and a quarter million pounds worth are sold annually; other articles disposed of are leather, hides, wool, cloth, linen and glass. The Leipzig wool-market, held for two days in June, is also important.

In the trades of bookselling and publishing Leipzig occupies a unique position, not only taking the first place in Germany, but even surpassing London and Paris in the number and total value of its sales. There are upwards of nine hundred publishers and booksellers in the town, and about eleven thousand firms in other parts of Europe are represented here. Several hundred booksellers assemble in Leipzig every year, and settle their accounts at their own exchange (Buchhändler-Börse). Leipzig also contains about two hundred printing-works, some of great extent, and a corresponding number of type-foundries, binding-shops and other kindred industries.

The book trades give employment to over 15,000 persons, and since 1585 Leipzig has grown into an industrial town of the highest rank. The town contains about 4500 persons.

The textile industries, cotton and yarn spinning and wool fabrication, 6000; and the making of scientific and musical instruments, including pianos, 2500. Other industries include the manufacture of artificial flowers, wax-cloth, chemicals, ethereal oils and essences, beer, mineral waters, tobacco and cigars, lace, indiarubber, wares, rush-work and paper, the preparation of furs and numerous other branches. These industries are mostly carried on in the suburbs of Plagwitz, Reudnitz, Lindenau, Gohlis, Eutritzsch, Konnewitz and the neighbouring town of Markranstädt.

Communications.—Leipzig lies at the centre of a network of railways giving it direct communication with all the more important cities of Germany. There are six main line railway stations, of which the Dresden and the Magdeburg lie side by side in the north-east corner of the promenade, the Thuringian and Berlin stations further away in the northern suburb; in the eastern is the Ellenburg station (for Breslau and the east) and in the south the Bavarian station. The whole traffic of these stations together amounts to about 117,500,000 passengers (largest in the world), lying on the sites of the Dresden, Magdeburg and Thuringian stations. The estimated cost, borne by Prussia, Saxony and the city of Leipzig is estimated at 6 million pounds sterling. The city has an extensive electric tramway system, bringing all the outlying suburbs into close connection with the business quarters of the town.

Population.—The population of Leipzig was quintupled within the 19th century, rising from 31,887 in 1801 to 155,088 in 1811, to 455,080 in 1900 and to 502,570 in 1905.

History.—Leipzig owes its origin to a Slav settlement between the Elster and the Pleisse, which was in existence before the year 900, and to the name given to the Slav word "Ippa," a lime tree. There was also a German settlement near this spot, probably round a castle erected early in the 10th century by the German king, Henry the Fowler. The district was part of the mark of Merseburg, and the villages of Leipzig were the lords of extensive areas around the settlements. In the 11th century Leipzig is mentioned as a fortified place and in the 12th it came into the possession of the margrave of Meissen, being granted some municipal privileges by the margrave, Otto the Rich, before 1150. Its favourable situation in the plain intersected by the principal highways of central Europe, together with the fostering care of its rulers, now began the work of raising Leipzig to the position of a very important commercial town. Its earliest trade was in the salt produced at Torgau, and of its enterprise the inhabitants constructed roads and bridges to lighten the journey of the traders and travellers whose way led to the town. Soon Leipzig was largely used as a depot by the merchants of Nuremberg, who carried on a considerable trade with the Polish Silesians. Permission was granted by the council (Rat) of the town, the importance of which was enhanced during the 15th century by several grants of privileges from the emperors. When Saxony was divided in 1485 Leipzig fell to the Albertine, or ducal branch of the family, whose head Duke George gave new rights to the burghers. This duke, however, at whose instigation the famous discussion between Luther and Johann von Eck took place in the Pleissenburg of Leipzig, inflicted some injury upon the
town's trade and also upon its university by the harsh treatment which he meted out to the adherents of the new doctrines; but under the rule of his successor, Henry, Leipzig accepted the teaching of the reformers. In 1547 during the war of the league of Schmalkalden, the city was laid waste by the forces of Charles V. Frederick I. It was not captured, although its suburbs were destroyed. These and the Pleissenburg were rebuilt by the elector Maurice, who also strengthened the fortifications. Under the elector Augustus I, emigrants from the Netherlands were encouraged to settle in Leipzig, its trade with Hamburg and with England was greatly extended.

During the Thirty Years' War Leipzig suffered six sieges and on four occasions was occupied by hostile troops, being retained by the Swedes for the longer period. A fire, which occurred in 1648, destroyed the city and its trade with Hamburg and with England was greatly extended. After 1650 its fortifications were strengthened; its finances put on a better footing; and its trade, especially with England, began again to prosper; important steps being taken within the city. The bishop's assistance, however, was withdrawn, and at the end of the 17th century the publishing trade began to increase very rapidly, partly because the severity of the censorship at Frankfort-on-the-Main caused many booksellers to remove to Leipzig. During the Seven Years' War Frederick the Great exacted a heavy contribution from Leipzig, but this did not seriously interfere with its prosperity. The fortifications were pulled down. The wars in the first decade of the 19th century were not on the whole unfavourable to the commerce of Leipzig, but in 1813 and 1814, owing to the presence of the allies attached to the Napoleonic empire, the condition of the city was very critical. Another revival, however, set in after the peace of 1815, and this was aided by the accession of Saxony to the German Zollverein in 1834, and by the opening of the first railway a little later. In 1831 the first railway station of the kind was opened, and in 1847 the reform of the university was completed. A riot in 1845, the revolutionary movement of 1848 and the Prussian occupation of 1866 were merely passing shadows. In 1879 Leipzig acquired a new importance by becoming the seat of the supreme court of the German empire.

The immediate neighbourhood of Leipzig has been the scene of several battles, two of which are of more than ordinary importance. These are the battles of Breitenfeld, fought on the 17th of September 1631, and of Leipzig under the command of the Elector, known in Germany as the Völkerschlacht, fought in October 1813 between Napoleon and the allied forces of Russia, Prussia and Austria. The title of the middle of the 18th century, Leipzig was the seat of the most influential body of literary men in Germany, over whom Johann Christoph Gottsched, like his contemporary, Samuel Johnson, in England, exercised a kind of literary dictatorship. Then, if ever, Leipzig deserved the title of "the Athens of the North." It was largely due to the efforts of Gottsched, of and Sebastian Bach and Mendelssohn filled musical posts here. Among the celebrated natives of the town are the philosophers Leibnitz and the composer Wagner.

Among the histories of Leipzig see E. Hasse, Die Stadt Leipzig und ihre Umgebung, geographisch und statistisch beschrieben (Leipzig, 1878); K. Gross, Geschichte der Stadt Leipzig (Leipzig, 1897-98); Rachel, Verwaltungsorganisation und Ämterwesen der Stadt Leipzig bis 1627 (Leipzig, 1902); G. Wustmann, Aus Leipzig's Vergangenheit (Leipzig, 1898); Bilderbuch aus der Geschichte der Stadt Leipzig (Leipzig, 1897); Leipzig durch drei Jahrhunderte, Atlas zur Geschichte des Leipziger Stadtbildes (Leipzig, 1891); Quellen zur Geschichte Leipzig (Leipzig, 1889-95); and Geschichte der Stadt Leipzig, 1627-1813 (Leipzig, 1890); and B. Reich, Leipzig, 1627-1813, a historical guide to Leipzig (Leipzig, 1891); and Die Universität Leipzig in der Geschichte der Stadt Leipzig (Leipzig, 1872-90); for other aspects of the city's life see Hirschfeld, Leipziger Grossindustrie und Grosshandel (Leipzig, 1887); Hassert, Die geographische Lage und Entdeckung Leipzigs und seiner Provinz (Leipzig, 1879); Aus der Geschichte der Stadt Leipzig (Leipzig, 1903); E. Friedberg, Die Universität Leipzig in Vergangenheit und Gegenwart (Leipzig, 1897); F. Zarncke, Die Statutenbücher der Universität Leipzig (Leipzig, 1881); E. Hasse, Geschichte der Leipziger Universität (Leipzig, 1885). Leipzig has been the scene of much controversy connected with the controversy see E. B. O'Callaghan, Documentary History of the State of New York (vol. 2, Albany, 1859).

LEISNIG, a town in the kingdom of Saxony, prettily situated on the Freiberger Mulde, 7 m. S. of Grimma by the railway from Leipzig to Dresden via Döbeln. Pop. (1895) 8147. On a high rock above the town stands the old castle of Mildenstein, now utilized as administrative offices. The industries include the manufacture of cloth, furniture, boots, buttons, cigars, beer, machinery and chemicals. Leisnig is a place of considerable
antiquity. About 1080 it passed into the possession of the counts of Groitzsch, but was purchased in 1157 by the emperor Frederick I., who committed it to the charge of counts. It fell to Melissen in 1365, and later to Saxony.

LEITH, a municipal and police burgh, and seaport, county of Midlothian, Scotland. Pop. (1901) 77,430. It is situated on the south shore of the Firth of Forth, 2½ m. N.E. of Edinburgh, of which it is the port and with which it is connected by Leith Walk, practically a continuous street. It has stations on the North British and Caedonian railways, and a branch line (N.B.R.) to Portobello. Lying at the mouth of the Water of Leith, which is crossed by several bridges and divides it into the parishes of North and South Leith, it stretches for 3½ m. along the shore of the Firth from Seafield in the east to near Granton in the west. There is tramway communication with Edinburgh and Newhaven.

The town is a flourishing centre of trade and commerce. St Mary's in Kirkgate, the parish church of South Leith, was founded in 1483, and was originally cruciform but, as restored in 1832, consists of an aisled nave and northwestern tower. Here David Lindsay (1531–1613), his minister, James VI.'s chaplain and afterwards bishop of Ross, preached before the king the thanksgiving sermon on the Gowrie conspiracy (1600). John Logan, the hymn-writer and reputed author of "The Ode to the Cuckoo," was minister for thirteen years; and in its graveyard lies the Rev. John Home, author of Douglas, a native of Leith. Near it in Constitution Street is St James's Episcopal church (1862–1869), in the Early English style by Sir Gilbert Scott, with an apsidal chancel and a spire 180 ft. high. The parish church of North Leith, in Madeira Street, with a spire 138 ft. high, is one of the best livings in the Established Church of Scotland. St Thomas's, at the head of Shira Brae, in the Gothic style, was built in 1843 by Sir John Gladstone of Fasque, who prior to his removal to Liverpool, where his son, W. E. Gladstone, was born—had been a merchant in Leith. The public buildings are wholly modern, the principal being of classic design. They include the custom house (1812) in the Grecian style; Trinity House (1817), also Grecian, containing Sir Henry Raeburn's portrait of Admiral Lord Duncan, David Scott's "Vasco da Gama Rounding the Cape" and other paintings; the markets (1818); the town hall (1828), with an Ionic façade on Constitution Street and a Doric porch on Charlotte Street; the corn exchange (1862) in the Roman style; the assembly rooms; exchange buildings; the public institute (1867) and Victorian public baths (1890). Trinity House was founded in 1553 as a home for old and disabled sailors, but on the decline of its revenues it became the licensing authority for pilots, its humane office being partly filled by the sailors' home, established about 1846 in a building adjoining the Signal Tower, and re-housed in 1881 in a building structure in the Scottish Baronial style in 1883–1884. Other charitable institutions include the hospital, John Watt's hospital and the smallpox hospital. The high school, built in 1806, for many years a familiar object on the west margin of the links, gave way to the academy, a handsome and commodious structure, to which are drafted senior pupils from the numerous board schools for free education in the higher branches. Here also is accommodated the technical college. Secondary instruction is given also in Crighthall Road school. A bronze statue of Robert Burns was unveiled in 1898. Leith Links, one of the homes of golf in Scotland, is a popular resort, on Lochend Road are situated Hawkhill recreation grounds, and Lochend Loch is used for skating and curling. There are small links at Newhaven, and in Trinity are Starbuck Park and Cargillfield playing ground. The east pier (1177 yds. long) and the west pier (1041 yds.) are favourite promenades. The waterway between them is the entrance to the harbour. Leith Cemetery is situated at Seafield and the Eastern cemetery in Easter Road.

The oldest industry is shipbuilding, which dates from 1313. Here in 1511 James IV. built the "St Michael," and veritable monstrous great ship, which tuke sae meikle timber that schee wrestled all the woods in Fyve, except Falkland wood, besides the timber that cam out of Nowarrow." Other important industries are engineering, sugar-refining (established 1737), meat-preserving, flour-milling, sailcloth-making, soap-boiling, rope and twine-making, tanning, chemical manures-making, wood-sawing, hosiery, biscuit-baking, brewing, distilling and lime-juice making. Of the old trade of glass-making, which began in 1682, scarcely a trace survives. As a distributing centre, Leith occupies a prominent place. It is the headquarters of the whisky business in Great Britain, and stores also large quantities of wine from Spain, Portugal and France. This pre-eminence is due to its excellent dock and harbour accommodation and capacious warehouses. The two old docks (1801–1807) cover 1½ acres; Victoria Dock (1852) 5 acres; Albert Dock (1863–1869) 1½ acres; Edinburgh Dock (1874–1881) 1½ acres; and the New Dock (1892–1901) 60 acres. There are several dry docks, of which the Prince of Wales Graving Dock (1858), the largest, measures 370 ft. by 60 ft. Space can always be had for more dock room by reclaiming the east sands, where in the 17th and 18th centuries Leith Races were held, the theme of a humorous descriptive poem by Robert Ferguson. Apart from coating trade there are constant sailings to the leading European ports, the United States and the British colonies.

In 1908 the tonnage of ships entering the harbour was (including coastwise trade) 1,975,457; that of ships clearing the harbour 1,993,277. The number of vessels registered at the port was 213 (net tonnage 146,799). The value of imports was £12,883,890, of exports £5,372,188. In summer there are frequent excursions to the Bass Rock and the Isle of May, North Berwick, Elie, Aberdour, Alloa and Stirling. Leith Fort, built in North Leith in 1779 for the defence of the harbour, is now the headquarters of the Royal Artillery in Scotland. Leith is the head of a fishery district. The town, which is governed by a provost, bailies and council elected by the inhabitants, has no member to parliament.

Leith figures as Inverleith in the foundation charter of Holyrood Abbey (1128). In 1529 Robert I. granted the harbour to the magistrates of Edinburgh, who did not always use their power wisely. They forbade, for example, the building of streets wide enough to admit a carriage, a regulation that allowed a number of narrow wynds and alleys in the town. Had the overlords been more considerate incorporation with Edinburgh would not have been so bitterly resisted. Several of the quaint bits of ancient Leith yet remain, and the appearance of the shore as it was in the 17th and 18th centuries, and even at a later date, was picturesque in the extreme. During the centuries of strife between Scotland and England its situation exposed the port to attack both by sea and land. At least twice (in 1540 and 1547) it was turned by the English, who also sacked the town in 1549—when the 1st earl of Hertford destroyed the first wooden pier—and 1547. In the troublous times that followed the death of James V., Leith became the stronghold of the party of the French regent, and the French forces seized it from 1548 to 1555, Leith after the death of the queen regent, not deeming herself secure in Edinburgh. In 1549 the town was walled and fortified by Montalbemart, seign d'Essé, the commander of the French troops, and is protected on the seaward side by the tents raised by the Earl of Strathearn's forces, and on their English allies. A house in Coaltill is thought to be the "handsome and spacious edifice" erected for her princely council by Mary of Guise. D'Essé's wall, pierced by six gates, was partly dismantled by Oliver Cromwell, but much of it still survives, and the town on which it still stands is described in 1650 as "a very fine town." The old tolbooth, in which William Maillard of Lethington, Queen Mary's secretary, poisoned himself in 1573, to avoid execution for adhering to Mary's cause, was demolished in 1769. Charles I. is said to have received the first tidings of the Irish rising while a prisoner in Leith. After the defeat of Smollett in his Scottish campaign built the Citadel in 1650 and the mounds on the links, known as "Giant's Brae" and "Lady Fife's Brae," were thrown up by the Protector as batteries. In 1699 the sailing of the French man-of-war Darien under Sir John Fisken from the island of Uist on the 17th of May, 1698, by Sir William Mackintosh of Borlum (1662–1743) and his force of Jacobite Highlanders captured the Citadel, of which only the name of Citadel Street and the archway in Cooper Street have preserved the memory. Aptly does the stone of SLEIRG represent the home of the Logans, from whom the superiority of Leith was purchased in 1553 by the queen regent. Sir Robert Logan (d. 1666) was allowed to have been one of the Gowrie conspirators and to have arranged the assassination of his friend, and if true, was not made until three years after his death, when his bones were exhumed for trial. He was then found guilty of high treason and sentenced to be hanged. But there is reason to suspect that the two regicides were executed for the deluded people escaped demolition at the Reformation and even the fine east
window was saved. In the vaults repose Sir Robert and other Logans, besides several of the lords Balmerino, and Lord Broughton's father lies in the kirkyard. The well of St Triduana, which was reputed to possess wonderful curative powers, vanished when the North British railway was constructed.

**LEITMERITZ** (Kodin LilenTico), a town and episcopal see of Bohemia, 45 ft. above the Pruth by rail, and 13,072, mostly German. It lies on the right bank of the Elbe, which becomes here navigable for steamers and is spanned by an iron bridge 1700 ft. in length. The fine cathedral, founded in 1575, was built in 1671 and contains some valuable paintings. The library of the episcopal palace, built between 1640 and 1701, possesses the oldest maps of Bohemia made in 1578 by Nicolaus Claudianus of Jung-Bundzau. Of the other churches that of All Saints dates from the 13th century. The town-hall, with its remarkable bell tower, dates from the 15th century. Leitmeritz is situated in the midst of a very fertile country, called the "Bohemian Paradise," which produces great quantities of corn, fruit, hops and wines. The beer brewed here enjoys a high reputation. On the opposite bank of the river, where the Eger discharges itself into the Elbe, lies Theresienstadt (pop. 7048), an important garrison town. It was formerly an important fortress, erected in 1178 by the emperor Joseph II. and named after his mother Maria Theresa, but the fortress was dismantled in 1855 and the area is now devoted to agricultural purposes.

This varied country has in general a floor of Carboniferous Limestone, which forms thinly scarped hills as it reaches the sea in Donegal Bay. The underlying sandstone appears at Lough Melvin, and again on the margin of a Silurian area in the extreme south. The Upper Carboniferous series, dipping gently southward, form mountainous country round Lough Allen, where the name of Slieve Aineric records the abundance of clay-ironstone beneath the coal seams. The sandstones and shales of this series are highly coveted towards the valley of the Bonnet, across which rises, in picturesque contrast, the heather-clad ridge of ancientgneiss which forms, in Benbo, the north-east end of the Ox Mountains.

The ironstone was smelted in the upland at Crevevejana down to 1859, and the coal is worked in a few thin seams.

The climate is moist and unsuitable for grain crops. On the higher districts the soil is stiff and cold, and, though abounding in stones, retentive of moisture, but in the valleys there are some fertile districts. Lime, marl and similar manures are abundant, and on the coastal seaweed is plentiful. The proportion of tillage to pasture is roughly as 3 to 5. Potatoes are grown, but oats, the principal grain crop, are scanty. The live stock consists chiefly of cattle, pigs and poultry. Coarse linens for domestic purposes are manufactured and coarse pottery is also made. The Sligo, Leitrim and Northern Counties railway, connecting Sligo with Enniskillen, crosses the northern part of the county, by way of Manor Hamilton; the Mullingar and Sligo line of the Midland Great Western touches the south-western boundary of the county, with a station at Carrick-on-Shannon; while connecting with this line at Drogheda is the Cavan and Leitrim railway to Ballinamore and Arigna, and to Belturbet in county Cavan.

The population (78,018 in 1891; 69,343 in 1901) decreases owing to emigration, the decrease being one of the most serious shown by any Irish county. It includes nearly 90% of Roman Catholics. The only towns are Carrick-on-Shannon (pop. 1118) and Manor Hamilton (933). The county is divided into five baronies. It is within the Connacht circuit, and assizes are held at Carrick-on-Shannon, and quarter sessions at Ballinamore, Carrick-on-Shannon and Manor Hamilton. It is in the Protestant diocese of Kilmore, and the Roman Catholic dioceses of Ardagh and Kilmore. In the Irish House of Commons two members were returned for the county and two for the boroughs of Carrick-on-Shannon and Jamestown, but at the Union the boroughs were disfranchised. The county divisions are termed the North and South, each returning one member.

With the territory which afterwards became the county Cavan, Leitrim formed part of Brenny or Breffny, which was divided into two principalities, of which Leitrim, under the name of Hy Bruin-Brenny, formed the western. Being for a long time in the possession of the O'Rourkes, descendants of Roderick, king of Ireland, it was also called Brenny O'Rourke. This family long maintained its independence; even in 1579, when the other existing counties of Connacht were created, the creation of Leitrim was deferred, and did not take place until 1582. Large confiscations were made in the reigns of Elizabeth and James I., in the Cromwellian period, and after the Revolution of 1688.

There are "Druidical" remains near Benbog and at Letterfyan, and important monastic ruins at Ceevee and near the Bonnet, with several antique monuments, and in the parish of Fenagh. There was a flourishing Franciscan friary at Jamestown. The abbey of Mohill, Annaduff and Drumleam are converted into parish churches. Among the more notable old castles are Manor Hamilton Castle, originally very extensive, but now in ruins, and Castle John on an island in Lough Scarr. There is a small village named Leitrim about 4 m. N. of Carrick-on-Shannon, which was once of enough importance to give its name to a barony and to the county, and is said to have been the seat of an early bishopric.

**LEIXOES** (Leixoes, Leixoes), a seaport and harbour of refuge of northern Portugal; in 41° 46' N., 8° 40' 35" W., 3 m. N. of the mouth of the Douro. Leixões is included in the parish of Matozinhos (pop. 1900, 7600) and constitutes the main port of the city of
Oporto (p.z.), with which it is connected by an electric tramway. The harbour, of artificial construction, has an area of over 220 acres, and admits vessels of any size, the depth at the entrance being nearly 20 ft. The transference of cargo to and from ships lying in the Leixões basin is effected entirely by means of lighters from Oporto. In addition to wine, &c., from Oporto, large numbers of emigrants to South America are taken on board here. The trade of the port is mainly in British hands, and large numbers of British ships call at Leixões on the voyage between Lisbon and Liverpool, London or Southampton.

LEJEUNE, LOUIS FRANÇOIS, BARON (1776-1848), French general, painter, and lithographer, was born at Versailles. As aide-de-camp to General Berthier he took an active part in many of the Napoleonic campaigns, which he made subjects of an important series of battle-pictures. The vogue he enjoyed in is due to the truth and vigour of his work, which was generally executed from sketches and studies made on the battlefield. When his battle-pictures were shown at the Egyptian Hall in London, a rail had to be put up to protect them from the eager crowds of sightseers. Among his chief works were "The Entry of Charles X. into Paris, 6 June 1825" at Versailles; "Episode of the Prussian War, October 1807" at Douai Museum; "Marengo" (1801); "Lodi," "Thabor," "Aboukir" (1804); "The Pyramids" (1806); "Passage of the Rhine in 1805" (1824), and "Moskawa" (1812). The German campaign of 1806 brought him to Munich, where he visited the workshop of Senefelder, the inventor of lithography. Lejeune was so fascinated by the possibilities of the new method that he then and there made the drawing on stone of his famous "Cossack" (printed by C. and T. Senefelder, 1806). While he was taking his dinner, and with his horses harnessed and waiting to take him back to Paris, one hundred proofs were printed, one of which he subsequently submitted to Napoleon. The introduction of lithography into France was greatly due to the efforts of Lejeune. Many of his battle-pictures were engraved by Coiny and Bovonet.

See Fournier-Sarlovèze, Le Général Lejeune (Paris, Libraire de l'aï). LEKAIN, the stage name of Henri Louis Cain (1728-1778), French actor, who was born in Paris on the 14th of April 1728, the son of a silversmith. He was educated at the Collège Mazarin, and joined an amateur company of players against which the Comédie Française obtained an injunction. Voltaire supported him for a time and enabled him to act in his private theatre and also before the duchess of Maine. Owing to the hostility of the actors it was only after a struggle of seventeen months that, by the command of Louis XV., he was received at the Comédie Française. His success was immediate. Among his best parts were Herod in Mariamme, Nero in Britannicus and similar tragic rôles, in spite of the fact that he was short and stout, with irregular and rather common features. His name is connected with a number of important romantic reforms. It was he who had the benches removed on which privileged spectators formerly sat encumbering the stage, Count Lauraguais paying for him an excessive indemnity demanded. Lekain also protested against the method of sing-song declamation prevalent, and endeavoured to correct the costuming of the plays, although unable to obtain the historic accuracy at which Talma aimed. He died in Paris on the 8th of February 1778.

His eldest son published his Mémoires (1801) with his correspondance with Voltaire, Garrick and others. They were reprinted with a preface by Talma in Mémoires sur l'art dramatique (1825).

LELAND, CHARLES GODFREY (1824-1903), American author, son of a merchant, was born at Philadelphia on the 15th of August 1824, and graduated at Princeton in 1845. He afterwards studied at Heidelberg, Munich and Paris. He was in Paris during the revolution of 1848, and took an active part in it. He returned to Philadelphia and after being admitted to the bar in 1851, devoted himself to contributing to periodicals, editing various magazines and writing books. At the opening of the Civil War he started at Boston the Continental Magazine, which advocated emancipation. In 1868 he became known as the humorous author of Hans Breitmann's Party and Ballads, which was followed by other volumes of the same kind, collected in 1871 with the title of Hans Breitmann's Ballads. These dialect poems, burlesquing the German American, at once became popular. In 1869 he went to Europe, and till 1880 was occupied, chiefly in London, with literary work; after returning to Philadelphia for six years, he again made his home in Europe, generally at Florence, where he died on the 20th of March 1903. Though his humorous verses were most attractive to the public, Leland was a serious student of folk-lore, particularly of the gipsies, his writings on the latter (The English Gypsies and their Language, 1872; The Gypsies, 1882; Gypsy Sorcery and Fortune-telling, &c., 1891, &c.) being recognized as valuable contributions to the literature of the subject. He was president of the first European folk-lore congress, held in Paris in 1889.

His other publications include Poetry and Mystery of Dreams (1853), Meister Karl's Sketch-book (1855), Pictures of Travel (1860), Sunshine in Thought (1862), Heine's Book of Songs (1863), The Mystic Lessor of Confucius (1876), Egyptian Sketch-book (1873), Abraham Lincoln (1879), The Minor Arts (1880), Algonquin Legends of New England (1884), Songs of the Sea and Loys of the Land (1895), Hans Breitmann in Tyrol (1895), One Hundred Profitable Acts (1897), Unpublished Legends of Vergil (1899), Koloshep the Master, and other Algonquin Poems (1903, with J. Dynedey Prince).

See his Memoirs (2 vols., 1893), and E. R. Pennell, C. G. Leland (1906).

LELAND (LELYAND or LAVLONDE), JOHN (c. 1506-1552), English antiquary, was born in London on the 13th of September, probably in 1506. He owed his education at St Paul's school under William Lilly, and at Christ's College, Cambridge, to the kindness of a patron, Thomas Myles. He graduated at Cambridge in 1521, and subsequently studied at All Souls College, Oxford, and in Paris under François Dubois (Sylvius). On his return to England he took holy orders. He had been tutor to Lord Thomas Howard, son of the 3rd duke of Norfolk, and to Francis Hastings, afterwards earl of Huntingdon. Meanwhile his learning had recommended him to Henry VIII., who presented him to the rectory of Peeplesingle in the marches of Caia in 1530. He was already librarian and chaplain to the king, and in 1533 he received a novel commission under the great seal as king's antiquary, with power to search for records, manuscripts and relics of antiquity in all the cathedrals, colleges and religious houses of England. Probably from 1534, and definitely from 1536 onwards to 1542, he was engaged on an antiquarian tour through England and Wales. He sought to preserve the MSS. threatened at the dissolution of the monasteries, but his powers did not extend to the actual collection of MSS. Some valuable additions, however, he did procure for the king's library, chiefly from the abbey of St Augustine at Canterbury. He had received a special dispensation permitting him to absent himself from his rectory of Peeplesingle in 1536, and on his return from his itinerary he received the rectory of Haseley in Oxfordshire; his support of the church policy of Henry and Cranmer being further rewarded by a canonry and prebend of King's College (now Christ Church), Oxford, and a prebend of Salisbury. In a Strenæ Henrici¹ (pr. 1546), addressed to Henry VIII. in 1545, he proposed to execute from the materials which he had collected in his journeys a topography of England, an account of the adjacent islands, an account of the British nobility, and a great history of the antiquities of the British Isles. He toiled over his papers at his house in the parish of St Michael le Querne, outside London, but he was not destined to complete these great undertakings, for he was certified insane in March 1550, and died on the 18th of April 1552.

¹ Re-edited in 1549 by John Bale as The labeourouse Journey and Sercke of J. Leland for Englands Antiquell, givet of him for a New Yearne Gifte, &c., modern edition by W. A. Copinger (Man-

LEJEUNE—LELAND, J.
LELAND, J.—LELEGES

Leland's MSS. were deposited by William Burton, the historian of Leicestershire, in the Bodleian at Oxford. They had in the meantime been freely used by other antiquaries, notably by John Bale, William Camden and Sir William Dugdale. The account of his journey in England and Wales in eight MS. quarto volumes, received its name The Itinerary of John Leland from Thomas Burton and was edited by Thomas Hearne (9 vols., Oxford, 1710-1712; other editions in 1745 and 1770). The scattered portions dealing with Wales are in the MSS. L H. Toulmin Smith in 1907. His other most important work, the Collectanea, in four folio MS. volumes, was also published by Hearne (6 vols., Oxford, 1715). His Commentarii de scriptoribus Britannicis, which had been used and disserted by the editor, was edited by Anthony Hall (2 vols., Oxford, 1709). Some of Leland's MSS. which formerly belonged to Sir Robert Cotton, passed into the possession of the British Museum. He was a Latin poet of some merit, his most famous piece being the Cygnea Cento (1545) in honour of Henry VIII. Many of his minor works are included in Hearne's editions of the Itinerary and the Collectanea.

LELAND, JOHN (1691-1766), English Nonconformist divine, was born at Wigan, Lancashire, and educated in Dublin, where he made such progress that in 1716, without having attended any college or hall, he was appointed first assistant and afterwards sole pastor of a congregation of Presbyterians in New Row. This office he continued to fill until his death on the 16th of January 1736. He received the degree of D.D. from Aberdeen in 1739. His first publication was A Defence of Christianity (1733), in reply to Matthew Tindal's Christianity as old as the Creation; it was succeeded by his Divine Authority of the Old and New Testaments asserted (1738), in answer to The Moral Philosopher of Thomas Morgan; in 1741 he published two volumes, in the form of two letters, being Remarks on [H. Dodwell's] Christianity not founded on Argument; and in 1753 Reflections on the late Lord Bolingbroke's Letters on the Study and Use of History. His View of the Principal Deistical Writers that have attempted to refute religion was published in 1754-1756. The chief work of Leland—"most worthy, painstaking and common-place of divines," as Sir Leslie Stephen called him—and in spite of many defects and inconsistencies is indispensable to every student of the deistic movement of the 18th century.

His Discourses on various Subjects, with a Life prefixed, was published posthumously (4 vols., 1768-1790).

LELAND STANFORD JR. UNIVERSITY, near Palo Alto, California, U.S.A., in the beautiful Santa Clara valley, was founded in 1885 by Leland Stanford 1 (1824-1880), and by his wife Jane Lathrop Stanford (1825-1903), as a memorial to their only child, Leland Stanford, Jr., who died in 1884 in his seventeenth year. The doors were opened in 1885 to 559 students. The university campus consists of Stanford's former Palo Alto farm, which comprises about 9000 acres. From the campus there are charming views of San Francisco Bay, of the Coast Range, particularly of Mount Hamilton some 30 m. E. with the Lick Observatory on its summit, of mountain foothills, and of the magnificent redwood forests toward Santa Cruz.

The buildings, designed originally by H. H. Richardson and completed by his successors, Shepley, Rutan and Coolidge, are of soft buff sandstone in a style adapted from the old California mission (Moorish-Romanesque) architecture, being long and low with wide colonnades, open arches and red tiled roofs. An outer surrounds an inner quadrangle, about a court which is 586 by 246 ft. and is faced by a continuous open arcade and adorned with large circular beds of tropical plants and flowers, consists of twelve one-storey buildings and a beautiful memorial church. Of the fourteen buildings of the outer quadrangle some are two storeys high. A magnificent memorial arch (100 ft. high), adorned with a frieze designed by John Evans, representing the "Progress of Civilization in America," and forming the main gateway, was destroyed by the earthquake of 1906. Outside the quadrangles are other buildings—a museum of art and archaeology, based on collections made by Leland Stanford, Jr., chemical laboratories, engineering work-shops, dormitories, a mausoleum of the founders, &c. There is a fine arboretum (300 acres) and a cactus garden. The charming views, the grace and harmonious colours of the buildings, and the tropic vegetation make a campus of wonderful beauty. The students in 1907-1908 numbered 1738, of whom 126 were graduates, 90 special students, and 590 women. 2 The university library (with the library of the law department) contained in 1908 about 107,000 volumes. A marine biological laboratory, founded by Timothy Hopkins, is maintained at Pacific Grove on the Bay of Monterey. The university has an endowment from its founders estimated at $30,000,000, including three great estates with 85,000 acres of farm and vineyard lands, and several smaller tracts; but the endowment was very largely in interest-bearing securities, income from which was temporarily cut off in the early years of the university's life by litigation. The founders wished the university "to qualify students for personal success and direct usefulness in life; to promote the public welfare by exercising an influence in behalf of humanity and civilization, teaching the blessings of liberty regulated by law, and inculcating love and reverence for the great principles of government as derived from the inalienable rights of man to life, liberty and the pursuit of happiness. There are no inflexible entrance requirements as to particular studies except English composition to ensure a degree of mental maturity, the minimum amount of preparation is fixed as that which should be given by four years in a secondary school, leaving to the applicants a wide choice of subjects (35 in 1906) ranging from ancient history to woodworking and machine shop. In the curriculum, liberty perhaps even greater than at Harvard is allowed as to "electives." Work on some major subject occupies about one-third of the undergraduate course; the remaining two-thirds (or more) is purely elective. The influence of sectarianism and politics is barred from the university by its charter, and by its private origin and private support. At the same time in its policy it is practically a state university of the most liberal type. Instruction is entirely free. The president of the university has the initiative in all appointments and in all matters of general policy. Within the university faculty power lies in an academic council, and, more particularly, in an advisory board of nine professors, elected by the academic council, to which all propositions of the president are submitted. The growth of the university has been steady, and its conduct has been praised. L. D. Smith.

See O. H. Elliot and O. V. Eaton, Stanford University and thereabouts (San Francisco, 1896), and the official publications of the university.

LELEGES, the name applied by Greek writers to an early people or peoples of which traces were believed to remain in Greek lands.

1. In Asia Minor.—In Homer the Leleges are allies of the Trojans, but they do not occur in the formal catalogue in Iliad.

2. The number of women attending the university as students in any semester is limited by the founding grant to 500.

3. President Jordan was born in 1851 at Gainesville, New York; was educated at Cornell, where he taught botany for a time, became an assistant to the United States fish commission in 1872; in 1885-1881 was president of the university of Indiana, where from 1879 he had been professor of zoology; and in 1891 was elected president of Leland Stanford Jr. University. An eminent ichthyologist, he wrote, with Barton Warren Evermann (b. 1853), of the United States Bureau of Fisheries, Fishes of North and Middle America (4 vols., 1866-1900), and Food and Game Fishes of North America (1902); and prepared A Guide to the Study of Fishes (1905).
LELEWEL—LELONG

407

bk. ii., and their habitat is not specified. They are distinguished from the Carins, with whom some later writers confused them; they have a long Altes, and a town Pediassus which was sacked by Achilles. The name Pediassus occurs (ii.) near Cycyus, (ii.) in the Troad on the Satrassos river, (iii.) in Caria, as well as (iv.) in Messenia. Alceaus (7th-8th centuries b.c.) calls Antandrus in the Troad Lelegian, but Herodotus (5th century) substitutes Pelasgian (v.). Gargara in the Troad also counted as Lelegian. Pherecydes (5th century) attributed to Leleges the coast land of Caria from Ephesus to Phocaea, with the islands of Samos and Chios, placing the "true Carins" farther south from Ephesos to Miletus. If this statement be from Pherecydes of Leros (c. 480) it has great weight. In the 4th century, however, Philippus of Thangela in south Caria describes Leleges still surviving as serfs of the true Carins, and Strabo, in the 1st century b.c., attributes to Leleges a well-marked group of deserted forts, tombs and dwellings which ranged (and can still be traced) from the neighbourhood of Thangela and Halicarnassus as far north as Miletus, the southern limit of the "true Carins" of Pherecydes. Plutarch also implies the history of Leleges (c. 5th century, stage of the Greek advance to the interior).

2. In Greece and the Aegean.—A single passage in the Hesiodic catalogue (fr. 136 Kinkel) places Leleges "in Deucalion's time," i.e. as a primitive people, in Locris in central Greece. Not until the 4th century b.c. does any other writer place them anywhere west of the Aegean. But the confusion of the Leleges with the Carins (immigrant conquerors akin to Lydians and Myrians, and probably to Phrygians) which first appears in a Cretan legend (quoted by Herodotus, but repudiated, as he says, by the Carins themselves) and is repeated by Callisthenes, Apollodorus and other later writers, led easily to the suggestion of Callisthenes, that Leleges joined the Carins in their (half legendary) raids on the coasts of Greece. Meanwhile other writers from the 4th century onwards claimed to discover them in Boeotia, west Arcarnania (Leucus), and later again in Thessaly, Euboa, Megara, Lacedaemon and Messenia. In Messenia they were reputed immigrant founders of Pylous, and were connected with the seafaring Taphians and Telebans of Homer, and distinguished from the Pelagians; in Pylus, Lacedaemon and Megara it was believed to be aboriginal. These European Leleges must be interpreted in connexion with the recurrence of place names like Pediassus, Physicus, Larymna and Abae, (a) in Caria, and (b) in the "Lelegian" parts of Greece; perhaps this is the result of some early migration; perhaps it is also the cause of these Lelegian theories.

Modern speculations (mainly corollaries of Indo-Germanic theory) add little of value to the Greek accounts quoted above. H. Klepert ("Über den Volksstamm der Leleges," in Monatsber. Berl. Akad., 1861) makes the Leleges an aboriginal people akin to Albianis and Illyrians; K. W. Deimling, Die Leleger (Leipzig, 1862), starts them in south-west Asia Minor, and brings them thence to Greece (practicaly the Greek view); G. F. Unger, "Hellas in Thasias," in Philologus, Suppl. ii. (1863), makes them Phocianian, and derives their name from Ἀλεξάς (cf. the names Blasenwald, Wahlke, E. Curtius (History of Greece, i.) distinguished a "Lelegian" phase of nascent Aegean culture. Most later writers follow Deimling, for whom the Leleges are monuments, e.g. Patton and Moret, "L'Expansion de l'Empire Hellenique," svi. 188-270. (J. L. M.)

LELEWEL, JOACHIM (1786-1851), Polish historian, geographer and numismatist, was born at Warsaw on the 29th of March 1786. His family came from Prussia in the early part of the 18th century; his grandfather was appointed physician to the reigning king of Poland, and his father caused himself to be naturalized as a Polish citizen. The original form of the name appears to have been Lnhof. Joachim was educated at the university of Vilna, and became in 1807 a teacher in a school at Kreminiec in Volhynia, in 1814 teacher of history at Vilna, and in 1818 professor and librarian at the university of Warsaw.

He returned to Vilna in 1821. His lectures enjoyed great popularity, and enthusiasm for him by the students is shown in the beautiful lines addressed to him by Mickiewicz. But this very circumstance made him obnoxious to the Russian government, and at Vilna Novosiltzef was then all-powerful. Lelewel was removed from his professorship in 1824, and returned to Warsaw, where he was elected a deputy to the diet in 1829. He joined the revolutionary movement with more enthusiasm than energy, and though the emperor Nicholas I. distinguished him as one of the most dangerous rebels, did not appear to advantage as a man of action. On the suppression of the rebellion he made his way in disguise to Germany, and subsequently reached Paris in 1831. The government of Louis Philippe ordered him to quit French territory in 1833 at the request of the Russian ambassador. The cause of this expulsion is said to have been his activity in writing revolutionary proclamations. He went to Brussels, where for nearly thirty years he earned a scanty livelihood by his writings. He died on the 20th of May 1861 in Paris, whither he had removed a few days previously.

Lelewel, a man of austere character, simple tastes and the loftiest conception of honour, was a lover of learning for its own sake. His literary activity was enormous, extending from his Edda Skandinawska (1807) to his Geographie des Arabes (2 vols., Paris, 1854). One of his most important publications was La Geographie du moyen âge (5 vols., Brussels, 1852-1857), which included (1840) of fifty plates entirely engraved by himself, for he rightly attached such importance to the accuracy of his maps that he would not allow them to be executed by any one else. His works on Polish history are based on minute and critical study of the documents; they were collected under the title Polska, dzieje i rzeczy jej rozpatrywane (Poland, her History and Affairs surveyed), in 20 vols. (Posen, 1853-1876). He intended to write a complete history of Poland on an extensive scale, but never accomplished the task. His method is shown in the little history of Poland, first published at Warsaw in 1823, under the title Dzieje Polski, and afterwards almost rewritten in the Histoire de Pologne (2 vols., Paris, 1844). Other works on Polish history which may be especially mentioned are La Pologne au moyen âge (3 vols., Posen, 1846-1851), an edition of the Chronique de Matthew Cholewa (1811) and Ancient Memorials of Polish Legislation (Księgi ustau polskich i małoziemskich). He also wrote on the trade of Carthage, on Pythaeas of Marseilles, the geographer, and two important works on numismatics, La Numismatique du moyen âge, Paris, vols., 1835; Études numismatiques, Brussels, 1840. While employed in the university library of Warsaw he studied bibliography, and the fruits of his labours may be seen in his Bibliograficznych Księg dwoje (A Couple of Books on Bibliography) (2 vols., Vilna, 1823-1826). The characteristics of Lelewel as an historian are great research and power to draw inferences from his facts; his style is too often careless, and his narrative is not picturesque, but his expressions are frequently terse and incisive.

He left valuable materials for a just comprehension of his career in the autobiography (Adventures while Proceeding Researches and Inquiries on Polish Matters) printed in his Polish.

LELONG, JACQUES (1665-1721), French bibliographer, was born at Paris on the 19th of April 1665. He was a priest of the Oratory, and was librarian to the establishment of the Order in Paris, where he spent his life in seclusion. He died at Paris on the 13th of July 1721. He first published a Bibliotheca sacra (1700), an index of all the editions of the Bible, then a Bibliothèque historique de la France (1710), a volume of considerable size, containing 17,487 items to which Lelong sometimes appends useful notes. His work is far from complete. He vainly hoped that his friend and successor Father Desmolets, would continue it; but it was resumed by Charles-Marie Fevret de Fontette, a councillor of the parlement of Dijon, who spent fifteen years of his life and a great deal of money in rewriting the Bibliothèque historique. The first two volumes (1758 and 1769) contained as many as 29,143 items. Fevret de Fontette died on the 16th of February 1772, leaving the third volume almost finished. It appeared in 1772, thanks to Barbaut de la Bruyère, who later brought out the 4th and 5th volumes (1775 and 1778).
LELY—LE MANS

In this new edition the Bibliothèque historique is a work of reference of the highest order; it is still of great value.

LELY, SIR PETER (1617–1680) English painter, was born at Soest, Westphalia, in 1617. His father, a military captain and a native of Holland, was originally called van der Vaes; the nickname of Le Lys or Lely, by which he was generally known, was adopted by his son as a surname. After studying for two years under Peter de Grebber, an artist of some note at Haarlem, Lely, induced by the patronage of Charles I. for the fine arts, removed to England in 1641. There he first painted historical subjects and landscapes; he soon became so eminent in his profession as to be employed by Charles to paint his portrait shortly after the death of Vandyck. He afterwards portrayed Cromwell. At the Restoration his genius and agreeable manners won the favour of Charles II., who made him his state-painter, and afterwards knighted him. He formed a famous collection, the best of his time, containing drawings, prints and paintings by the best masters; it sold by auction for no less than £60,000. His great example, however, was Vandyck, whom, in some of his most successful pieces, he almost rivals. Lely's paintings are carefully finished, warm and clear in colouring, and animated in design. The graceful posture of the heads, the delicate rounding of the hands, and the broad folds of the draperies are admired in many of his portraits. The eyes of the ladies are drowsy with languid sentiment, and allegory of a commonplace sort is too freely introduced. His most famous work is a collection of portraits of the ladies of the court of Charles II., known as "the Beauties," formerly at Windsor Castle, and now preserved at Hampton Court Palace. Of his few historical pictures, the best is "Susannah and the Elders," at Burleigh House. His "Jupiter and Europa," in the duke of Devonshire's collection, is also worthy of note. Lely was nearly so famous for crayon work as for oil-painting. Towards the close of his life he often retired to an estate which he had bought at Kew. He died of apoplexy in the Plazza, Covent Garden, London, and was buried in Covent Garden church, where a monument was afterwards erected to his memory. Pepys characterized Lely as "a mighty proud man and full of state." The painter married an English lady of family, and left a son and daughter, who died young. His only disciples were J. Greenhill and J. Buckshorn; he did not, however, allow them to obtain an insight into his special modes of work. (W. M. R.)

LE MAÇON (or LE MASSON), ROBERT (c. 1355–1443), chancellor of France, was born at Château du Loir, Sarthe. He was ennobled in March 1401, and became six years later a councillor of Louis II., duke of Anjou and king of Sicily. A partisan of the house of Orleans, he was appointed chancellor to Isabella of Bavaria on the 20th of January 1414, on the 20th of July commissary of the mint, and in June 1416 chancellor to the count of Ponthieu, afterwards Charles VII. On the 16th of August he bought the barony of Trèves in Anjou, and henceforward bore the title of seigneur of Trèves. When Paris was surprised by the Burgundians on the 16th of May 1418 he assisted at Trèves, at the siege of Treigny Duchâtel, in support of the dauphin. His devotion to the cause of the latter having brought on him the wrath of John the Fearless, duke of Burgundy, he was excluded from the political amnesty known as the peace of Saint Maur des Fossés, though he retained his seat on the king's council. He was by the dauphin's side when John the Fearless was murdered at the bridge of Montereau on the 10th of September 1410. He resigned the seals at the beginning of 1422; but he continued to exercise great influence, and in 1426 he effected a reconciliation between the king and the duke of Brittany. Having been captured by Jean de Langlec, seneschal of Auvergne, in August of the same year, he was shut up for three months in the château of Usson. When set at liberty he returned to court, where he staunchly supported Joan of Arc against all the cabals that menaced her. It was he who signed the patent of nobility for the Arc family in December 1429. In 1430 he was once more entrusted with an embassy to Brittany. Having retired from political life in 1436, he died on the 28th of January 1443, and was interred at Trèves, where his epitaph may still be seen.

See C. Bourcier, "Robert le Masson," in the Revue historique de l'Anjou (1873); and the Nouvelle biographie générale, vol. xxx. (J. V. *)

LE MAIRE DE BELGES, JEAN (1473–1525), French poet and historiographer, was born at Bavai in Hainault. He was a nephew of Jean Molinet, and spent some time with him at Valenciennes, where the elder writer held a kind of academy of poetry. Le Maire in his first poems calls himself a disciple of Molinet. In certain aspects he does belong to the school of the grands rhétoriqueurs, but his great merit as a poet is that he emancipated himself from the affectations and puerilities of his masters. This independence of the Flemish school he owed in part perhaps to his studies at the university of Paris and to the study of the Italian poets at Lyons, a centre of the French renascence. In 1503 he was attached to the court of Margaret of Austria, Duchess of Savoy, afterwards regent of the Netherlands. For this princess he undertook more than one mission to Rome; he became her librarian and a canon of Valenciennes. To her she addressed her most original poems, Épitres de l'amant vert, the amant vert being a green parrot belonging to his patroness. Le Maire gradually became more French in his sympathies, eventually entering the service of Anne of Brittany. His prose Illustrations des Gaules et singularités de Troye (1510–1512), largely adapted from Benoît de Sainte More, connects the Burghardian royal house with Hector. Le Maire probably died before 1525. Étienne Pasquier, Ronsard and Du Bellay all acknowledged their indebtedness to him. In his love for antiquity, his sense of rhythm, and even the peculiarities of his vocabulary he anticipated the Pléiade.

His works were edited in 1882–1885 by J. Stecher, who wrote the article on him in the Biographie nationale de Belgique.

LEMAÎTRE, FRANÇOIS ÉLIE JULES (1833– ), French critic and dramatist, was born at Vennezy (Loiret) on the 27th of April 1833. He became a professor at the University of Grenoble, but he had already become known by his literary criticisms, and in 1884 he resigned his position to devote himself entirely to literature. He succeeded J. J. de Chalon as dramatic critic of the Journal des Débats, and subsequently filled the same office on the Revue des Deux Mondes. His literary studies were collected under the title of Les Contemporains (7 series, 1886–1890), and his dramatic feuilletons as Impressions de théâtre (10 series, 1888–1898). His sketches of modern authors are interesting for the insight displayed in them, the unexpectedness of the judgments and the gaiety and originality of their expression. He published two volumes of poetry: Les Médailles (1886) and Petites orientales (1883); and also some volumes of contes, among them En marge des vieux livres (1905). His plays are: Révoltée (1886), Le député Leneau, and Le Mariage blanc (1801), Les Rois (1803), Le Pardon and L'âge difficile (1805), La Massière (1905) and Bertrade (1906). He was admitted to the French Academy on the 16th of January 1896. His political views were defined in La Campagne nationaliste (1902), lectures delivered to the provinces by him and Jules C. Cailliau. He conducted a nationalist campaign in the Écho de Paris, and was for some time president of the Ligue de la Patrie Française, but resigned in 1904, and again devoted himself to literature.

LE MANS, a town of north-western France, capital of the department of Sarthe, 77 m. S.W. of Chartres on the railway from Paris to Brest. Pop. (1906) town, 54,907, commune, 65,467. It is situated just above the confluence of the Sarthe and the Sèvre, on an elevation rising from the left bank of the Sarthe. Several bridges connect the old town and the new quarters which have sprung up round it with the more extensive quarter of Pré on the right bank. Modern thoroughfares are gradually superseding the winding and narrow streets of old houses; a tunnel connects the Place des Jacobins with the river side. The cathedral, built in the highest part of the town, was originally founded by St Julian, to whom it is dedicated. The nave dates from the 11th and 12th centuries. In the 13th century the choir was enlarged in the grandest and boldest style of that period. The transepts, which are higher than the nave, were rebuilt in the 15th century, and the bell-tower of the south
LE MARCHANT—LEMBERG

409

transcept, the lower part of which is Romanesque, was rebuilt in the 15th and 16th centuries. Some of the stained glass in the nave, dating from the first half of the 12th century, is the oldest in France; the west window, representing the legend of St Julian, is especially interesting. The south lateral portal (12th century) is richly decorated, and its statuettes exhibit many costumes of the period. The austere simplicity of the other part of the building is in striking contrast with the lavish richness of the ornamentation in the choir, where the stained glass is especially fine. The rose-window (15th century) of the north transept, representing the Last Judgment, contains many historical figures. The cathedral also has curious tapestries and some remarkable tombs, including that of Berengaria, queen of Richard Cœur de Lion. Close to the western wall is a megalithic monument nearly 15 ft. in height. The church of La Couture, which belonged to an old abbey founded in the 7th century by St Bertrand, has a porch of the 13th century with fine statuary; the rest of the building is older. The church of Notre-Dame du Pré, on the right bank of the Sarthe, is Romanesque in style. The hôtel de ville was built in 1756 on the site of the former castle of the counts of Maine; the presbytery (1760) occupies the site of the monastery of La Couture, and contains the library, the communal archives, and natural history and art collections; there is also an archaeological museum. Among the old houses may be mentioned the Hôtel du Grubaturo of the Renaissance, once a hospital for the canons and the so-called house of Queen Berengaria (16th century), meeting place of the historical and archaeological society of Maine. A monument to General Chancy commemorates the battle of Le Mans (1871). Le Mans is the seat of a bishopric dating from the 3rd century, of a prefect, and of a court of assizes, and headquarters of the IV. army corps. It has also tribunals of first instance and of commerce, a council of trade-arbitrators, a chamber of commerce, a branch of the Bank of France, an exchange, a lycée for boys, training colleges, a higher ecclesiastical seminary and a school of music. The town has a great variety of industries, carried on chiefly in the southern suburb of Pontlieue. The more important are the state manufacture of tobacco, the preparation of preserved vegetables, fish, &c. tanning, hemp-spinning, bell-founding, flour-milling, the founding of copper and other metals, and the manufacture of railway wagons, machinery and engineering material, agricultural implements, rope, cloth and stained glass. The fattening of poultry is an important local industry, and there is trade in cattle, wine, cloth, farm-produce, &c. The town is an important railway centre.

As the capital of the Aulerici Cenomanni, Le Mans was called Suindinium or Vindinium. The Romans built walls round it in the 3rd century, and traces of them are still to be seen close to the left bank of the river near the cathedral. In the same century the town was evangelized by St Julian, who became its first bishop. Ruled at first by his successors—notably St Aldric—Le Mans passed in the middle ages to the counts of Maine (q.v.), whose capital and residence it became. About the middle of the 12th century it acquired some municipal charter, but in 1693 the town was besieged by William the Conqueror and Oliver de St. John, who with a small band of men took control, which was recovered when the countship of Maine had passed to the Plantagenet kings of England. Le Mans was taken by John Augustus in 1180, recaptured by John, subsequently confiscated and later ceded to Queen Berengaria, who did much for its prosperity. It was several times besieged in the 15th and 16th centuries. In 1773 it was seized by the Vendéens, who were expelled by the Republican generals Marceau and Westermann after a stubborn battle in the streets. In 1790 it was again occupied by the Chouans.

The battle of Le Mans (10th-11th January 1871) was the culminating point of General Chancy’s fighting retreat into western France after the winter campaign in Beauce and Perche (see Franco-German War). The numerous, but ill-trained and ill-equipped, levies of the French were followed up by Prince Frederick Charles with the German II. Army, now very much weakened but consisting of soldiers who had in six months’ active warfare acquired the self-confidence of veterans. The Germans advanced with three army corps in first line and one in reserve. On the 9th of January the centre corps (III.) drove an advanced division of the French from Ardenay (13 m. E. of Le Mans). On the 10th of January Chancy’s main defensive position was approached. Its right wing was east of the Sarthe and 3–5 m. from Le Mans, its centre on the heights of Avon and the river Huisne behind it, and its left scattered along the western bank of the same river as far as Montfort (12 m. E. of Le Mans) and thence northward for some miles. On the 10th there was a severe struggle for the villages along the front of the French centre. On the 11th Chancy attempted a counteroffensive from many points, but owing to the misbehaviour of certain of his rawest levies, the Germans were able to drive him back, and as their cavalry now began to appear beyond his extreme left flank, he retreated in the night of the 11th on Laval, the Germans occupying Le Mans after a brief rearguard fight on the 12th.

LE MARCHANT, JOHN GASPAR (1756–1812), English major-general, was the son of an officer of dragoons, John Le Marchant, a member of an old Guernsey family. After a somewhat wild youth, Le Marchant, who entered the army in 1781, attained the rank of lieutenant-colonel in 1797. Two years before this he had designed a new cavalry sword; and in 1801 his scheme for establishing at High Wycombe and Great Marlow schools for the military instruction of officers was sanctioned by Parliament, and a grant of £30,000 was voted for the "royal military college," the two original departments being afterwards combined and removed to Sandhurst. Le Marchant was the first lieutenant-governor, and during the nine years that he held this appointment he trained many officers who served with distinction under Wellington in the Peninsula. Le Marchant himself was given the command of a cavalry brigade in 1810, and greatly distinguished himself in several actions, being killed at the battle of Salamanca on the 22nd of July 1812, after the charge of his brigade had had an important share in the English victory. He wrote several treatises on cavalry tactics and other military subjects, but few of them were published. By his wife, Mary, daughter of John Carey of Guernsey, Le Marchant had four sons and six daughters.

His second son, Sir Denis Le Marchant, Bt. (1795–1874), was educated at Eton and Trinity College, Cambridge, and was called to the bar in 1823. In 1830 he became secretary to Lord Chancellor Brougham, and in the Reform Bill debates made himself exceedingly useful to the ministers. Having been secretary to the board of trade from 1836 to 1841, he was created a baronet in 1841. He entered the House of Commons in 1846, and was under secretary for the home department in the government of Lord John Russell. He was chief clerk of the House of Commons from 1850 to 1871. He published a Life of his father in 1841, and began a Life of Lord Althorp which was completed after his death by his son; he also edited Horace Walpole’s Memoirs of the Reign of George III. (1845). Sir Denis Le Marchant died in London on the 30th of October 1874.

The third son of General Le Marchant, Sir John Gaspara Le Marchant (1818–1874), entered the English army, and saw service in the Carlist War of 1837–39. He was afterwards lieutenant-governor of Newfoundland (1847–1852) and of Nova Scotia (1852–1857); governor of Malta (1859–1864); commander-in-chief at Madras (1865–1868). He was made K.C.B. in 1865, and died on the 6th of February 1874.

LEMBERG (Pol. Lubów, Lat. Leopolis), the capital of the crownland of Galicia, Austria, 468 m. N.W. of Vienna by rail. Pop. (1900) 150,618, of whom over 80% were Poles, 10% Germans, and 8% Ruthenians; nearly 30% of the population were Jews. According to population Lemberg is the fourth city in the Austrian empire, coming after Vienna, Prague and Trieste. Lemberg is situated on the small river Peltew, an affluent of the Bug, in a valley in the Sarmatian plateau, and is surrounded by hills. It is composed of the inner town and of four suburbs.
The inner town was formerly fortified, but the fortifications were transformed into pleasure grounds in 1811. Lemberg is the residence of Roman Catholic, Greek Catholic and Armenian archbishops, and contains three cathedrals. The Roman Catholic cathedral was finished by Casimir IV. in 1480 in Gothic style; near it is a chapel (1609) remarkable for its architecture and sculpture. The Greek cathedral, built in 1740–1799 in the Basiliki style, is situated on a height which dominates the town. The Armenian cathedral was built in 1437 in the Armenian-Byzantine style. The Dominican church, built in 1740 after the model of St Peter's at Rome, contains a monument by Thorvaldsen to the Countess Dunin-Borkowska; the Greek St Nicholas church was built in 1792; and the Roman Catholic St Mary church was built in 1363 by the first German settlers. The town hall (1825–1837) with a tower 250 ft. high is situated in the middle of a square. Also notable are the hall of the estates (1677–1681), the industrial museum, the theatre, the palace of the Roman Catholic archbishop and several educational establishments. There are many beautiful private buildings, broad and well-paved streets, numerous squares and public gardens. At the head of the educational institutions stands the university, founded in 1772, transformed in 1809 into a université libre, and reorganized in 1817.

Since 1871 the language of instruction has been Polish, and in 1900 the university had 110 lecturers, and was attended by 2000 students. There are also a polytechnic, gymnasium—for Poles, Ruthenians and Germans respectively—seminaries for priests, training colleges for teachers, and other special and technical schools.

In Lemberg is the National Institute founded by Count Ossolinski, which contains a library of books and manuscripts relating chiefly to the history and literature of Poland, valuable antiquarian and scientific collections, and a printing establishment; also the Dzieduszycki museum with collections of natural history and ethnography relating chiefly to Galicia. Industrially and commercially Lemberg is the most important city in Galicia, its industries including the manufacture of machinery and iron wares, matches, starch and napkins, arrack and liqueurs, chocolate, chicory, leather and plasters of Paris, as well as brewing, corn-milling and brick and tile making. It has important commerce in linen, flax, hemp, wool and seeds, and a considerable transit trade. Of the 70,000 inhabitants around Lemberg, the most important is the Franz-Josef-Berg to the N.E., with an altitude of 1510 ft. Several beautiful parks have been laid out on this hill.

Leopold was founded about 1250 by the Ruthenian prince Leo Danilowicz, who moved here his residence from Halicz in 1270. From Casimir the Great, who captured it in 1340, it received the Magdeburg rights, and for almost two hundred years the public records were kept in German. In 1412 it became the see of a Roman Catholic archbishopric, and from 1432 until 1772 it was the capital of the Polish province of Russia (Terrac Rossia). During the whole period of Polish supremacy it was a most important city, and after the fall of Constantinople it greatly developed its trade with the East. In 1648 and 1655 it was besieged by the Cossacks, and in 1672 by the Turks. Charles XII. of Sweden captured it in 1704. In 1845 it was bombarded.

LEMERCIER, LOUIS JEAN NÉPOMUCÈNE (1777–1840), French poet and dramatist, was born in Paris on the 28th of April 1777. His father had been an intendant of his native town, Penthievre, the comte de Toulouse and the unfortunate princesse de Lamballe, who was the boy’s godmother. Lemercier showed great precocity; before he was sixteen his tragedy of Mélange was produced at the Théâtre Français. Clarissa Harlowe (1792) provoked the criticism that the author was not assez roulé pour peindre les roueries, the Tartuffe révolutionnaire, a parody full of the most audacious political allusions, was suppressed after the fifth representation. In 1795 appeared Lemercier’s masterpiece Agamemnon, called by Charles Lamb the last great antique tragedy in French literature. It was a great success, but was violently attacked later by Geoffroy, who stigmatized it as a bad caricature of Crébillon. Quatre métamorphoses (1799) was written to prove that the most indecent subjects might be treated without offence. The Pinto (1800) was the result of a wager that no further dramatic innovations were possible after the comedies of Beaumarchais. It is a historical comedy on the subject of the Portuguese revolution of 1640. This play was construed as casting reflections on the first consul, who had hitherto been a firm friend of Lemercier. His extreme freedom of speech finally offended Napoleon, and the quarrel proved disastrous to Lemercier’s fortune for the time. None of his subsequent work fulfilled the expectations raised by Agamemnon, with the exception perhaps of Frédegonde et Brunehaut (1821). In 1816 he was elected to the Academy, where he consistently opposed the romantists, refusing to give his vote to Victor Hugo. In spite of this, he has some pretensions to be considered the earliest of the romantic school. His Christophe Colomb (1809), advertised on the playbill as a comédie shakespeareenne (sic), represented the interior of a ship, and showed no respect for the unities. Its numerous innovations provoked such violent disturbances in the audience that one person was killed and future representations had to be guarded by the police. Lemercier wrote four long and ambitious epic poems: Hombre, Alexandre (1805), L’Atlantide, ou la théogonie amoureuse (1808), Moïse (1810) and Pankypooriaste (1819–1832), a distinctly romantic production in twenty cantos, which has the sub-title Spectacle infernal du XVIe siècle. In it 16th-century history, with Charles V. and Francis I. as principal personages, is played out on an imaginary stage by demons in the intervals of their sufferings. Lemercier died on the 7th of June 1840 in Paris.

LEMERY, NICOLAS (1645–1715), French chemist, was born at Rouen on the 17th of November 1645. After learning pharmacy in his native town he became a pupil of C. Glaser’s in Paris, and then went to Montpellier, where he began to lecture on chemistry. He next established a pharmacy in Paris, still continuing his lectures, but in 1683, being a Calvinist, he was obliged to retire to England. In the following year he returned to France, and turning Catholic in 1686 was able to reopen his shop and resume his lectures. He died in Paris on the 16th of June 1713. Lemery did not concern himself much with theoretical speculations, but holding chemistry to be a demonstrative science, confined himself to the straightforward exposition of facts and experiments. His principal work, his lecture-room was thronged with people of all sorts, anxious to hear a man who shunned the barren obscurities of the alchemists, and did not regard the quest of the philosopher’s stone and the elixir of life as the sole end of his science. Of his Cours de chimie (1675) he lived to see 13 editions, and for a century it maintained its reputation as a standard work. His other publications included Pharmacopée universelle (1667), Traité universel des drogues simples (1668), Traité de l’animine (1707), together with a number of papers contributed to the French Academy, one of which offered a chemical and physical explanation of underground fires, earthquakes, lightning and thunder. He discovered that heat is evolved when iron filings and sulphur are rubbed together to a paste with water, and the artificial volcan de Lemery was produced by burying underground a considerable quantity of this mixture, which he regarded as a potent agent in the causation of volcanic action.

He son LOUIS (1677–1743) was appointed physician at the Hôtel Dieu in 1764, and became demonstrator of chemistry at the Jardin du Roi in 1731. He was the author of a Traité des aliments (1702), and of a Dissertation sur la nature des os (1704), as well as of a number of papers on chemical topics.

LEMERY, a town of the province of Batangas, Luzon, Philippine Islands, on the Gulf of Balayan and the Pansipit river, opposite Taal (with which it is connected by a bridge), and about 50 m. S. of Manila. Pop. of the municipality (1903) 11,150. It has a fine church and convent. Lemery is situated on a plain in a rich agricultural district, which produces rice, Indian corn, sugar and cotton, and in which horses and cattle are bred. It is also a port for coasting vessels, and has an important trade with various parts of the archipelago. The language is Tagalog.
LEMGO, a town of Germany, in the principality of Lippe, in a broad and fertile plain, 9 m. N. from Detmold and on the railway Hameln-Lage. Pop. (1890) 8,840. Its somewhat gloomy aspect, enhanced by the tortuous narrow lanes flanked by gabled houses of the 15th century, has gained for it among countryfolk the sobriquet of the "Witches' nest" (Hexen-Nest). It is replete with interest for the antiquarian. It has four Evangelical churches, two with curiously leaning, lead-covered spires; an old town-hall; a gymnasiurn; and several philanthropic and religious institutions. Among the latter is the Jungfrauenstift, of which a princess of the reigning house of Lippe-Detmold has always been lady superior since 1366. The chief industry of Lemgo is the manufacture of meerschaum pipes, which has attained here a high pitch of excellence; other industries are weaving, brewing and the manufacture of leather and cigars. The town was a member of the Hanseatic league.

LEMIRE, ANTOINE MARIN (1733–1793), French dramatist and poet, was born in Paris on the 12th of January 1733. His parents were poor, but Lemierre found a patron in the collector-general of taxes, Dupin, whose secretary he became. Lemierre gained his first success on the stage with Hypermnestre (1758); Tèrèse (1761) and Idoménée (1764) failed on account of the subjects. Arlaxerce, modelled on Metastasio, and Guillaume Tell were produced in 1766; other successful tragedies were La Veuve de Malabar (1770) and Barnavel (1784). Lemierre revived Guillaume Tell in 1786 with enormous success. After the Revolution he professed great remorse for the production of a play inciting revolutionary principles, and there is no doubt that the horror of the excesses he witnessed hastened his death, which took place on the 4th of July 1793. He had been admitted to the Academy in 1781. Lemierre published La Peinture (1769), based on a Latin poem by the abbé de Marsy, and a poem in six cantos, Les Passes, ou les usages de l'année (1770), an unsatisfactory imitation of Ovid's Fasti.

His Œuvres (1810) contain a notice of Lemierre by R. Perrin, and his Œuvres choisies (1811) one by F. Fayolle.

LEMIRE, JULES AUGUSTE (1853– ), French priest and social reformer, was born at Vieux-Berquin (Nord) on the 23rd of April 1853. He was educated at the college of St Francis of Assisi, Hazebrouck, where he subsequently taught philosophy and rhetoric. In 1879 he was elected deputy for Hazebrouck and was returned unopposed at the elections of 1888, 1902 and 1906. He organized a society called La Ligue du coin de terre et du foyer, the object of which was to secure, at the expense of the state, a piece of land for every French family desirous of possessing one. The abbé Lemire sat in the chamber of deputies as a conservative republican and Christian Socialist. He protested in 1893 against the action of the Dupuy cabinet in closing the Boulevard of the Marais, characterizing it as "the expression of a policy of disdain of the workers.

In December 1903 he was seriously injured by the bomb thrown by the anarchist Vaillant from the gallery of the chamber.

LEMMING, the native name of a small Scandinavian rodent mammal Lemmus norvegicus (or L. lemmus), belonging to the mouse tribe, or Muridae, and nearly related, especially in the structure of its cheek-teeth, to the voles. Specimens vary considerably in size and colour, but the usual length is about 5 in., and the soft fur yellowish-brown, marked with spots of dark brown and black. It has a short, round head, obtuse muzzle, small beak-like eyes, and short rounded ears, nearly concealed by the fur. The tail is very short. The feet are small, each with five claws, those of the fore feet strongest, and fitted for scratching and digging. The usual habitat of lemmings is the high lands or fells of the great central mountain chain of Norway and Sweden, from the southern branches of the Langfjelde in Christiansand still to the North Cape and the Varangerfjord. South of the Arctic circle they are, under ordinary circumstances, confined to the plateaus covered with dwarf birch and juniper above the conifer-region, though in Tromsø amt and in Finnmarken they occur in all suitable localities down to the level of the sea. The nest, under a tussock of grass or a stone, is constructed of short dry straws, and usually lined with hair. The number of young in each nest is generally five, sometimes only three occasionally seven or eight, and at least two broods are produced annually. Their food is entirely vegetable, especially grass roots and shoots, shoots of dwarf birch, reindeer lichens and mosses, in search of which they form, in winter, long galleries through the turf or under the snow. They are restless, courageous and pugnacious little animals. When suddenly disturbed, instead of trying to escape they take upright, with their back against a stone, hissing and showing fight in a determined manner.

The circumstance which has given popular interest to the lemming is that certain districts of the cultivated lands of Norway and Sweden, where in ordinary circumstances they are unknown, are, at uncertain intervals varying from five to twenty or more years, overrun by an army of these little creatures, which steadily and slowly advance, always in the same direction, and regardless of all obstacles, swimming streams and even lakes of several miles in breadth, and committing considerable devastation on their line of march by the quantity of food they consume. In their turn they are pursued and harassed by crowds of beasts and birds of prey, as bears, wolves, foxes, dogs, wild cats, stoats, weasels, eagles, hawks and owls, and never spared by man; even domestic animals, as cattle, goats and reindeer, join in the destruction, stamping them to the ground with their feet, and even eating their bodies. Numbers also die from diseases produced apparently from overcrowding. None returns, and the onward march of the survivors never ceases until they reach the sea, into which they plunge, and swimming onwards in the same direction perish in the waves. These sudden appearances of vast bodies of lemmings, and their singular habit of persistently pursuing the same onward course of migration, have given rise to various speculations, from the ancient belief of the Norwegian peasants, shared by Olaus Magnus, that they fall down from the clouds, to the hypothesis that they are acting in obedience to an instinct inherited from ancient times, and still seeking the congenial home in the submerged Atlantis, to which their ancestors of the Miocene period were wont to resort when driven from their ordinary dwelling-places by crowding or scarcity of food. The principal facts regarding these migrations seem to be as follows. When any combination of circumstances has occasioned an increase of the numbers of the lemmings in their ordinary dwelling-places, impelled by the restless or migratory instinct possessed in a less developed degree by so many of their congeners, a movement takes place at the edge of the elevated plateau, and a migration towards the lower-lying land begins. The whole body moves forward slowly, always advancing in the
same general direction in which they originally started, but following more or less the course of the great valleys. They only travel by night; and, staying in congenial places for considerable periods, with unaccustomed abundance of provender, notwithstanding the destructive influences to which they are exposed, they multiply excessively during their journey, having more numerous and frequent than in their usual homes. The progress may last from one to three years, according to the route taken, and the distance to be traversed until the sea-coast is reached, which in a country so surrounded by water as the Scandinavian peninsula must be the ultimate goal of such a journey. This may be either the Atlantic or the Gulf of Bothnia, according as the migration has commenced from the west or the east side of the central elevated plateau. Those that finally perish in the sea, committing what appears to be a voluntary suicide, are only acting under the same blind impulse which has led them previously to cross shallower pieces of water with safety.

In Eastern Europe, Northern Asia and North America the group is represented by the allied L. obesus, and in Alaska, by L. nigripes; while the circumpolar banded lemming, Dicrostonyx torquatus, which turns white in winter, represents a second genus taking its name from the lemmings on one of the toes of the forefoot.

For habits of lemmings, see R. Collett, *Myodes lemmus*, its habits and migrations in Norway (Christiania Videnskab-Selskab Forhandlungen, 1895).

**LEMNISCATE** (from Gr. ἀνυψωτος, ribbon), a quartic curve, invented by Jacques Bernoulli (Acta Eruditorum, 1694) and afterwards investigated by Giulio Carlo Fagnano, who gave its principal properties and applied it to effect the division of a quadrant into $2\cdot a^2$, $2\cdot b^2$ and $2\cdot c^2$ equal parts. Following Archimedes, Fagnano desired the curve to be engraved on his tombstone. The complete analytical treatment was first given by Leonhard Euler. The lemniscate of Bernoulli may be defined as the locus of a point which moves so that the product of its distances from two fixed points is constant and is equal to the square of half the distance between these points. It is therefore a particular form of Cassini's oval (see Oval). Its cartesian equation, when the line joining the two fixed points is the axis of $x$ and the middle point of this line is the origin, is $(x^2 + y^2)^2 = a^4(x^2 - y^2)^2$ and the polar equation is $r^2 = a^2 \cos \theta$. The curve (fig. 1) consists of two loops symmetrically placed about the coordinate axes. The pedal equation is $r^2 = a^2\phi$, which shows

that it is the first positive pedal of a rectangular hyperbola with regard to the centre. It is also the inverse of the same curve for the same point. It is the envelope of circles described on the central radii of an ellipse as diameters. The area of the complete curve is $a^2$, and the length of any arc may be expressed in the form $\int (1 - x^2) \, dx$, an elliptic integral sometimes termed the *lemniscatic integral*.

The name lemniscate is sometimes given to any cruciform quartic curve having only one real finite branch which is symmetric about the axis. Such curves are given by the equation $x^2 + y^2 - b^2 y = c^2 x + b^2 y$. If $c$ be greater than $b$ the curve resembles fig. 2 and is sometimes termed the *fishtail-lemniscate*; if $c$ be less than $b$, the curve resembles fig. 3. The same name is also given to the first positive pedal of any central conic. When the conic is a rectangular hyperbola, the curve is the lemniscate of Bernoulli positively described. The *elliptic lemniscate* has for its equation $(x^2 + y^2)^2 = a^2 x^2 + b^2 y^2$ or $r^2 = a^2 \cos \theta + b^2 \sin^2 \theta$. The centre is a conjugate point (or acnode) and the curve resembles fig. 4. The *hyperbolic lemniscate* has for its equation $(x^2 + y^2)^2 = a^2 x^2 - b^2 y^2$ or $r^2 = a^2 \cos \theta - b^2 \sin^2 \theta$. In this case the centre is a cusp and the curve resembles fig. 5. These curves are instances of unicursal bicircular quartics.

**LEMNOS** (mod. *Lemnos*), an island in the northern part of the Aegean Sea. The Italian form of the name, Stalmine, *i.e.* the *Amna*, is not used in the island itself, but is commonly employed in geographical works. The island, which belongs to Turkey, is of considerable size: Pliny says that the coast-line measured 122 Roman miles, and the area has been estimated at 130 sq. m. Great part is mountainous, but some very fertile valleys exist, to cultivate which 2000 yoke of oxen are employed. The hill-sides afford pasture for 20,000 sheep. No forests exist on the island; all wood is brought from the coast of Rumelia or from Thasos. A few mulberry and fruit trees grow, but no olives. The population is estimated by some as high as 27,000, of whom 2000 are Turks and the rest Greeks, but other authorities doubt whether it reaches more than half this number. The chief towns are Kastro on the western coast, with a population of 4000 Greeks and 500 Turks, and Midros on the southern coast. Kastro possesses an excellent harbour, and the seat of all the trade carried on with the island. Greek, English and Dutch consul or consular agents were formerly stationed there; but the whole trade is now in Greek hands.

The archbishopric of Lemnos and Al Strati, a small neighbouring island with 2000 inhabitants, resides in Kastro. In ancient times the island was sacred to Hephaestus, who as the legend tells fell on Lemnos when his father Zeus hurled him headlong out of Olympus. This tale, as well as the name Aethaleia, sometimes applied to it, points to its volcanic character. It is said that fire occasionally blazed forth from Mosychlos, one of its mountains; and Pausanias (viii. 33) relates that a small island called Chryse, off the Lemnian coast, was swallowed up by the sea. All volcanic action is now extinct.

The most famous product of Lemnos is the medicinal earth, which is still used by the natives. At one time it was popular over western Europe under the name terra sigillata. This name, like the Gr. ἀμμον ἐφάργυς, is derived from the stamp impressed on each piece of the earth; in ancient times the stamp was the head of Artemis. The Turks now believe that this earth destroys the effect of any poison drunk from it—a belief which the ancients attached rather to the earth from Cape Kolias in Attica. Galen went to see the digging up of this earth (see Kuhn, *Medic. Gr. Opera*, xii. 172 sq.); on one day of each year a priestess performed the due ceremonies, and two shovelfuls of earth were then brought to the earth chief and stamped to an impression, the hill from which the earth was dug is a dry mound, void of vegetation, beside the village of Kotschinos, and about two hours from the site of Hephaestia. The earth was considered in ancient times a cure for old festering wounds, and for the bite of poisonous snakes.

The name Lemnos is said by Hecataeus (ap. Steph. Byz.) to have been a title of Cybele among the Thracians, and the earliest inhabitants are said to have been a Thracian tribe, called by the Greeks Sinties, i.e. "the robbers." According to a famous legend the women were all deserted by their husbands, and in revenge murdered every man on the island. From this barbarous act, the expression Lemnian deeds, ἀμμαμίς ἔργα, became proverbial. The Argonauts landing soon after found only women in the island, ruled over by Hysipyle, daughter of the old king Thoas. From the Argonauts and the Lemnian women were descanted the race called Minyae, whose king Euneus, son of Jason and Hysipyle, sent wine and provisions to the Greeks at Troy. The Minyae were expelled by a Pelasgian tribe who came from Attica. The historical element underlying these traditions is probably that the original Thracian people were gradually brought into communication with the Greeks as navigation began to unite the scattered islands of the Aegean (see Jasos); but the Thracian inhabitants were in comparison with the Greek inhabitants of Lemnos. The worship of Cybele was characteristic of Thrace, whither it spread from Asia Minor at a very early period, and it deserves notice that Hysipyle and Myrina (the name of one of the chief towns) are Amazon names, which are always connected with Asiatic Cybele worship. Coming down to a better authenticated period, we find that Lemnos was conquered by Otanex, one of the generals of Darius.
Hystaspis; but was soon reconquered by Miltiades, the tyrant of the Thracian Chersonese. Miltiades afterwards returned to Athens, and Lemnos continued an Athenian possession till the Macedonian empire absorbed it. On the vicissitudes of its history in the 3rd century B.C. see Köhler in Mittheil. Inst. Athen. i. 261. The Romans declared it free in 197 B.C., but gave it over in 166 to Athens, which retained nominal possession of it till the whole of Greece was made a Roman province. A colony of Attic cleruchs was established by Pericles, and many inscriptions on the island relate to Athenians. After the division of the empire, Lemnos passed under the Byzantine emperors; it shared in the vicissitudes of the eastern provinces, being alternately in the power of Greeks, Italians and Turks, till finally the Turkish sultans became supreme in the Aegean. In 1476 the Venetians successfully defended Kotschinos against a Turkish siege; but in 1457 Kastro was captured by the Turks from the Venetians after a siege of sixty-three days. Kastro was again besieged by the Russians in 1770.

Homer speaks as if there were one town in the island called Lemnos, but in historical times there was no such place. There were two towns, Myrina, now Kastro, and Hephæstia. The latter was the chief town; its coins are found in considerable number, the types being sometimes the Athenian goddesses and her owl, sometimes native religious symbols, the caps of the Dioscuri, Apollo, &c. Few coins of Myrina are known. They belong to the period of Attic occupation, and bear Athenian types. A few coins are also known which bear the name, not of either city, but of the whole island. Conze was the first to discover the site of Hephæstia, at a deserted place named Palaeokastro on the east coast. It had once a splendid harbour, which is now filled up. Its situation on the east explains why Miltiades attacked it first when he came from the Chersonese. It surrendered at once, whereas Myrina, with its very strong citadel built on a perpendicular rock, sustained a siege. It is said that the shadow of Mount Athos fell at sunset on a bronze cow in the agora of Myrina. Pliny says that Athos was 87 m. to the north-west; but the real distance is about 40 English miles. One legend localized in Lemnos still requires notice. Philectetes was left there by the Greeks on their way to Troy; and there he suffered ten years' agony from his wounded foot, until Ulysses and Neoptolemus induced him to accompany them to Troy. He is said by Sophocles to have lived beside Mount Hermacus, which Aeschylus (Agam. 262) makes one of the beacon points to flash the news of Troy's downfall home to Argos.

See Rhede, Res Lemnicæ; Conze, Reise auf den Inseln des Thracischen Archipel; (from which the above-mentioned facts about the present state of the island are taken); also Hunt in Walpole's Travels; Belon du Mans, Observations de plusieurs singularitès, &c.; Finlay, Greece under the Romans; von Hammer, Gesch. des islam. Reiches; Göt. Gel. Anz. (1837). The chief references in ancient writers are Iliad i. 593, 398, xiv. 299, &c.; Herod. iv. 145; Str. pp. 124, 330; Plin. iv. 23, xxxvi. 13.

LEMOINE, JOHN ÉMILE (1815-1892), French journalist, was born of French parents, in London, on the 17th of October 1815. He was educated first at an English school and then in France. In 1840 he began writing for the Journal des débats, on English and other foreign questions, and under the empire he held up to admiration the free institutions of England by contrast with imperial methods. After 1871 he supported Thiers, but his sympathies rather tended towards a liberalized monarchy, until the comte de Chambord's policy made such a development an impossibility, and he then ranged himself with the moderate Republicans. In 1857 Lemoine was elected to the French Academy, and in 1886 he was nominated a life senator. Distinguished though he was for a real knowledge of England among the French journalists who wrote on foreign affairs, his tone towards English policy greatly changed in later days, and though he never shared the extreme French bitterness against England as regards Egypt, he maintained a critical attitude which served to stimulate French Anglophobia.

He was a frequent contributor to the Revue des deux mondes, and published several books, the best known of which is his Etudes critiques et biographiques (1862). He died in Paris on the 14th of December 1892.

LEMON, MARK (1800-1870), editor of Punch, was born in London on the 30th of November 1800. He had a natural talent for journalism and the stage, and, at twenty-six, retired from less congenial business to devote himself to the writing of plays. More than sixty of his melodramas, operettas and comedies were produced in London. At the same time he contributed to a variety of magazines and newspapers, and founded and edited the Field. In 1841 Lemon and Henry Mayhew conceived the idea of a humorous weekly paper to be called Punch, and when the first number was issued, in July 1841, were joint-editors and, with the printer and engraver, equal owners. The paper was for some time unsuccessful, Lemon keeping it alive out of the profits of his plays. On the sale of Punch Lemon became sole editor for the new proprietors, and it remained under his control until his death, achieving remarkable popularity and influence. Lemon was an actor of ability, a pleasing lecturer and a successful impersonator of Shakespearian characters. He also wrote a host of novelettes and lyrics, over a hundred songs, a few three-volume novels, several Christmas fairy tales and a volume of jests. He died at Crawley, Sussex, on the 23rd of May 1870.

LEMON, the fruit of Citrus limonum, which is regarded by some botanists as a variety of Citrus medica. The wild stock of the lemon tree is said to be a native of the valleys of Kumaon and Sikkim in the North-West provinces of India, ascending to a height of 4000 ft., and occurring under several forms. Sir George Watt (Dictionary of Economic Products of India, ii. 352) regards the wild plants as wild forms of the lime or citron and considers it highly probable that the wild form of the lemon has not yet been discovered.

The lemon seems to have been unknown to the ancient Greeks and Romans, and to have been introduced by the Arabs into Spain between the 12th and 13th centuries. In 1494 the fruit was cultivated in the Azores, and largely shipped to England, but since 1838 the exportation has ceased. As a cultivated plant the lemon is now met with throughout the Mediterranean region, in Spain and Portugal, in California and Florida, and in almost all tropical and subtropical countries. Like the apple and pear, it varies exceedingly under cultivation. Risso and Pouteau enumerate forty-seven varieties of this fruit, although they maintain as distinct the sweet lime, C. limetta, with eight varieties, and the sweet lemon, C. Lumia, with twelve varieties, which differ only in the fruit possessing an insipid instead of an acid juice.

The lemon is more delicate than the orange, although, according to Humboldt, both require an annual mean temperature of 62° Fahr.
Unlike the orange, which presents a fine close head of deep green foliage, it forms a straggling bush, or small tree, 10 to 12 ft. high, with paller, more scattered leaves, and short angular branches with sharp spines in the axils. The flowers, which possess a sweet odour quite unique among citrus fruits, are snow-white, very fragrant, and in part hermaphrodite, and in part unisexual, the outside of the corolla having a purplish hue. The fruit, which is usually crowned with a nipple, consists of an outer rind or peel, the surface of which is more or less rough from the convex oil-contains imbedded in it a white {	extit{albedo}}, which is spongy and nearly tasteless, the whole of the interior of the fruit being filled with soft parenchymatous tissue, divided into about ten to twelve compartments, each generally containing two segments, or flat disks, not quite circular, the method of which is condensed in the leaves of the fruit. It will succeed.

In damp valleys it is liable like the orange (q.v.) to be attacked by a fungus sooty mould, the stem, leaves, and fruit becoming covered with a blackish dust. This is coincident with or subsequent to the bursting of the inner rind and varies much in thickness in different kinds, but is never so thick as in the citrus. As lemons are much more profitable to grow than oranges, on account of their keeping properties, and from their being less liable to injury during voyages, the lemon has largely displaced the orange in many countries.

The growth of the tree is excessively rapid, and the fruit is often seen in the valleys of Sicily, where it has scarcely been known within the memory of man. It is peculiar that the producing-leaves are crowded, a fact which is in some measure met by grafting healthy scions of the lemon on the bitter orange, but the softer scions do not bear fruit until they are eight or ten years old.

The lemon tree is exceedingly fruitful, a large one in Spain or Sicily ripening as many as three thousand fruits in favourable seasons. In the south of Europe lemons are collected more or less during every month of the year, but in the north of the tree the harvest takes place from the end of October to the end of December, those gathered during the last two months of the year being considered the best for keeping purposes. The fruit is gathered while still green. After collection the finest specimens are picked out and packed in cases, each containing about four hundred and twenty fruits, and also in boxes, three of which are equal to two cases, each lemon being separately packed in paper.

The remainder, consisting of ill-shaped or unseasonable growths, are reserved for the manufacture of essential oil and juice. The whole of the sound lemons are usually packed in boxes, but those which are not exported immediately are carefully packed over and the unsold ones removed before shipment. The exportation is continued as required until April and May. The large lemons with a rougher rind, which appear in the London market in July and August, are grown at Sorrento near Naples, and are allowed to remain on the trees until ripened before being exported.

Citrons are usually imported into England from a larger variety of the lemon cultivated in Sicily on higher ground than the common kind, from which it is distinguished by its thicker rind and larger size. This kind, known as the Spadafreuse lemon, is also allowed to remain on the trees until ripe, and when gathered the fruit is cut in half longitudinally and pickled in brine, before being exported in cases. Before candying the lemons are soaked in fresh water to remove the salt. Citrons are also exported from Sicily in the same way, but these are about six times as expensive as lemons, and a comparatively small quantity is shipped. Besides those exported from Messina and Palermo, lemons are also imported into England to a less extent from the Riviera of Genoa, and from Malaga in Spain, the latter being the most esteemed. Of the numerous varieties the wax lemon, the imperial lemon and the Gaeta lemon are considered to be the best. Lemons are also extensively grown in California and Florida.

Lemons of ordinary size contain about 2 oz. of juice, of specific gravity 1.039–1.046, yielding on an average 32–5 to 42–53 grains of sugar per ounce. The lemon family is as rich in the citron, which varies in different seasons, decreasing in lemons kept from February to July, at first slowly and afterwards rapidly, until at the end of that period it is all split up into sugar and carbonate acid—the specific gravity of the juice being in February 1.046, in May 1.041, and in July 1.027, while the fruit is largely altered in appearance. It has been stated that lemons may be kept for some months with scarcely perceptible deterioration by varnishing them with an alcoholic solution of shellac—the coating thus formed being easily removed when the fruit is required for household use by gently scratching it in the hands. Besides citric, lemon juice contains 3 to 4% of gum and sugar, albuminoid materials, malic acid and proteins, which the juice has a more acid reaction than is the case with dried lemon juice contains 54% of potash, besides 24% of phosphoric acid. In the white portion of the peel (in common with other fruits of the genus) a bitter principle called hesperidin has been found. It is a bitter glycoside, occurring in the peel and in the seeds, in which it is present in very small quantity, 15,000 grains of seed yielding only 80 grains of it. It differs from hesperidin in dissolving in potash without alteration. It melts at 275°F.

The lemon juice used in medicine is described in the British Pharmacopoeia as being the fruit of Citrus medica, var. Limonum. The preparations of lemon juice are of small importance. From the fresh peel is obtained the oleum limonis (dose 1/3 minima), which is also used in the treatment of carbuncles. It is also known as citreine or limonene, which also occurs in orange peel, and citral, the aldehyde of geraniol, which is the chief constituent of oil of roses. Of much importance is the succus limonis or lemon juice, 1 litre of which contains 44% of citric acid, besides the citrate of potassium (25%) and malic acid, free and combined. Ten per cent. of alcohol must be added to lemon juice if it is to be kept. From it are prepared the syrupus limonis (dose 1/2 drachmas), which consists of sugar, lemon juice and an alcoholic extract of lemon peel, and also citric acid itself. Lemon juice is practically pure citric acid (q.v.).

Essence or Essential Oils of Lemon.—The essential oil contained in the lemons is known as the lemon oil. It is manufactured chiefly in Sicily, at Reggio in Calabria, and at Mentone and Nice in France. The small and irregularly shaped fruits are employed while still in green, in which state the yield of oil is greatest, as the oil is exuded from the skin. The producing-leaves are used. The oil is extracted in November and December as follows. A workman cuts three longitudinal slices off each lemon, leaving a three-cornered central core having a small portion of rind at the apex. The rind is removed from one side, and the strips of peel are thrown in another place. Next day the pieces of peel are deprived of their oil by pressing from four or five times successively the outer surface of the peel (zest or flaved) bent into a convex shape, against a flat sponge held in the palm of the left hand and wrapped round the forefinger. The olive vessels in the rind, which are ruptured more easily in the fresh fruit than in the state in which lemons are imported, yield up their oil to the sponge, which when saturated is squeezed into an earthen vessel containing some spirituous liquid. The spirit is then removed by distillation, and the oil is put to several fractional distillations, until the purest qualities are obtained. The residue is then obtained in little quantities of volatile oil they contain. At Mentone and Nice a different process is adopted. The lemons are placed in an évasee à préparer, a shallow basin of pewter about 8½ in. in diameter, having a handle or ring on each edge, and fixed on a ring about 1½, 2, 3, 5 and 1 in. in diameter. A number of stout brass pins stand up about half an inch from the bottom of the vessel. The workman rubs a lemon over these pins, which rupture the oil vesicles, and the oil is afterwards condensed into another vessel that may separate from the aqueous liquid mixed with it. Filtered when it is known as Essence de citron au reste, or, in the English market, as perfumers' essence of lemon, inferior qualities being distinguished as druggists' essence of lemon. An additional product is obtained by immersing the scarified lemons in warm water and separating the oil which floats off. Essence de citron distillé is obtained by rubbing the surface of fresh lemons
LEMONNIER, A. L. C.

(4i5

(or of those which have been submitted to the action of the écuelle à piquer) on a coarse grater of tinned iron, and distilling the grated peel. The oil so obtained is colourless, and of inferior fragrance, and is sold at a lower price, while that obtained by the cold processes has a yellow colour and powerful odour.

Essence of lemon is chiefly brought from Messina and Palermo packed in copper bottles holding 25 to 50 killogrammes or more, and sometimes in tinned bottles of smaller size. It is said to be rarely found in a state of purity in commerce, almost all that comes into the market being diluted with the cheaper distilled oil. This fact may be considered as proved by the price at which the essence of lemon is sold in England, this being less than it costs the manufacturer to make it. When long kept the essence deposits a white greasy stearoptene, apparently identical with the bergaptene obtained from the essential oil of the Bergamot orange. The chief constituent of oil of lemon is the terpene, CinH16OH2, which, like oil of turpentine, readily yields crystals of terpin, CinH16O4H, but differs in yielding the crystalline compound, CinH16+2Cl, oil of turpentine forming one having the formula CinH16+HCl. Oil of lemons also contains, according to Tilden, another hydrocarbon, CinH16OH boiling at 320-32 Fahr., a small amount of cymene, and a compound acetic ether, C6H5-C6H5-O. The natural essence of lemon not being wholly soluble in rectified spirit of wine, an essence for culinary purposes is sometimes prepared by digesting 6 oz of lemon peel in one pint of pure alcohol of 95% and, when the rind has become brittle, which takes place in about two and a half days, powdering it and percolating the alcohol through it. This article is known as "lemon flavour."

The name lemon is also applied to some other fruits. The Java lemon is the fruit of Citrus javanica, the pear lemon of a variety of C. Limetta, and the pearl lemon of C. margarita. The fruit of a passion-flower, Passiflora laurifolia, is sometimes known as the water-lemon, and that of a Berberidaceous plant, Podophyllum peltatum, as the wild lemon. In France and Germany the lemon is known as the citron, and hence much confusion arises concerning the fruits referred to in different works. The essential oil known as oil of cedar is usually a factitious article instead of being prepared, as its name implies, from the citron (Fr. citron). An essential oil is also prepared from C. luma, at Squilace in Calabria, and has an odour like that of Bergamot but less powerful.

The sour lime is Citrus aida, generally regarded as a var. (acida) of C. medica. It is a native of India, ascending to about 4000 ft. in the mountains, and occurring as a small, much-branched thorny bush. The small flowers are white or tinged with pink

on the outside; the fruit is small and generally round, with a thin, light green or lemon-yellow bitter rind, and a very sour, somewhat bitter juicy pulp. It is extensively cultivated throughout the West Indies, especially in Dominica, Montserrat and Jamaica, the approximate annual value of the exports from these islands being respectively £45,000, £6000 and £6000. The plants are grown from seed in nurseries and planted out about 200 to the acre. They begin to bear from about the third year, but full crops are not produced until the trees are six or seven years old. The ripe yellow fruit is gathered as it falls. The fruit is bruised by hand in a funnel-shaped vessel known as an écuelle, with a hollow stem; by rolling the fruit on a number of points on the side of the funnel the oil cells in the rind are broken and the oil collected in the hollow stem—this is the essential oil or essence of limes. The fruits are then taken to the mill, sorted, washed and passed through rollers and exposed to two squeezings. Two-thirds of the juice is expressed by the first squeezing, is strained at once, done up in puncheons and exported as raw juice. The product of the second squeezing, together with the juice extracted by a subsequent squeezing in a press, is strained and evaporated down to make concentrated juice; ten gallons of the raw juice yield one gallon of the concentrated juice. The raw juice is used for preparations of lime juice cordial, the concentrated for manufactures of citric acid.

On some estates citrate of lime is now manufactured in place of concentrated acid. Distilled oil of limes is prepared by distilling the juice but this is only done in Dominica and Trinidad. It is obtained by hand as described above. Green limes and pickled limes preserved in brine are largely exported to the United States, and more recently green limes have been exported to the United Kingdom. Lime marmalade is preserved as a substitute for marmalade. A spinedess form of the lime appeared as a sport in Dominica in 1892, and is now grown there and elsewhere on a commercial scale. A form with seedless fruits has also recently been discovered in Dominica, and in Trinidad independently. The young leaves of the lime are used for perfuming the water in finger-glasses, a few being placed in the water and bruised before use.

LEMONNIER, ANTOINE LOUIS CAMILLE (1844—), Belgian poet, was born at Ixelles, Brussels, on the 24th of March 1844. He studied law, and then took a clerkship in a government office, which he resigned after three years. Lemonnier inherited Flemish blood from both parents, and with it the animal force and pictorial energy of the Flemish temperament. He published a Salon de Bruxelles in 1864, and again in 1866. His early friendships were chiefly with artists; and he wrote art criticisms with recognized discernment. Taking a house in the hills near Namur, he devoted himself to sport, and developed the intimate sympathy with nature which informs his best work. Now (1869) he is a formalist. In 1880 he published a pamphlet pleading the cause of France, and full of the author's horror of war, had a great success. His capacity as a novelist, in the fresh, humorous description of peasant life, was revealed in Un Coin de village (1879). In Un Mâle (1881) he achieved a different kind of success. It deals with the amours of a poacher and a farmer's daughter, with the forest as a background. Cachaprz, the poacher, seems the very embodiment of the wild life around him. The rejection of Un Mâle by the judges for the quinquennial prize of literature in 1883 made Lemonnier the centre of a school, inaugurated at a banquet given in his honour on the 27th of May 1883. Le Mort (1882), which describes the remorse of two peasants for a murder they have committed, is a masterpiece in its vivid representation of terror. It was remodelled as a tragedy in five acts (Paris, 1899) by its author. Ceux de la gibie (1889), dedicated to "the children of the soil," was written in 1885. He turned as usual to local subjects for some time to produce a series of psychological novels, books of art criticism, &c., of considerable value, but assimilating more closely to French contemporary literature. The most striking of his later novels are: L'Hystérique (1885); Hoppé-chœur (1886), often compared with Zola's Germinal; Le Pessédé (1890); La Fin des bourgeois (1892); L'Arche, journal d'une maman (1894), a quiet book, quite different from his usual work; La Faute de Mme Charvet (1895); L'Homme en amour (1897); and, with a return to Flemish subjects, Le Vent dans les moulins (1901); Petit Homme de Dieu (1902), and Comme va le ruisseau (1903). In 1888 Lemonnier was prosecuted in Paris for offending against public morals by a story in Gil Bias, and was condemned to a fine. In a later prosecution at Brussels he was defended by Edmond Picard, and acquitted; and he was arraigned for a third time, at Bruges, for his Homme en amour, but again
acquitted. He represents his own case in *Les Deux consciences* (1902). *L'Ile vierge* (1897) was the first of a trilogy to be called *La Légende de la vie*, which was to trace, under the fortunes of the hero, the pilgrimage of man through sorrow and sacrifice to the conception of the divinity within him. In *Adam et Eve* (1899), and *Au Cœur frais de la forêt* (1900), he preached the return to nature as the salvation not only of the individual but of the community. Among his other more important works are *G. Courbet, et ses œuvres* (1878); *L'histoire des Beaux-Arts en Belgique 1830-1887* (1887); *En Allemagne* (1888), dealing especially with the Pinakothek at Munich; *La Belgique* (1888), an elaborate descriptive work with many illustrations; *La Vie belge* (1905); and *Alfred Stevens et son œuvre* (1906).

Lemonnier spent much time in Paris, and was one of the early contributors to the *Mercure de France*. He began to write at a time when Belgian letters lacked style; and with such toil, and some initial extravagances, he created a medium for the expression of his ideas. He explained something of the process in a preface contributed to Gustave Abel's *Labour de la proce* (1902). His prose is magnificent and sonorous, but abounds in neologisms and strange metaphors.

See the *Revue de Belgique* (15th February 1903), which contains the syllabus of a series of lectures on Lemonnier by Edmond Picard, a bibliography of his works, and appreciations by various writers.

**LEMONNIER, PIERRE CHARLES** (1715-1790), French astronomer, was born on the 23rd of November 1715 in Paris, where his father was professor of philosophy at the collège d'Harcourt. His first recorded observation was made before he was sixteen, and the presentation of an elaborate lunar map procured for him admission to the Academy, on the 21st of April 1736, at the early age of twenty. He was chosen in the same year to accompany P. L. Maupertuis and Alexis Clairault on their geodetical expedition to Lapland. In 1738, shortly after his return, he explained, in a memoir read before the Academy, the advantages of J. Flamsteed's mode of determining right ascensions. His persistent recommendation, in fact, of English methods and instruments contributed effectively to the reformation of French practical astronomy, and constituted the most eminent of his services to science. He corresponded with J. Bradley, was the first to represent the effects of nutation in the motion of the moon, and introduced, in 1741, the use of the transit-instrument at the Paris observatory. He visited England in 1748, and, in company with the earl of Morton and James Short the optician, continued his journey to Scotland, where he observed the annular eclipse of July 25. The liberality of Louis XV., in whose favour he stood high, furnished him with the means of procuring the best instruments, many of them by English makers. Amongst the fruits of his industry may be mentioned a laborious investigation of the disturbances of Jupiter by Saturn, the results of which were employed and confirmed by L. Euler in his prize essay of 1748; a series of lunar observations extending over fifty years; some interesting researches in terrestrial magnetism and atmospheric electricity, in the latter of which he detected a regular diurnal period; and the determination of the places of a great number of stars, including twelve separate observations of Uranus, between 1765 and its discovery as a planet. In his lectures at the collège de France he first publicly expounded the analytical theory of planets, and his timely patronage secured the services of J. J. Lalande for astronomy. His temper was irritable, and his hasty utterances exposed him to retorts which he did not readily forgive. Against Lalande, owing to some trifling pique, he closed his doors “during an entire revolution of the moon’s nodes.” His career was arrested by paralysis late in 1791, and a repetition of the stroke terminated his life. He died at Hérel near Bayeux on the 31st of May 1790.

By his marriage with Madeleine de Cussey he left three daughters, one of whom became the wife of J. L. Lagrange.

He was admitted in 1730 to the Royal Society, and was one of the one hundred and forty-four original members of the Institute.

He wrote *Histoire céleste* (1741); *Théorie des comètes* (1743), a translation, with additions of Halley’s *Synopsis Institutionum astronomaticarum* (1746), an improved translation of J. Keill’s text-book; *Nouveau zodiaque* (1755); *Observations de la lune, du soleil, et des étoiles fixes* (1751-1755); *Lois du magnétisme* (1757-1758), &c.

**LEMOYNE, JEAN BAPTISTE** (1704-1778), French sculptor, was the pupil of his father, Jean Louis Lemoyme, and of Robert le Lorrain. He was a great figure in his day, around whose modest and kindly personality there wagged opposing storms of denunciation and applause. Although his disregard of the classic tradition and of the essentials of dignified sculpture, as well as his lack of firmness and of intellectual grasp of the larger principles of his art, lay him open to stringent criticism, de Clarac’s charge that he had delivered a mortal blow at sculpture is altogether exaggerated. Lemoyn’s more important works have for the most part been destroyed or have disappeared. The equestrian statue of “Louis XV.” for the military school, and the composition of “Mignard’s daughter, Mme Feuquieres, kneeling before her father’s bust” (which bust was from the hand of Coysevox) were subjected to the violence by which Bouchardon’s equestrian monument of Louis XIV. (q.v.) was destroyed. The panels only have been preserved. In his busts evidence of his riotous and florid imagination to a great extent disappears, and we have a remarkable series of important portraits, of which those of women are perhaps the best. Among Lemoyn’s leading achievements in this class are “Fontenelle” (at Versailles), “Voltaire”, “Latour” (all of 1748), “Duc de la Vallière” (Versailles), “Comte de St Florentin”, and “Créblion” (Dijon Museum); “Mlle Chiron” and “Mlle Dangerville”, both produced in 1761 and both at the Théâtre Français in Paris, and “Mme de Pompadour,” the work of the same year. Of the Pompadour he also executed a statue in the costume of a nymph, very delicate and playful in its air of grace. Lemoyn was perhaps most successful in his training of pupils, one of the leaders of whom was Falconnet.

**LEMPRIÈRE, JOHN** (c. 1755-1824), English classical scholar, was born in Jersey, and educated at Winchester and Pembroke College, Oxford. He is chiefly known for his *Bibliotheca Classica* or Classical Dictionary (1788), which, edited by various later scholars, long remained a readable if not very trustworthy reference book in mythology and classical history. In 1792, after holding other scholarly posts, he was appointed to the head-mastership of Abingdon grammar school, and later became the vicar of that parish. While occupying this living, he published a Universal Biography of Eminent Persons in all Ages and Countries (1808). In 1809 he succeeded to the head-mastership of Exeter free grammar school. On retiring from this, in consequence of a disagreement with the trustees, he was given the living at Meeth in Devonshire, which, together with that of Newton Petrock, he held till his death in London on the 1st of February 1824.
and nearly similar form; the function of the canine being discharged by the first premolar, which is larger than the other teeth of the same series. With the exception of the second toe of the hind-foot, the digits have well-formed, flattened nails as in the majority of monkeys. In the members of the typical genus *Lemur*, as well as in the allied *Hapalemur* and *Lepilemur*, none of the toes or fingers are connected by webs, and all have the hind-limbs of moderate length, and the tail long. The maximum number of teeth is 36, there being typically two pairs of incisors and three of premolars in each jaw. In habits some of the species are nocturnal and others diurnal; but all subsist on a mixed diet, which includes birds, reptiles, eggs, insects and fruits. Most are arboreal, but the ring-tailed lemur (*L. catta*) often dwells among rocks. The species of the genus *Lemur* are diurnal, and may be recognized by the length of the muzzle, and the large tufted ears. In some cases, as in the black lemur (*L. macaco*) the two sexes are differently coloured; but in others, especially the ruffed lemur (*L. variegatus*), there is much individual variation in this respect, scarcely any two being alike. The gentle lemmurs (*Hapalemur*) have a rounder head, with smaller ears and a shorter muzzle, and also a bare patch covered with spinous on the fore-arm. The sportive lemurs (*Lepilemur*) are smaller than the typical species of *Lemur*, and the adults generally lose their upper incisors. The head is short and conical, the ears large, round and mostly bare, and the tail shorter than the body. Like the gentle lemmurs they are nocturnal. (See Avahi, Ave-Ave, Galago, InDrI, Loris, Potto, Sifaka and Tarsier.) (R.L.*).

**LENA**, a river of Siberia, rising in the Baikal Mountains, on the W. side of Lake Baikal, in 54° 10’ N. and 105° 55’ E. Wheeling round by the S., it describes a semicircle, then flows N.N.E. and N.E., being joined by the Kirenga and the Vitim, both from the right; from 115° E. it flows E.N.E. as far as Yakutsk (65° N., 137° 40’ E.), where it enters the lowlands, after being joined by the Olekma, also from the right. From Yakutsk it goes N. until joined by its right-hand affluent the Aldan, which deflects it to the north-west; then, after receiving its most important left-hand tributary, the Viluy, it makes its way nearly due N. to the Nordenskjold Sea, a division of the Arctic, disemboguing S.W. of the New Siberian Islands by a delta 10,800 sq. m. in area, and traversed by seven principal branches, the most important being Bylou, farthest east. The total length of the river is estimated at 2860 m. The delta arms sometimes remain blocked with ice the whole year round. At Yakutsk navigation is generally practicable from the middle of May to the end of October, and at Kirensk, at the confluence of the Lena and the Kirenga, from the beginning of May to about the same time. Between these two towns there is during the season regular steamboat communication. The area of the river basin is calculated at 805,500 sq. m. Gold is washed out of the sands of the Vitim and the Olekma, and tusks of the mammoth are dug out of the delta.

See G. W. Melville, *In the Lena Delta* (1885).

**LE NAIN**, the name of three brothers, LOUIS, ANTOINE and MATHIEUX, who occupy a peculiar position in the history of French art. Although they figure amongst the original members of the French Academy, their works show no trace of the influences which prevailed when that body was founded. Their sober execution and choice of colour recall characteristics of the Spanish school, and when the world of Paris was busy with mythological allegories, and the “heroic deeds” of the king, the three Le Nain devoted themselves chiefly to subjects of humble life such as “Boys Playing Cards,” “The Forge,” or “The Peasants’ Meal.” These three paintings are now in the Louvre; various others may be found in local collections, and some fine drawings may be seen in the British Museum; but the Le Nain signature is rare, and is never accompanied by any specification as to place or date of the work of the brothers. Their lives are lost in obscurity; all that can be affirmed is that they were born at Lion in Picardy towards the close of the 16th century. About 1629 they went to Paris; in 1648 the three brothers were received into the Academy, and in the same year both Antoine and Louis died. Mathieu lived on till August 1677; he bore the title of chevalier, and painted many portraits. Mary of Modica and Mazarin were amongst his sisters, but these works seem to have disappeared.

See Champsaur, *Essai sur la vie et l’œuvre de Le Nain* (1850), and *Catalogue des tableaux de Le Nain* (1861).

**LENAU, NIKOLAUS**, the pseudonym of Nikolaus Franz Niem von Streihlenau (1828–1892), Austrian poet, who was born at Csatád near Temesvar in Hungary, on the 15th of August 1822. His father, a government official, died at Budapest in 1827, leaving his children to the care of an affectionate, but jealous and somewhat hysterical, mother, who in 1811 married again. In 1810 the boy went to the university of Vienna; he subsequently studied Hungarian law at Pressburg and then spent the best part of four years in qualifying himself in medicine. But he was unable to settle down to any profession. He had early begun to write verses; and the disposition to sentimental poetry, as he called it, which had been initiated by his mother, stimulated by love disappointments and by the prevailing fashion of the romantic school of poetry, settled into gloom after his mother’s death in 1829. Soon afterwards a legacy from his grandmother enabled him to devote himself wholly to poetry. His first published poems appeared in 1827, in J. G. Seidl’s *Aurora*. In 1831 he went to Stuttgart, where he published a volume of *Gedichte* (1832) dedicated to the Swabian poet Gustav Schwab. Here he also made the acquaintance of Uhland, Justus Kerner, Karl Mayer1 and others; but his restless spirit longed for change, and he determined to seek for peace and freedom in America. In October 1832 he landed at Baltimore and settled on the home-stead in Ohio. But the reality of life in “the primaval forest” fell lamentably short of the ideal he had pictured; he disliked the Americans with their eternal “English isiping of dollars” (anglischcs Talergeld); and in 1833 he returned to Germany, where he published a second volume of poems before his death. From now on he lived partly in Stuttgart and partly in Vienna. In 1836 appeared his *Faust*, in which he laid bare his own soul to the world; in 1837, *Savonarola*, an epic in which freedom from political and intellectual tyranny is insisted upon as essential to Christianity. In 1838 appeared his *Neue Gedichte*, which prove that Savonarola had been but the result of a passing exaltation. Of these new poems, some of the finest were inspired by his hopeless passion for Sophie von Löwenthal, the wife of a friend, whose acquaintance he had made in 1833 and who “understood him as no other.” In 1842 appeared *Die Albigenser*, and in 1844 he began writing his *Don Juan*, a fragment of which was published after his death. Soon afterwards his never well-balanced mind began to show signs of aberration, and in October 1844 he was placed under restraint. He died in the asylum at Oberdöbling near Vienna on the 22nd of August 1850. LeNAU’s fame rests mainly upon his shorter poems; even his epics are essentially lyric in quality. He is the greatest modern lyric poet of Austria, and the typical representative in German literature of that pessimistic Weltschmerz which, beginning with Byron, reached its culmination in the poetry of Leopardi.

**LENABACH, FRANZ VON** (1836–1904), German painter, was born at Schrobenhausen, in Bavaria, on the 13th of December 1836. His father was a mason, and the boy was intended to follow his father’s trade or be a builder. With this view he was sent to school at Landsberg, and then to the polytechnic at Augsburg. But after seeing Hofner, the animal painter, executing 1 Karl Friedrich Hartmann Mayer (1786–1870), poet, and biographer of Uhland, was by profession a lawyer and government official in Württemberg.
ing some studies, he made various attempts at painting, which his father's orders interrupted. However, when he had seen the galleries of Augsburg and Munich, he finally obtained his father's permission to become an artist, and worked for a short time in the studio of Grüfle, the painter; after this he devoted much time to copying. Thus he was already accomplished in technique when he became the pupil of Piloty, with whom he set out for Italy in 1838. A few interesting works remain as the outcome of this first journey—"A Peasant seeking Shelter from Bad Weather" (1835), "The Goat herd" (1830, in the Schack Gallery, Munich), and "The Arch of Titus" (in the Palfy collection, Budapest). On returning to Munich, he was at once called to Weimar to take the appointment of professor at the Academy. But he did not hold it long, having made the acquaintance of Count Schack, who commissioned a great number of copies for his collection. Lenbach returned to Italy the same year, and there copied many famous pictures. He set out in 1867 for Spain, where he copied not only the famous pictures by Velasquez in the Prado, but also some landscapes in the museums of Granada and the Alhambra (1868). In the previous year he had exhibited at the great exhibition at Paris several portraits, one of which took a third-class medal. Thereafter he exhibited frequently both at Munich and at Vienna, and in 1900 at the Paris exhibition was awarded a Grand Prix for painting. Lenbach, who died in 1904, painted many of the most remarkable personages of his time.

See Berlepsch, "Lenbach," "Veihe und Klosterg Monatshfte (1891); Bégoué, Les Portraits de Lenbach à l'exposition de Munich (1899); K. Knackfuss, Lenbach, and Franz von Lenbach Bildnisse (1900).

LENFANT, JACQUES (1661-1728), French Protestant divine, was born at Bazvoie in La Beauce on the 13th of April 1661, son of Paul Lenfant, Protestant pastor at Bazvoie and afterwards at Châtillon-sur-Loing until the revocation of the edict of Nantes, when he removed to Cassel. After studying at Saumur and Geneva, Lenfant became a theologian in Heidelberg. In 1684 he was ordained minister of the French Protestant church, and appointed chaplain to the dowager electress panthea. When the French invaded the Palatinate in 1688 Lenfant withdrew to Berlin, as in a recent book he had vigorously attacked the Jesuits. Here in 1689 he was again appointed one of the ministers of the French Protestant church; this office he continued to hold until his death, ultimately adding to it that of chaplain to the king, with the dignity of Consistorialbath. He visited Holland and England in 1707, preached before Queen Anne, and, it is said, was invited to become one of her chaplains. He was the author of many works, chiefly on church history. In search of materials he visited Helmländt in 1712, and Leipzig in 1715 and 1725. He died at Berlin on the 7th of August 1728.

An exhaustive catalogue of his publications, thirty-two in all, was published in J. G. de Chauffeep's Dictionnaire. See also E. and S. Haag's France Protestante. He is now best known by his Histoire du concile de Constance (Amsterdam, 1714; 2nd ed., 1728; English trans., 1750). It is of course largely dependent upon the labors of W. von der Hardt (1660-1726), but has literary merits peculiar to itself, and has been praised on all sides for its fairness. It was followed by Histoire du concile de Pise (1724), and (posthumously) by Histoire de la guerre des Huitilles et du siège de Basle (Amsterdam, 1731; German translation, Vienna, 1783-1784). Lenfant was one of the chief promoters of the Biblio-thèque Germanique, begun in 1720; and he was associated with Isaac Beausobre (1669-1738) in the preparation of the new French translation of the New Testament with original notes, published at Amsterdam in 1746.

LENKORAN, a town in Russian Transcaucasia, in the government of Baku, stands on the Caspian Sea, at the mouth of a small stream of its own name, and close to a large lagoon. The lighthouse stands in 38° 45' 38" N. and 48° 50' 18" E. Taken by storm on New Year's day 1813 by the Russians, Lenkoran was in the same year formally surrendered by Persia to Russia by the treaty of Gulistain, along with the khanate of Talsch, of which it was the capital. Pop. (1867) 15,933, (1897) 8768. The fort has been dismantled; and in trade the town is outstripped by Astara, the customs station on the Persian frontier.

The District of Lenkoran (2117 sq. m.) is a thickly wooded mountainous region, shut off from the Persian plateau by the Talsch range (7000-8000 ft. high), and with a narrow marshy strip along the coast. The climate is exceptionally moist and warm (annual rainfall 52-79 in.; mean temperature in summer 75° F., in winter 40°), and fosters the growth of many Indian species of vegetation. The iron tree (Parrotia persica), the silk acacia, Carpinus betulus, Quercus iberica, the box tree and the walnut flourish freely, as well as the sumach, the pomegranate, and the Wild Peach. The Morich Tree is not unfrequently met with, and wild boars are abundant. Of the 131,361 inhabitants in 1897 the Talyshes (35,000) form the aboriginal element, belonging to the Iranian family, and speaking an unambiguously developed language closely related to Persian. They are of middle height and dark complexion, with generally straight nose, small round skull, small sharp chin and large full eyes, which are expressive, however, rather of cunning than intelligence. They live exclusively on rice. In the northern half of the district the Tatar element predominates (40,000) and there are a number of villages occupied by Russian Raskolniks (Nonconformists). Agriculture, bee-keeping, silk worm-rearing and fishing are the principal occupations.

LENNEP, JACQUES VAN (1802-1868), Dutch poet and novelist, was born on the 24th of March 1802 at Amsterdam, where his father, David Jacob van Lennepe (1774-1853), a scholar and
poet, was professor of eloquence and the classical languages in the Athenaeum. Lennef took the degree of doctor of laws at Leiden, and then settled as an advocate in Amsterdam. His first poetical efforts had been translations from Byron, of whom he was an ardent admirer, and in 1826 he published a collection of original Academische Idylle, which had some success. He first attained genuine popularity by the Nederlandsche Legenden (2 vols., 1828) which reproduced, after the manner of Sir Walter Scott, some of the more stirring incidents in the early history of his fatherland. His fame was further raised by his patriotic songs at the time of the Belgian revolt, and by his comedies Het Dorp aan de Grezen (1830) and Het Dorp over de Grezen (1831), which also had reference to the political events of 1830.

In 1833 he broke new ground with the publication of De Plegesoon (The Adopted Son), the first of a series of historical romances in prose, which have acquired for him in Holland a position somewhat analogous to that of Sir Walter Scott in Great Britain. The series included De Roos van Dekama (2 vols., 1836), Onze Voorouders (5 vols., 1838), De Logegallen van Pernsand Haucyk (2 vols., 1840), Elisabeth Musk (3 vols., 1845), and De Logegallen van Klaasje Zeenen (5 vols., 1865), several of which have been translated into German and French, and two—The Rose of Dekama (1847) and The Adopted Son (New York, 1847)—into English. His Dutch history for young people (Voornaamste Geschiedenissen van Noord-Nederland aan mijne Kinderen verhaald, 4 vols., 1845) is attractively written. Apart from the two comedies already mentioned, Lennef was an indefatigable journalist and literary critic, the author of numerous dramatic pieces, and of an excellent edition of Vondel's works.

For some years Lennef held a judicial appointment, and from 1853 to 1856 he was a member of the second chamber, in which he voted with the conservative party. He died at Oosterbeek near Arnhem on the 25th of August 1868.

There is a collective edition of his Poetische Werken (15 vols., 1859-1872), and also of his Romanistische Werken (23 vols., 1855-1866). See also a bibliography by P. Knoll (1866); and Jan ten Brink, Geschiedenis der Noord-Nederlandsche Letteren in de XIXe Eeuw (No. iii.).

LENNEF, a town of Germany, in the Prussian Rhine province, 18 m. E. of Düsseldorf, and 9 m. S. of Barmen by rail, at a height of 1000 ft. above the level of the sea. Pop. (1905) 10,323. It lies in the heart of one of the busiest industrial districts in Germany, and carries on important manufactures of the finer kinds of cloth, wool, yarn and felt, and also of iron and steel goods. It has an Evangelical and a Protestant church, a modern school and a well-equipped hospital. Lennef, which was the residence of the counts of Berg from 1226 to 1300, owes the foundation of its prosperity to an influx of Cologne weavers during the 14th century.

LENNEX, a name given to a large district in Dumbartonshire and Stirlingshire, which was erected into an earldom in the latter half of the 11th century. It embraced the ancient sheriffdom of Dumbarton and nineteen parishes with the whole of the lands round Loch Lomond, formerly Loch Leven, and the river of that name which glides into the estuary of the Clyde at the ancient castle of Dumbarton.

On this river Leven, at Balloch, was the seat of Alwin, first earl of Lennox. It is probable that he was of Celtic descent, but the records are silent as to his part in history; that he was earl at all is only proved from the charters of his son, another Alwin, and he died some time before 1217. The second Alwin was father of ten sons, one of whom founded the clan Macfarlane, famous in the annals of the district, while another was ancestor of Walter of Farlane, who married the heiress of the 6th earl of Lennox. Malduen, the 3rd earl, eldest of the sons of Alwin the younger, is an historical personage; he was a witness to the treaty between Alexander II., king of Scotland, and his brother-in-law the English king Henry III., at Newcastle in 1237, concerning the much disputed northern counties of England. His grandson, Malcolm, successor to the title, swore fealty to Edward I. in 1306; it was apparently his son, another Malcolm, the 5th earl, who was summoned by Edward to parliament and entrusted with the important post of guarding the fords of the river Forth. But the 5th earl soon after gave his services to the party of Bruce, the cause of that family having been embraced by his father as early as 1292. As a result the English king bestowed the earldom on Sir John Menteith, who was holding it in 1307 while the real earl was with King Robert Bruce in his wanderings in the Lennox country. For his services he was rewarded with a renewal of the earldom and the keeping of Dumbarton Castle; he fell fighting for his country at Halidon Hill in 1333. His son Donald, the 6th earl, an adherent of King David II., left a daughter, Margaret, countess of Lennox, who was married to her kinsman the above-mentioned Walter of Farlane, nearest heir male of the Lennox family.

In 1329, on the marriage of their grand-daughter Isabella, eldest daughter of Duncan, 8th earl, with Sir Murdoch Stewart, afterwards duke of Albany, the earldom was resigned into the hands of the king, who re-granted it to Earl Duncan, with remainder to the heirs male of his body, with remainder to Murdoch and Isabella and the heirs of their bodies begotten between them, with eventual remainder to Earl Duncan's nearest and lawful heirs. In 1444, when Murdoch, then duke of Albany, was succeeded in raising the poet king James I. from his long English captivity, the title of Lennox was taken by the Scottish party to Durham. The next year, however, by a deed of James of Albany, being executed perhaps for no other reason than that he was his father-in-law. The earldom was forfeited, and the widowed duchess of Albany, now also countess of Lennox, lived secure in her island castle of Inchmurrin on Loch Lomond until her death. Of her four sons, none of whom left legitimate issue, the eldest died in 1421, the two next suffered their father's fate at Stirling, while the youngest had to flee for his life to Ireland. Her daughter Isobel appears to have been the wife of Sir Walter Buchanan of that ilk.

It was from Elizabeth, sister of the countess, that the next holders of the title descended. She was married to Sir John Stewart of Darnley (distinguished in the military history of France as seigneur d'Aubigny), whose immediate ancestor was brother of James, 5th high steward of Scotland. Their grandson, another Sir John Stewart, created a lord of parliament as Lord Darnley, was served heir to his great-grandfather Duncan, earl of Lennox, in 1474, and was designated as earl of Lennox in a charter under the great seal in the same year. He thereafter followed disputes with John of Haldane, whose wife's great-grandmother had been another of the three daughters of Duncan, 8th earl of Lennox, and in her right he contested the succession. Lord Darnley, however, appears to have silenced all opposition and for the last seven years of his life maintained his right to the earldom undisputed. Three of his younger sons were greatly distinguished in the French service, one being captain of Scotsmen-at-arms, another premier homme d'armes, and a third maréchal de France.

Their elder brother Matthew, 2nd earl of this line, fell on Flodden Field, leaving by his wife Elizabeth, daughter of James, earl of Arran, and niece of James III., a son and successor John, who became one of the guardians of James V. and was murdered in 1526. His son Matthew, the 4th earl, played a great part in the intrigues of his time, and by his marriage with Margaret Douglas allied himself to the royal house of England as well as strengthening the ties which bound his family to that of Scotland; because Margaret was the daughter and heiress of the 6th earl of Angus by his wife, Margaret Tudor, sister of King Henry VIII., and widow of King James IV. Though his estates were forfeited in 1545, Earl Matthew in 1564 not only had them restored but had the satisfaction of getting his eldest son Henry married to Mary, queen of Scots. The murder of Lord Darnley, now created earl of Rosse, lord of Ardmunoch and duke of Albany, took place in February 1567, and in July his only son James, by Mary's abdication, became king of Scotland. The old earl of Lennox, now grandfather of his sovereign, obtained the regency in 1570, but in the next year was killed, in the attack made on the parliament at Stirling, being the third earl in succession to meet with a violent death.

The title was now merged in the crown in the person of
James VI. the next heir, but was soon after granted to the king's uncle Charles, who died in 1576, leaving an only child, the unfortunate Lady Arabella Stewart.

Two years later the title was granted to Robert Stewart, the king's grand-uncle, second son of John, the 3rd earl, but he in 1580 exchanged it for that of earl of March. On the same day the earldom of Lennox was given to Esme Stewart, first cousin of the king and grandson of the 3rd earl, who being son of John Stewart (adopted heir of the maréchal d'Aubigny) and his French wife, Anne de la Queulle. In the following year Esme was created duke of Lennox, earl of Darnley, Lord Aubigny, Tarbottan and Dalkeith, and other favours were heaped upon him, but the earl of Ruthven sent him back to France where he died soon after. His elder son, Ludovic, was thereupon summoned to Scotland by James, who invested him with all his father's honours and estates, and after his accession to the English throne created him Lord Settrington and earl of Richmond (1613), and earl of Newcastle-upon-Tyne and duke of Richmond (1623), all these titles being in the peerage of England. After holding many appointments the 2nd duke died without issue in 1624, being succeeded in his Scottish titles by his brother Esme, who had already been created earl of March and Lord Clifton of Leighton Bromswold in the peerage of England (1619) and was seigneur d'Aubigny in France. Of his sons, Henry succeeded to Aubigny, and died young at Venice; Ludovic, seigneur d'Aubigny, entered the Roman Catholic Church and received a cardinal's hat just before his death; while the three other younger sons, George, seigneur d'Aubigny, John and Bernard, were all distinguished as royalists in the Civil War. Each met a soldier's death. George at Edgehill, John at Alresford and Bernard at Rowton Heath. James, the eldest son and 4th duke of Lennox, was created duke of Richmond in 1641, being like his brother a devoted adherent of Charles I.

With the death of his little son Esme, the 5th duke, in 1660, the titles, including that of Richmond, passed to his first cousin Charles, who had already been created Lord Stuart of Newbury and earl of Lichfield, being likewise now seigneur d'Aubigny, Disliked by Charles II., principally because of his marriage with "la belle Stuart"—"the noblest romance and example of a brave lady that ever I read in my life," writes Pepys—he was sent into exile as ambassador to Denmark, where he was drowned in 1672. His wife had had the Lennox estates granted to her for life, but his only sister Katharine, wife of Henry O'Brien, heir apparent of the 7th earl of Thomond, was served heir to him. Her only daughter, the countess of Clarendon, was mother of Theodosia Hyde, ancestress of the present earls of Darnley.

The Lennox duchedom, being to heirs male, now devolved upon Charles II., who bestowed it with the titles of earl of Darnley and Lord Tarbolton upon one of his bastards, Charles Lennox, son of the celebrated duchess of Portsmouth, he having previously been created duke of Richmond, earl of March and Lord Settrington in the peerage of England. The ancient lands of the Lennox title were also granted to him, but these he sold to the duke of Montrose.

His son Charles, who inherited his grandmother's French dukedom of Aubigny, was a soldier of distinction, as were the 3rd and 4th dukes. The wife of the last, Lady Charlotte Gordon, as heir of her brother brought the ancient estates of her family to the Lennoxes; the additional name of Gordon being taken by the 5th duke of Richmond and of Lennox on the death of his uncle, the 5th duke of Gordon. In the next generation further honours were granted to the family in the person of the 6th duke, who was rewarded for his great public services with the titles of duke of Gordon and earl of Kinrara in the peerage of the United Kingdom (1876).

See Scots Peerage, vol. v., for excellent accounts of these peerages by the Rev. John Anderson, curator Historical Dept. H.M. Register House; A. Francis Stewart and Francis J. Grant, Rotheay Herald. See also The Lennox by William Fraser.

LENNOX, CHARLOTTE (1780-1804). British writer, daughter of Colonel James Ramsay, lieutenant-governor of New York, was born in 1780. She went to London in 1735, and, being left unprovided for at her father's death, she began to earn her living by writing. She made some unsuccessful appearances at the stage and married in 1748. Samuel Johnson had an exaggerated admiration for her. "Three such women," he said, speaking of Elizabeth Carter, Hannah More and Fanny Burney, "are not to be found; I know not where to find a fourth, except Mrs Lennox, who is superior to them all." Her chief works are: The Female Quixote; or the Adventures of Arabella (1752), a novel; Shakespeare illustrated; or the novels and histories on which the plays . . . are founded (1753-1754), in which she argued that Shakespeare had spoiled the stories he borrowed for his plots by interpolating unnecessary intrigues and incidents; The Life of Harriot Stuart (1751), a novel; and The Sister, a comedy produced at Covent Garden (18th February 1760). This last was withdrawn after the first night, after a stormy reception, due, said Goldsmith, to the fact that its author had abused Shakespeare.

LENNOX, MARGARET, Countess of (1531-1578), daughter of Archibald Douglas, 6th earl of Angus, and Margaret Tudor, daughter of Henry VII. of England and widow of James IV. of Scotland, was born at Harbottle Castle, Northumberland, on the 6th of October 1515. On account of her nearness to the English crown, Lady Margaret Douglas was brought up chiefly at the English court in close association with the Princess Mary, who was practically her first friend throughout life. She was high in Henry VIII.'s favour, but was twice disgraced; first for an attachment to Lord Thomas Howard, who died in the Tower in 1537, and again in 1541 for a similar affair with Sir Charles Howard, brother of Queen Catherine Howard. In 1544 she married a Scottish exile, Matthew Stewart, 4th earl of Lennox (1516-1571), who was regent of Scotland in 1570-1571. During Mary's reign the countess of Lennox had rooms in Westminster Palace; but on Elizabeth's accession she removed to Yorkshire, where her home at Temple Newsam became a centre for Catholic intrigue. By a series of successful manoeuvres she married her son Henry Stewart, Lord Darnley, to Mary, queen of Scots. In 1566 she was sent to the Tower, but after the murder of Darnley in 1567 she was released. She was at last in dread in her denunciations of Mary, but was eventually reconciled with her daughter-in-law. In 1574 she again aroused Elizabeth's anger by the marriage of her son Charles, earl of Lennox, with Elizabeth Cavendish, daughter of the earl of Shrewsbury. She was sent to the Tower with Lady Shrewsbury, and was only pardoned after her son's death in 1577. Her diplomacy largely contributed to the future succession of her grandson James to the English throne. She died in December 1578.

The famous Lennox jemel, made for Lady Lennox as a memento of her husband, was bought by Queen Victoria in 1842.

LENO, DAN, the stage-name of George Galvin (1861-1904), English comedian, who was born at Somers Town, London, in February 1861. His parents were actors, known as Mr and Mrs Johnny Wilde. Dan Leno was trained to be an acrobat, but soon became a dancer, travelling with his brother as "the brothers Leno," and winning the world's championship in clog-dancing at Leeds in 1880. Shortly afterwards he appeared in London, and on the Oxford, and in 1886-1887 at the Surrey Theatre. In 1888-1889 he was engaged by Sir Augustus Harris to play the Baroness in the Babes in the Wood, and from that time he was a principal figure in the Drury Lane pantomimes. He was the wittiest and most popular comedian of his day, and delighted London music-hall audiences by his shop-walker, stores-proprietor, waiter, doctor, beef-eater, bathing attendant, "Mrs Kelly," and other impersonations. In 1900 he engaged to give his entire services to the Pavilion Music Hall, where he received £100 per week. In November 1901 he was summoned to Sandringham to do a "turn " before the king, and was proud from that time to call himself the "king's jester." Dan Leno's generosity endeared him to his profession, and he was the object of much sympathy during the brain failure which recurred during the last eighteen months of his life. He died on the 31st of October 1904.
LENORMANT, FRANÇOIS (1837–1883), French Assyriologist and archaeologist, was born in Paris on the 17th of January 1837. His father, Charles Lenormant, distinguished as an archaeologist, numismatist and Egyptologist, was anxious that his son should follow in his steps. He made him begin Greek at the age of six, and the child responded so well to this precocious scheme of instruction, that when he was only fourteen an essay of his, on the Greek tablets found at Memphis, appeared in the Revue archéologique. In 1856 he won the numismatic prize of the Académie des Inscriptions with an essay entitled Classification des monnaies des Lagides. In 1862 he became sub-librarian of the Institute. In 1859 he accompanied his father on a journey of exploration to Greece, during which Charles Lenormant succumbed to fever at Athens (24th November). Lenormant returned to Greece three times during the next six years, and gave up all the time he could spare from his official work to archaeological research. These peaceful labours were rudely interrupted by the war of 1870, when Lenormant served with the army and was wounded in the siege of Paris. In 1874 he was appointed professor of archaeology at the National Library, and in the following year he collaborated with Baron de Witte in founding the Gazette archéologique. As early as 1867 he had turned his attention to Assyrian studies; he was among the first to recognize in the cuneiform inscriptions the existence of a non-Semitic language, now known as Assyrian. Lenormant's knowledge was of encyclopaedic extent, ranging over an immense number of subjects, and at the same time thorough, though somewhat lacking perhaps in the strict accuracy of the modern school. Most of his varied studies were directed towards tracing the origins of the two great civilizations of the ancient world, which were to be sought in Mesopotamia and on the shores of the Mediterranean. He had a perfect passion for exploration. Besides his early expeditions to Greece, he visited the south of Italy; the time, with this object, was while traveling in Calabria that he met with an accident which ended fatally in Paris on the 9th of December 1883, after a long illness. The amount and variety of Lenormant's work is truly amazing when it is remembered that he died at the early age of forty-six. Probably the best known of his books are Les Origines de l'histoire d'après la Bible, and his ancient history of the East and account of Chaldæan magic. For breadth of view, combined with extraordinary sublety of intuition, he was probably unrivalled.

LENORNOX, a town of Berkshire county, Massachusetts, U.S.A. Pop. (1900) 2042; (1905) 3058; (1910) 3060. Area, 19-2 sq. m. The principal village, also named Lenox (or Lenox-on-the-Heights), lies about 2 m. W. of the Housatonic river, at an altitude of about 1000 ft., and about it are high hills—Yokum Seat (2080 ft.), South Mountain (1200 ft.), Bald Head (1583 ft.), and Rattlesnake Hill (1540 ft.). New Lenox and Lenoxdale are other villages in the township. Lenox is a fashionable summer and autumn resort, much frequented by wealthy people from Washington, Newport and New York. There are innumerable lovely walks and drives in the surrounding region, which contains some of the most beautiful country of the Berkshires—hills, lakes, charming intervelles and woods. As early as 1835 Lenox began to attract summer residents. In the next decade began the creation of large estates, although the great holdings of the present day, and the villas scattered over the hills, are comparatively recent features. The height of the season is in the autumn, when there are horse-shows, golf, tennis, hunts and other outdoor amusements. The Lenox library (1855) contained about 20,000 volumes in 1908. Lenox was settled about 1730, was included in Richmond township in 1765, and became an independent township in 1767. The names were those of Sir Charles Lenox, third duke of Richmond and Lenox (1735–1766), one of the staunch friends of the American colonies during the War of Independence. Lenox was the county-seat from 1787 to 1868. It has literary associations with Catherine M. Sedgwick (1789–1867), who passed here the second half of her life; with Nathaniel Hawthorne, whose brief residence here (1850–1851) was marked by the production of the House of the Seven Gables and the Wonder Book; with Fanny Kemble, a summer resident from 1826–1833; and with Henry Ward Beecher (see his Star Pogers). Elizabeth (Mrs Charles) Sedgwick, the sister-in-law of Catherine Sedgwick, maintained here from 1828 to 1864 a school for girls, in which Harriet Hosmer, the sculptor, and Maria S. Cummins (1827–1866), the novelist, were educated; and in Lenox academy (1803), a famous classical school (now a public high school) were educated W. L. Yancey, A. H. Stephens, Mark Hopkins and David Davis (1815–1886), a circuit judge of Illinois from 1848 to 1862, a justice (1862–1877) of the United States Supreme Court, a Republican member of the United States Senate from Illinois in 1877–1883, and president of the Senate from the 31st of October 1881, when he succeeded Chester A. Arthur, until the 3rd of March 1883. There is a statue commemorating General John Paterson (1744–1808) a soldier from Lenox in the War of Independence.

LENOS, a town of Northern France, in the department of Pas-de-Calais, 13 m. N.N.E. of Arras by rail on the Décule and on the Lens canal. Pop. (1906) 27,692. Lens has important iron and steel foundries, and engineering works and manufactories of steel cables, and occupies a central position in the coalfield of the department. Two and a half miles W.S.W. lies Liévin (pop. 22,070); likewise a centre of the coalfield. In 1648 the neighbourhood of Lens was the scene of a celebrated victory gained by Louis II. of Bourbon, prince of Condé, over the Spaniards.

LENS (from Lat. lens, lentil, on account of the similarity of the form of a lens to that of a lentil seed), in optics, an instrument which refracts the luminous rays proceeding from an object in such a manner as to produce an image of the object. It may be regarded as having four principal functions: (1) to produce an image larger than the object, as in the magnifying glass, microscope, &c.; (2) to produce an image smaller than the object, as in the ordinary photographic camera; (3) to convert rays proceeding from a point or other luminous source into a definite pencil, as in light-house lenses, the engraver's globe, &c.; (4) to collect luminous and heating rays into a smaller area, as in the burning glass. A lens made up of two or more lenses cemented together or very close to each other is termed "composite" or "compound"; several lenses arranged in succession at a distance from each other form a "system of lenses," and if the axes be collinear a "centred system." This article is concerned with the general theory of lenses, and more particularly with spherical lenses. For a special part of the theory of lenses see ABBERRATION; the instruments in which the lenses occur are treated under their own headings.

The most important type of lens is the spherical lens, which is a piece of transparent material bounded by two spherical surfaces, the boundary at the edge being usually cylindrical or conical. The line joining the centres, C, C, (Fig. 1), of the bounding surfaces is termed the axis; the points S, S, at

![Fig. 1](https://via.placeholder.com/150)

which the axis intersects the surfaces, are termed the "vertices" of the lens; and the distance between the vertices is termed the "thickness." If the edge be everywhere equidistant from the vertex, the lens is "centred."

Although light is really a wave motion in the aether, it is only necessary, in the investigation of the optical properties of systems of lenses, to trace the rectilinear path of the waves, i.e. the direction of the normal to the wave front, and this can be done.
by purely geometrical methods. It will be assumed that light, so long as it traverses the same medium, always travels in a straight line, and in following out the geometrical theory it will always be assumed that the light travels from left to right; accordingly all distances measured in this direction are positive, while those measured in the opposite direction are negative.

Theory of Optical Representation.—If a pencil of rays, i.e., the totality of the rays proceeding from a luminous point, falls on a lens or lens system, a section of the pencil, determined by the dimensions of the system, will be transmitted. The emergent rays will have directions differing from those of the incident rays, the alteration, however, being such that the transmitted rays are convergent in the "image-point," just as the incident rays diverge from the "object-point." Without each incident ray is associated an emergent ray, such pairs are termed "conjugate rays." Similarly we define an object-point and its image-point as "conjugate points"; all object-points lie in the "object-space," and all image-points lie in the "image-space."

The laws of optical representations were first deduced in their most general form by E. Abbe, who assumed (1) that an optical representation always exists, and (2) that to every point in the object-space there corresponds a point in the image-space, these points being mutually convertible by straight rays; in other words, with each object-point is associated one, and only one, image-point, and if the object-point be placed at the image-point, the conjugate points are known as a "conjugate point." We may therefore define an object-point to be a "conjugate point," since it transforms points into points and straight lines into straight lines. Prior to Abbe, however, James Clerk Maxwell published, in 1856, a geometrical theory of optical representation, but his methods were unknown to Abbe and to his pupils until O. Eppenstein drew attention to them. Although Maxwell's theory is not so general as Abbe's, it is used here since its methods permit a simple and convenient deduction of the laws.

Maxwell assumed that two object-points parallel to the axis are represented perpendicularly and similarly in two image-planes also perpendicular to the axis (by "sparily" is meant that the assumed ideal instrument unites all the rays proceeding from an object-point in one of the two planes in its image-point, the rays being generally transmitted by the system). The symmetry of the axis being assumed, it is sufficient to deduce laws for a plane containing the axis. In fig. 2 let O be an object-point, O' the image-point in which the perpendicular object-planes meet the axis; and since the axis corresponds to itself, the two conjugate points O', O2 are at the intersections of the two image-planes with the axis. We denote the four points by the letters O, O', O2, and O2'. If two points A, C be taken in the plane O2, whose images are A', C' in the plane O2', then the plane O2' of the object-space contains O2, O, A, C, and the plane O2 of the image-space must have O2'C', O2'A'. Since these planes are parallel, then A'C', O2'A' is the linear magnification of the plane O2. Similarly, if two points B, D be taken in the plane O2' and their images B', D' in the plane O2, we have B'O2A'O2 = B'D'O2D' (say), being the linear magnification of the plane O2. The areas of A and B and of C and D intersect in a point P, and the points of the conjugate points similarly determine the point P'.

If one takes the conjugate image-point of the object-point P, then the conjugate of every ray passing through P must pass through P'. To prove this, take a third line through P intersecting the planes O2, O2' in the points E, F, and by means of the magnifications B, B' we determine the conjugate points E', F' in the planes O2, O2'. Since the planes O2, O2' are parallel, then AC/EA' = BD/DF'; and since these planes are represented similarly in O2, O2', then AC/EA' = B'D'/BD'. This proportion is only possible when the straight line E'F' contains the point P'. Since P was any point whatever, it follows that every point of the object-space is represented in one and only one point in the image-space.

Take a second object-point P1, vertically under P and defined by the two rays CD, and EF; the conjugate point P1' will be determined by the intersection of the conjugate rays CD', and EF', the points D', F', being readily found from the magnifications B, B'. Since P1 is parallel to CE and also to EF, it follows that the points O1, O1' are simultaneously represented in O2, D'F' = D'F'; this is impossible unless P1', be parallel to CE. Therefore every perpendicular object-plane is represented by a perpendicular image-plane.

Let O be the intersection of the line PP', with the axis, and let O' be its conjugate; then it may be shown that a fixed conjugate B exists for the planes O and O'. For PP'/P'O = O1/O1', P'O' = O1'O1', and P' = B = O1'O1'O1'O1'. Eliminating PP', and P'O', we have P'P'/P'O = O1'O1'O1'O1', O1'O1'O1'O1' = B = O1'O1'O1'O1', i.e. B = O1'O1'.

The determination of the image-point of a given object-point is facilitated by means of another called "cardinal points" of the optical system. To determine the image-point O1' (fig. 3) corresponding to the object-point O1, we begin by choosing from the ray pencil proceeding from O1, the ray parallel with the axis, i.e. intersecting the axis at infinity, and the other ray parallel through O1 must intersect the axis after refraction (say at F'). Then F' is the image-point of an object-located at infinity on the axis, and is termed the "second principal focus" (German der objekt-geleitete Brennpunkt, the object-side focus). Similarly if O4' be on the parallel through O4 but in the image-space, then the conjugate ray must intersect the axis at a point (say F'), which is conjugate with the point at infinity on the axis in the image-space. This point is termed the principal focus "(German der objekt-geleitete Brennpunkt, the object-side focus.)"

Let H1, H1' be the intersections of the focal rays through F and F' with the line O1'O1'. These two points are in the position of object and conjugate, and the conjugate of the object-point H1 is termed the "second principal focus" (German der objekt-geleitete Brennpunkt, the object-side focus). Similarly if O4 be on the parallel through O4 but in the image-space, then the conjugate ray must intersect the axis at a point (say F'), which is conjugate with the point at infinity on the axis in the image-space. This point is termed the principal focus "(German der objekt-geleitete Brennpunkt, the object-side focus)."

Equations relating to the Focal Points.—We know that the ray proceeding from the object point O1, parallel to the axis and intersecting the principal plane H in H1, passes through H1' and F'.

![Fig. 3](http://www.image.com)
through the first principal focus F, and intersects the principal plane H in H'. Its conjugate ray passes through H' parallel to, and at the same distance from, the axis, and intersects the image-side focal plane in O'; this is the image of O, and y’ is its magnitude. From the figure we have \( h' = HH'/FH' \). By the equation (2) this was used by Gauss to define the focal length.

Referring to fig. 3, we have from the similarity of the triangles \( O'O'F \) and \( H'H'O' \), \( H'H' \). \( H'H'O'O' = FH'/FH, \) or \( O'O'/O'O' = FH/FH', \). Let \( x' \) be the focal distance O' of the object, and \( y' \) the object-side focal distance FH; then the above equation may be written \( y'/y = \beta \). From the similar triangles \( H'H'F \) and \( O'O'F' \), we obtain \( O'O'/O'O' = FH/FH' \). Let \( x' \) be the focal distance of the image F'O', and \( y' \) the image-side focal length \( FH'/FH' = x'/y' \). The ratio of the size of the image to the size of the object is termed the lateral magnification. Denoting this by \( \beta \), we have

\[
\beta = y'/y \equiv \beta = x'/x' \tag{1}
\]

and also

\[
x' = x' \tag{2}
\]

By differentiating equation (2) we obtain

\[
dx'/dy' = - (\beta x')/dy' \text{ or } dx'/dy' = - (\beta x'). \tag{3}
\]

The ratio of the displacement of the image dx' to the displacement of the object dx is the axial magnification, and is denoted by \( \gamma \).

Then \( \gamma = \tan u' \tan u \). Now tan \( u' = HH'/FH' = H'H'/F'H' = (F'H'-F'H) \). Also tan \( u = H'H/HH = H'H/F'H = HH'/F'H' \). Consequently \( \gamma = (FH/FH') = (F'H'/F'H') \). Hence, the image is in the same direction, either both in the direction of the light, or both in the opposite direction. This is shown in fig. 3 by the object O'O and the image O'O'.

If two conjugate rays are drawn from two conjugate points on the axis, making angles \( u \) and \( u' \) with the axis, as for example the rays \( OH, \) \( O'H' \), in fig. 3, \( u \) is termed the “angular aperture for the object”, and \( u' \) the “angular aperture for the image”. The ratio of the tangents of these angles is termed the “convergence” and is denoted by \( \gamma \), thus \( \gamma = \tan u' \tan u \). Now \( \tan u' = HH'/FH' = H'H'/F'H' = (F'H'-F'H) = (F'H'-F'H) \). Also tan \( u = H'H/HH = H'H/F'H = HH'/F'H' \). Consequently \( \gamma = (FH/FH') = (F'H'/F'H') \). Hence, the image is in the same direction, either both in the direction of the light, or both in the opposite direction. This is shown in fig. 3 by the object O'O and the image O'O'.

From equation (1) \( f = x'/x' \), we obtain by substituting unity from both sides \( (x-x')/x' = (x-x')/y' \), and consequently

\[
\int \frac{x-x}{x'} = \frac{x-x'}{y'} = \gamma. \tag{4}
\]

From equations (1), (3), and (4), it is seen that a simple relation exists between the lateral magnification, the axial magnification, and the convergence.

In addition to the four cardinal points \( F, H, F', H' \), J. B. Listing, “Beiträge aus physiologischen Optik,” Göttinger Studien (1845) introduced the so-called “nodal points” (Nodenspunkte) which are the two conjugate points from which the object and image appear the same size. In fig. 5 let K be the nodal point from which the object y appears under the same angle as the image y' from the other nodal point K'. Then \( O'O/KO \equiv O'O/KO' \), or \( O'O/FH' = FH'/FH' \), or \( O'O/FH' = FH'/FH' \). Calling the focal distances \( F'K' \) and \( F'K' \), \( X \) and \( X' \), we have \( x = \gamma (x-x') = \gamma (x-x') \), and since \( x'/y = \beta \), it follows that \( x = \gamma (x-x') \). Replace \( x ' \) and \( x ' \) by the values given in equation (2), and we obtain

\[
\frac{1}{X} = \beta \frac{X'}{X'} \text{ or } 1 = \beta X. \tag{5}
\]

Since \( \beta = f'/f, \) we have \( f = X, f = X \).

These equations show that to determine the nodal points, it is only necessary to measure the focal distance of the second principal focus from the first principal focus, and vice versa. In the special case when the initial and final medium is the same, as for example, a lens in air, we have \( f = -f' \), and the nodal points coincide with the principal points of the system; we then speak of the “nodal point property of the principal points”, meaning that the object and corresponding image subend the same angle at the principal points.

Equations Rotating to the Principal Points.—It is sometimes desirable to determine the distances of an object and its image, not from the focal points, but from the principal points. Let \( A \) (see fig. 3) be the principal point distance of the object and \( A' \) that of the image, we then have

\[
A = HO = FH + FO = FO - FH = x - f, \tag{5}
\]

\[
A' = HO' = FH' + FO' = FO' - FH' = x' - f', \tag{6}
\]

whence

\[
\frac{1}{A} = \frac{1}{x} \quad \frac{1}{A'} = \frac{1}{x'} \tag{7}
\]

Using \( xx' = ff' \), we have \( (A + f') (A' + f') = ff' \), which leads to \( AA' + A'f' = 0, \) or

\[
1 + \frac{f'}{A'} = \frac{1}{f} \tag{8}
\]

This becomes the special case when \( f = -f', \)

To express the linear magnification in terms of the principal point distances, we start with equation (4) \( f - x')/(f - y') = -f'/x' \), from this we obtain \( A/A' = -f'/x' \), or \( x' = -f'A/A' \); and by using equation (1), \( \gamma = \tan u' \tan u \).

In the special case of \( f = -f' \), this becomes \( \beta = A'/A = y'/y, \) from which it follows that the ratio of the dimensions of the object and image is equal to the ratio of the distances of the object and image from the principal points.

The convergence can be determined in terms of \( A \) and \( A' \) by substituting \( x = -f'A/A' \) in equation (4), when we obtain \( \gamma = A'/A'. \)

Composed Systems.—In discussing the laws relating to compound systems, we assume that the cardinal points of the component systems are known, and also that the combinations are centred, i.e. that the axes of the component lenses coincide. If some object is represented by two systems arranged one behind the other, we can regard the systems as co-operating in the formation of the final image.

Let such a system be represented in fig. 6. The two single systems are denoted by the suffixes 1 and 2; for example, \( F_1 \) is the first principal focus of the first, and \( F_2 \) the second principal focus of the second system. A ray parallel to the axis at a distance \( y \) passes through the second principal focus \( F_2 \) of the first system, intersecting the axis at an angle \( w' \). The point \( F_1 \) will be represented in the second system by the point \( F_1 \), which is therefore conjugate to the point at infinity for the entire system, i.e. it is the second principal focus of the compound system. The representation of \( F_1 \) in \( F_2 \) by the second system leads to the relations \( F_1 = F_1 \), and \( F_2 = F_2 = F_2 \), whence \( x = y = f' \). Denoting the distance between the adjacent focal planes \( F_1, F_2 \) by \( \Delta \), we have \( \Delta = F_1 F_2 = f_2 F_2 \), so that \( x' = (f_1 + f_2) \Delta \). A similar ray parallel to the axis at a distance \( y \) proceeding from the image-side will intersect the axis at the focal point \( F_1 \); and by finding the image of this point in the first system, we determine the first principal focus of the compound system.

Equation (2) gives \( x = y \), and since \( x' = x + \Delta \), we have \( x = f + f_2 \Delta \) as the distance of the first principal focus \( F_1 \) of the compound system from the first principal focus \( F_1 \) of the first system.

To determine the focal lengths \( f \) and \( f' \) of the compound system and the principal points \( H \) and \( H' \), we employ the equations defining the focal lengths, viz. \( f = y/tan \alpha \) and \( f' = y/tan \alpha' \). From the construction (fig. 6) tan \( w = y/tan \alpha \). The variation of the angle \( w \) by the second system is deduced from the equation to the convergence, viz. \( \gamma = \tan w \) \( \tan w = \tan w = \tan \alpha \), and since \( w = w' \), we have \( w = w' = \alpha \). From \( w = w' = \alpha \), we obtain in our notation, we have

\[
f = \frac{y}{\tan \alpha} \quad \frac{y}{\tan \alpha} = \frac{y}{\tan \alpha} = \frac{y}{\tan \alpha} \tag{9}
\]

By taking a ray proceeding from the image-side we obtain for the first principal focal distance the combination

\[
f = f \tag{10}
\]

In the particular case in which \( \Delta = 0 \), the two focal planes \( F_1, F_2 \) coincide, and the focal lengths \( f, f' \) are infinite. Such a system is called a telescopic system, and this condition is realized in a telescope focused for a normal eye.

So far we have assumed that all the rays proceeding from an object point are exactly united in an image-point after transmission through the ideal system. The question now arises so that for this system is justified for spherical lenses. To investigate this it is simplest to trace the path of a ray through one spherical
O to the point of incidence \( P \) by \( p \); the radius of the spherical surface by \( r \) and the distance \( OC \) by \( c \) being the centre of the sphere. Let \( u \) be the angle made by the ray with the axis, and \( i \) the angle of incidence, i.e. the angle between the ray and the normal to the sphere at the point of incidence. The corresponding quantities in the image-space are denoted by the same letters with a dash. From the triangle OPC we have \( \sin u = (r/c) \sin i \), and from the triangle O'PC we have \( \sin u' = (r/c') \sin i' \). By Snell's law we have \( \frac{n}{n'} = \frac{\sin i}{\sin i'} \), and also \( \phi = u - u' \). Consequently \( c' \) and the position of the image may be found.

To determine whether all the rays proceeding from \( O \) are refracted through \( O' \), we investigate the triangle OPO'. We have \( p'/p = \sin u'/\sin u \). Substituting for \( u \) and \( u' \) the values found above, we obtain \( p/p' = c' \sin i' \sin i = \tan \phi' \tan \phi \). Consequently, \( \phi' = \tan \phi \). Substituting these values we obtain

\[
\frac{p'}{p} = \frac{n(\phi - \phi')}{n(\phi' - \phi)} = \frac{\cos \phi}{\cos \phi'}
\]

Equation (6) then becomes

\[
\frac{n}{n'} = \frac{\cos \phi}{\cos \phi'}
\]

which is equal to

\[
\frac{n}{n'} = \frac{\cos \phi}{\cos \phi'}
\]

The difference of the focal points from the vertices of the lens, i.e. the distances \( F_{1} \) and \( F_{2} \), is the distance between the principal focal points. We have

\[
F_{1} = \frac{1}{r} \left( \frac{n^2}{n'} - 1 \right) \cos \phi = \frac{1}{r} \left( \frac{n^2}{n'} - 1 \right)
\]

when \( \cos \phi = 1 \). Hence, from (9), we have

\[
F_{1} = \frac{1}{r} \left( \frac{n^2}{n'} - 1 \right)
\]

The distance between the two principal planes (the interstitium) is deduced very simply. We have \( S_{1} = S_{1} + H'H' \) or \( H' = S_{1} - S_{1} \). Therefore, we have

\[
S_{1} + S_{1} = (n - 1)R
\]

so that

\[
S_{1} = (n - 1)R
\]

where \( S_{1} \) is the distance of the second principal focus from the vertex \( S_{1} \). The two focal lengths and the distances of the focal points from the vertices are known, the positions of the remaining cardinal points, i.e. the principal points \( H \) and \( H' \), are readily determined. Let \( s_{2} = S_{1} + H, i.e. the distance of the object-side principal point from the vertex of the first surface, and \( s_{1} = S_{1} - H' \), i.e. the distance of the image-side principal point from the vertex of the second surface, then \( f = FH = S_{1} + H - S_{1} + H' = s_{2} - s_{1} \), hence \( s_{2} = s_{1} + t \), and

\[
t = dr/R.\]

Similarly \( s_{2} = s_{1} + f = dR/R \). It is readily seen that the distances \( s_{2} \) and \( s_{1} \) are in the ratio of the radii \( r_{1} \) and \( r_{2} \).

The interstitium becomes zero, or the two principal planes coincide, if \( s_{2} = s_{1} \).

We have now derived all the properties of the lens in terms of its elements, viz. the refractive index, the radii of the surfaces, and the thickness.

Forms of Lenses.—By varying the signs and relative magnitude of the radii, lenses may be divided into two groups according to their action, and into four groups according to their form.

According to their action, lenses are either collecting, convergent
and condensing, or divergent and dispersing; the term positive is sometimes applied to the former, and the term negative to the latter. Convergent lenses transform a parallel pencil into a converging one, and increase the convergence, and diminish the divergence of any pencil. Divergent lenses, on the other hand, transform a parallel pencil into a diverging one, and diminish the convergence, and increase the divergence of any pencil. In convergent lenses the first principal focal distance is positive and the second principal focal distance negative; in divergent lenses the converse holds.

The four forms of lenses are interpretable by means of equation (10).

$$f = \frac{n \cdot r_n \cdot r_f}{(n-1) \cdot (r_n - r_f) + d(n-1)}$$

(1) If $r_1$ be positive and $r_2$ negative. This type is called biconvex (fig. 9). The first principal focus is in front of the lens and the second principal focus behind, and the two principal points are inside the lens. The order of the cardinal points is therefore $FS, HH', SF'$. The lens is convergent so long as the thickness is less than $n(r_1 - r_2)/(n-1)$. The special case when one of the radii is infinite is shown in fig. 9, 2. Such a collective lens is termed plano-convex. As $d$ increases, $F$ and $H$ move to the right and $F'$ and $H'$ to the left. If $d = n(r_1 - r_2)/(n-1)$, the focal length is infinite, i.e., the lens is telecentric. If the thickness be greater than $n(r_1 - r_2)/(n-1)$, the lens is divergent, and the order of the cardinal points is $HFS, S'F'$. (2) If $r_1$ is negative and $r_2$ positive, this type is called biconcave (fig. 9, 4). Such lenses are always divergent for all thicknesses. If $d$ increases, the radii remaining constant, the focal lengths diminish. It is seen from the equations giving the distances of the cardinal points from the vertices that the first principal focus $F$ is always behind $S$, and the second principal focus $F'$ always the object point, and that the principal points are within the lens, $H'$ always following $H$. If one of the radii becomes infinite, the lens is plano-convex (fig. 9, 5).

If the radii are both positive, these lenses are called conveccouere. Two cases occur according as $r_2 > r_1$ or $r_2 < r_1$. (a) If $r_2 > r_1$, we obtain the meniscus (fig. 9, 3). Such lenses are always collective; and the order of the cardinal points is $FH'H'$, $F$ always behind $S$, and the second principal focus $F'$ always the object point. If the thickness be greater than $n(r_1 - r_2)/(n-1)$, the lens is divergent so long as $d < n(r_1 - r_2)/(n-1)$. $H'$ is always behind $S$ and $H$ behind $S'$, since $s_2$ and $s_1$ are always positive. The focus $F$ is always behind $S'$. If the thickness is small, the order of the cardinal points is $FH'H'$, a divergent lens outside the lens (fig. 9, 6). As the thickness increases, $H'$ and $F'$ move to the right, $F$ more rapidly than $H'$, and $H$ more rapidly than $F'$; $F'$, on the other hand, moves to the left. As with biconvex lenses, a telescopic lens, having all the cardinal points at infinity, results when $d = n(r_1 - r_2)/(n-1)$. If $d > n(r_1 - r_2)/(n-1)$, $F$ is positive and the lens is collective. The cardinal points are in the same order as in the meniscus. (b) If $s_2 < s_1$, the case is analogous to (a) above, by assuming a change in the direction of the light, or, in other words, by interchanging the object- and image-spaces.

The six forms shown in fig. 9 are all used in optical constructions. It may be stated fairly generally that lenses which are thicker at the middle are collective, while those which are thinnest at the middle are divergent.

**Different Positions of Object and Image.**—The principal points are always near the surfaces limiting the lens, and consequently the lens divides the direct pencil containing the axis into two parts that can be either in front of or behind the lens as in fig. 10. If the rays pass through the lens, it is called real. If, on the other hand, the object be behind the lens, it is called virtual; it does not actually exist, and can only be realized as an image.

When we speak of "object-points," it is always understood that the rays from the object traverse the first surface of the lens before meeting the second. In the same way, images may be either real or virtual. If the image be behind the second surface, it is real, and can be intercepted on a screen. If, however, it be in front of the lens, it is visible to an eye placed behind the lens, although the rays do not actually intersect, but only appear to do so, but the image cannot be intercepted on a screen behind the lens.

Such an image is said to be virtual. These relations are shown in fig. 11.

By referring to the equations given above, it is seen that a thin convergent lens produces both real and virtual images of real objects, but only a real image of a virtual object, whilst a divergent lens produces a virtual image of a real object and both real and virtual images of a virtual object. The construction of a real image of a real object by a convergent lens is shown in fig. 3; and that of a virtual image of a real object by a divergent lens in fig. 12.

The optical centre of a lens is a point such that, for any ray which passes through it, the incident and emergent rays are parallel. The idea of the optical centre was originally due to J. Harris (Treatise on Optics, 1775); it is not properly a point, but a line, and has several interesting properties. In fig. 13, let $CP_1$ and $CP_2$ be two parallel radii of a biconvex lens. Join $P_1P_2$ and let $O_1P_1$ and $O_2P_2$ be incident and emergent rays which have $P_1P_2$ for the path through the lens. Then if $M$ be the intersection of $P_1P_2$ with the axis, we have angle $CP_1P = angle CP_2P_2$; these two angles are—for a ray travelling in the direction $O_1P_1O_2$—the angles of emergence and of incidence respectively. From the similar triangles $CP_1P_2$ and $CP_2P_1$, we have

$$C_1M \cdot C_2M = C_1P_2 \cdot C_2P_1 = r_1 \cdot r_2.$$ (11)

Such rays as $P_1P_2$ therefore divide the distance $C_1C_2$ in the ratio of the radii, i.e., at the fixed point $M$, the optical centre. Calling $S_1M = s_1, S_2M = s_2$, then $C_1S_1 = C_1M + MS_1 = C_2M - MS_2$, i.e., since $C_1S_1 = r_1, C_2M = r_2 + s_2$, and similarly $C_1M = r_2 - s_2$. Also $s_2S_2 = S_2M + MS_2 - S_1M - MS_1$, i.e., $d = s_2 - s_1$. Then by using equation (11) we have $s_1 = rd_1/(r_1 - r_2) = rd_2/(r_2 - r_1)$, and hence $s_1/s_2 = r_1/r_2$. The vertex distances of the optical centre are therefore in the ratio of the radii.

The values of $s_1$ and $s_2$ show that the optical centre of a biconvex or biconcave lens is in the interior of the lens, that in a plano-convex or plano-concave lens it is at the vertex of the curved surface, and that a convex-concave lens is in the vertex of the curved surface.

The **Wave-theory Derivation of the Focal Length.**—The formulæ above have been derived by means of geometrical rays. We here give an account of Lord Rayleigh's wave-theory derivation of the focal length of a convex lens in terms of the aperture, thickness and reflective index (Phil. Mag. 1879 (5) 8, p. 480; 1885, 20, 21.)
Taking the case of a convex lens of glass, let us suppose that parallel rays DA, EC, GB (fig. 14) fall upon the lens ACB, and are collected by it to a focus at F. The points D, E, G, equally distant from ACB, lie upon a front of the wave before it impinges upon the lens. The focus is at a point which the different parts of the wave arrive at the same time, and that such a point can exist depends upon the fact that the propagation is slower in glass than in air. The ray ECF is retarded from having to pass through the thickness (d) of glass by the amount \((n - 1)d\). The ray DAF, which traverses only the external thickness of the lens, is retarded merely on account of the crookedness of its path, \(\text{and so is } \frac{y^2}{2} = \text{approximately, whence} \end{align}\)

In the case of plate-glass \((n - 1) = \frac{1}{3}\) (nearly), and then the rule (12) may be thus stated: the semi-aperture of an ideal image (see aberration); (2) the intensity of radiation in the object- and image-spaces, in other words, the alteration of brightness caused by physical or geometrical influences; and (4) the regulation of the rays (Strahlenbegrenzung).

The regulation of rays will here be treated only in systems free from aberration. E. Abbe first gave a connected theory; and M. von Rohr has done a great deal towards the elaboration. The Gauss cardinal points make it simple to construct the image of a given object. No account is taken of the size of the system, or whether the rays used for the construction really assist in the reproduction of the image or not. The diverging cones of rays coming from the object-points can only take a small part in the production of the image in consequence of the apertures of the lenses, or of diaphragms. It often happens that the rays used for the construction of the image do not pass through the system, the image being formed by quite different rays. If we take a luminous point of the object lying on the axis of the system then an eye introduced at the image-point sees in the instrument several concentric rings, which are either the fittings of the lenses or their images, or the real diaphragms or their images. The innermost

![Fig. 14](image1.png)

![Fig. 15](image2.png)

and smallest ring is completely lighted, and forms the origin of the cone of rays entering the image-space. Above this ring lies a corresponding cone of light, and similarly there is a corresponding smallest ring in the object-space which limits the entering cone of rays. This is called the entrance pupil. The real diaphragm acting as a limit at any part of the system is called the aperture-diaphragm, or simply the diaphragm. These diaphragms remain for all practical purposes the same for all points lying on the axis. It sometimes happens that one and the same diaphragm fulfills the functions of the entrance pupil and the aperture-diaphragm or the exit pupil and the aperture-diaphragm.

Fig. 15 shows the general but simplified case of the different diaphragms which are of importance for the regulation of the reproduction. The two central systems, \(A\) is a real diaphragm lying between them, \(B_1\) and \(B_2\) are the fittings of the systems. Then \(S_1\) produces the virtual image \(A\) of the diaphragm \(A'\) and the image \(B_1\) of the fitting \(B_1\), whilst the system \(S_2\) makes the virtual image \(B_2\) and the virtual image \(A_2\) of the fitting \(B_2\). The object-point \(O\) is reproduced really through the whole system in the point \(O_2\). From the object-point \(O\) three diaphragms can be seen in the object-space, viz. the fitting \(B_1\), the image of the fitting \(B_2\) and the image-point \(A_2\) formed by the system \(S_2\). The cone of rays nearest to \(B_1\) is not received to its total extent by the fitting \(B_1\), and the cone which has entered through \(B_1\) is again diminished in its further course, when passing through the diaphragm \(A\), so that the cone of rays really used for reproducing the image is formed by \(A\) and \(B_2\), and the image of \(S_2\) formed from \(O\) appears to be the smallest. \(A\) is therefore the entrance pupil. The real diaphragm \(A\) which limits the rays in the centre of the system is the aperture diaphragm. Similarly three parts of the rays entering the instrument, viz. the entrance pupil \(A_1\) and \(A_2\) and the exit pupil \(A_3\) are conjugate to the exit pupil \(A_2\) throughout the instrument. This relation between entrance and exit pupils is general.

The apices of the cones of rays producing the image of points near the object, viz. in the object-space, and the common centre is the entrance pupil. The axis of such a cone, which connects the object point with the centre of the entrance pupil, is called the principal ray. Similarly, the principal rays in the image-space join the centre of the exit pupil with the image-points. The centres of the entrance and exit pupils are thus well defined, and the cones are thus the rays of the principal rays.

For points lying farther from the axis, the entrance pupil no longer alone limits the rays, the other diaphragms taking part. In fig. 16 only one diaphragm \(L\) is present besides the entrance pupil \(A\), and the object-space is divided to a certain extent into four parts. The section \(M\) contains all points rendered by a system with a complete aperture; \(N\) contains all points rendered by a system with a plane diminishing aperture; but this diminution does not attain the principal ray passing through the centre of the system \(O\). In the section \(O\) are those points rendered by a system with an aperture which gradually decreases to zero. No rays pass from the points of the section \(P\) through the system and no image can arise from them. The second diaphragm \(L\) therefore limits the three-dimensional object-space containing the points which can be rendered by the optical system. From \(C\) through this diaphragm \(L\) this three-dimensional object-space can be seen as through a window. \(L\) is called by M. von Rohr the entrance luke. If several diaphragms can be seen from \(C\), then the entrance luke is the diaphragm which seen from \(C\) appears the smallest. In the sections \(N\) and \(O\) the entrance luke also takes part in limiting the cones of rays. This restriction is known as the "vignetting" action of the entrance luke. The base of the cone of rays for the points of this section of the object-space is a cone of rays which is limited by a two-cornered curve which arises from the object-point by passing through the virtual image (see the entrance luke) on the entrance pupil. Fig. 17a shows the base of such a cone of rays. It often happens that besides the entrance luke another diaphragm acts in a vignetting manner, then the operating aperture of the cone of rays is a curve made up of circular arcs formed out of the entrance pupil and the two principal ray points of the instrument.
if the entrance pupil is increased. It then comprises all points reached by principal rays. The same relations apply to the image-space, in which there is an exit luke, which, seen from the middle of the exit pupil, appears under the smallest angle. It is the image of the entrance luke produced by the whole system. The image-side field of view \( \angle Z \) is the angle comprised by the principal rays reaching the edge of the exit luke.

Most optical instruments are used to observe object-reliefs (three-dimensional objects generally an image-relief (a three-dimensional image) is conjugate to this object-relief. It is sometimes required, however, to represent by means of an optical instrument the object-relief on a plane or on a ground-glass as in the photographic camera. For simplicity we shall assume the intersecting plane as perpendicular to the axis and shall call it, after M von Rohr, the "ground glass plane." All points of the image not lying in this plane produce circular spots (corresponding to the form of the pupil) on it, which are called circles of confusion. The ground-glass plane, perpendicular to the axis, and called the "plane focused for." All points lying in this plane are reproduced exactly on the ground-glass plane as the points OO. The circle of confusion for this is shown in fig. 18, Z on the plane focused for corresponds to the circle of confusion \( \angle Z \) on the ground-glass plane. The figure formed on the plane focused for by the cones of rays from all of the object-points of the total object-space directed to the entrance pupil, was called "object-side representation" (after M von Rohr). This representation is a central projection. If, for instance, the entrance pupil is imagined so small that only the principal rays pass through, then they project directly, and the intersections of the principal rays represent the points of the object lying on the plane focused for. The centre of the projection or the perspective centre is the middle point of the entrance pupil C. If the entrance pupil is opened, in place of points, circles of confusion appear, whose size depends upon the size of the entrance pupil and the position of the object-points and the plane focused for. The intersection of the principal ray is the centre of confusion. The clearness of the representation on the plane focused for is of course diminished by the circle of confusion. This central projection does not at all depend upon the instrument, but is entirely geometrical, arising when the position and the size of the entrance pupil, and the position of the plane focused for have been fixed. The instrument then produces an image on the ground-glass plane of this perspective representation on the plane focused for, and on account of the exact likeness which this image has to the object-side representation it is called the "representation copy." By moving it round an angle of \( \angle Z \), this representation can be brought into a perspective position; that is, all rays coming from the middle of the entrance pupil and acting on the object-points, would always meet the corresponding image-points. This representation is accessible to the observer in different ways in different instruments. If the observer desires a perfectly correct perspective impression of the object-relief the distance of the pivot of the eye from the representation copy must be equal to the point of the distance of the plane focused for from the entrance pupil, if the instrument has produced a parallel line to the object-side representation. The pivot of the eye must coincide with the centre of the perspective, because all images are observed in direct vision. It is known that the pivot of the eye is the point of intersection of all the rays which pass through it. Thus all these points represented by circles of confusion which are less than the angular sharpness of vision appear clear to the eye; the space containing all these object-points, which appear clear on the ground-glass plane, is the depth of definition; therefore, is not a special property of the instrument, but depends on the size of the entrance pupil, the position of the plane focused for and on the conditions under which the representation can be observed.

If the distance of the representation from the pivot of the eye be altered from the correct distance already mentioned, the angles of vision under which various objects appear are changed; perspective errors arise. And, using an incorrect idea to be given of the depth. A simple case is shown in fig. 19. A cube is the object, and if it is observed as in fig. 19a with the representation copy at the correct distance, a correct idea of a cube will be obtained. If, as in figs. 19b and 19c, the distance is too great, there can be two results. If it is known that the farthest section is just as high as the nearer one then the cube appears exceptionally deepened, like a long parallelepipedon. But if it is known to be as deep as it is high, then the eye will see it low at the back and high at the front. The reverse occurs when the distance of observation is too short, the body then appears either too flat, or the nearer sections seem too low in relation to those farther off. These perspective errors can be seen in any telescope. In the telescope occular the representation copy has to be observed under too large an angle or at too short a distance: all objects therefore appear flattened, or the more distant objects appear too large in comparison with those nearer at hand.

From the above the importance of experience will be inferred. But it is not only necessary that the objects themselves be known to the observer but also that they are presented to his eye in the customary manner. This depends upon the way in which the principal rays pass through the system—in other words, upon the special kind of "transmission" of the principal rays. In ordinary vision the pivot of the eye is the centre of the perspective representation, which arises on the very distant plane standing perpendicular to the mean direction of sight. In this kind of central projection all objects lying in the plane focused for are diminished when projected on this plane, and those lying behind it are magnified. (The rays of light are always given in the directions in which rays to the eye appear large and those farther from it appear small. This perspective has been called by M von Rohr "entocentric transmission" (fig. 20). If the entrance pupil of the instrument lies at infinity, then all the principal rays are parallel and the projections of all objects on the plane focused for are exactly as large as the objects themselves. After E. Abbe, this course of rays is called "telecentric transmission" (fig. 21). The exit pupil then lies in the image-side focus of the system. If the perspective centre lies in front of the plane focused for, then the objects lying in front of this plane are even more deepened and those behind it are diminished. This is just the reverse of perspective representation, in that the relations of size and the arrangements for space are quite incorrectly indicated (fig. 22); this representation is called by M von Rohr a "hypercentric transmission." (O. Hr.)

LENT (O. Eng. lenten, "spring," M. Eng. lenten, lente, lent; cf. Dut. lente, Ger. Lenz, "spring," O. H. Ger. lenzin, lengsin, lenzo, probably from the same root as "long" and referring to the lengthening days), in the Christian Church, the period of fasting preparatory to the festival of Easter. As this fast falls in the early part of the year, it became confused with the season, and gradually the word Lent, which originally meant spring, was connected with it. The Latin name for the fast, Quadragesima (whence Italian easter, easter, and French, Jour de l'oeuf, and its Gr. equivalent σεβασμός (now expressed by the term ἁρτοφερές "the fast"), are derived from the Sunday which was the fortieth day before Easter, as Quadragesima and Sexagesima are the fiftieth and sixtieth, Quadragesima being until the 7th century the caput jejunii or first day of the fast.

The length of this fast and the rigour with which it has been observed has varied greatly at different times and in different countries (see FASTING). In the time of Irenaeus the fast before Easter was very short, but very severe; thus some ate nothing for forty hours between the afternoon of Good Friday and the morning of Easter. This was the only authoritatively prescribed fast known to Tertullian (De jejunio, 2, 13, 14; De oratione, 18). In Alexandria about the middle of the 3rd century it was already 1 M von Rohr, Zeitschr. für Submersophiologie (1897), xiv. 408–429.
customary to fast during Holy Week; and earlier still the
Montanists boasted that they observed a two weeks' fast instead of one.
The Lent of the Ebriusc, that is, the fifty candles of the council of Nicaea (321), and from this
time it is frequently referred to, but chiefly as a season of prepara-
tion for baptism, of absolution of penitents or of retreat and
recollect. In this season fasting played a part, but it was not
universally nor rigorously enforced. At Rome, for instance,
the whole period of fasting was but three weeks, according to the
historian Socrates (Hist. eccl. v. 22), these three weeks, in Mgr.
Duchesne's opinion, being not continuous but, following the
primitive Roman custom, broken by intervals. Gradually,
however, the fast as observed in East and West became more
rigorously defined. In the East, where after the example of
the Church of Antioch the Quadragesima fast had been kept
distinct from that of Holy Week, the whole fast came to last
for seven weeks, both Saturdays and Sundays (except Holy
Saturday) being, however, excluded. In Rome and Alexandria,
and even in Jerusalem, Holy Week was included in Lent and the
whole fast lasted but six weeks, Saturdays, however, not being
exempt. Both at Rome and Constantinople, therefore, the actual
fast was but thirty-six days. Some Churches still continued the
three weeks' fast, but by the middle of the 5th century most of
these divergencies had ceased and the usages of Antioch-Con-
tinoplene and RomeAlexandria had become stereotyped in their
respective spheres of influence.

This fast is found as a tenth part of the year and therefore a perfect number, at first found a wide acceptance
(sos Cassianus, Coll. xxi. 30); but the inconsistency of this period
with the name Quadragesima, and with the forty days' fast of
Christ, came to be noted, and early in the 7th century four days
were added, by what pope is unknown, Lent in the West begin-
ing henceforth on Ash Wednesday (q.v.). About the same time
the cycle of paschal solemnities was extended to the ninth week
before Easter by the institution of national masses for Septua-
gesima, Sexagesima, and Quinquagesima Sundays. At Constanti-
nople, too, three Sundays were added and associated with the
Easter festival in the same way as the Sundays in Lent proper.
These three Sundays were added in the Greek Church also, and
the present custom of keeping an eight weeks' fast (i.e. exactly
8 x 5 days), now universal in the Eastern Church, originated in the
7th century. The Greek Lent begins on the Monday of Sexagesima,
with a week of preparatory fasting, known as 

γυμνόσελη, or the "butter-week"; the actual fast, however, starts on the Monday of Quinquagesima (Eostomi), this week being
known as the "first week of the fast" (ἔθαμα τῶν μορφῶν). The period of Lent is still described as "the six weeks of the fast," (ἔθαμα τῶν μορφῶν) not being reckoned in. The Lenten fast was
retained at the Reformation in some of the reformed Churches,
and is still observed in the Anglican and Lutheran communions.

In England a Lenten fast was first ordered to be observed by
Earconberht, king of Kent (640-664). In the middle ages, meat,
eggs and milk were forbidden in Lent not only by ecclesiastical
but by statute law; and this rule was enforced until the reign of
William III. The chief Lenten food from the earliest days was
fish, and entries in the royal household accounts of Edward III,
show the amount of fish supplied to the king. Herring-pies
were a great delicacy. Charters granted to seaports often stipulated that the town should send so many herring or other
fish to the king annually during Lent. How severely strict
medieval abstinence may be gauged from the fact that armies
and garrisons were sometimes, in default of dispensations,
as in the case of the siege of Orleans in 1429, reduced to starvation
for want of Lenten food, though in full possession of meat and
other supplies. The battle of the Herring (February 1429)
was fought in order to cover the march of a convoy of Lenten food
to the English army besieging Orleans. Dispensations from
fasting were, however, given in case of illness.

During the religious confusion of the Reformation, the practice of fasting was generally relaxed and it was found necessary to
reassert the obligation of keeping Lent and the other periods and
days of abstinence by a series of proclamations and statutes.
In these, however, the religious was avowedly subordinate to a
political motive, viz. to prevent the ruin of the fisheries, which
was the great nursery of English seamen. The statutes of 2 and 3 Edward VI, cap. 0 (1549), while incorporating that
"due and godly abstinence from flesh is a means to virtue," adds that "by the eating of fish much flesh is saved to the
country," and that thereby, too, the fishing trade is encouraged.
The statute, however, would not seem to have had much effect;
for in spite of a proclamation of Queen Elizabeth in 1560 imposing a fine of £20 for each offence on butchers slaughtering animals
during Lent, in 1563 Sir William Cecil, in Notes upon an Act for
the Increase of the Navy, says that "in old times no flesh at all was
eaten on fish days; even the king himself could not have license;
which was occasion of eating so much fish as now is eaten in flesh
upon fish days." The revolt against fish had ruined the fisheries
and driven the fishermen to turn pirates, to the great scandal and
detriment of the realm. Accordingly, in the session of 1562-
1563, Cecil forced upon an unwilling parliament "a political
ordnance on fish eating," by which the eating of flesh on fast
days was made punishable by a fine of three pounds or
three months' imprisonment, one meat dish being allowed on
Wednesdays on condition that three fish dishes were present on
the table. The kind of argument by which Cecil overcame the
Protestant temerity of the parliament is illustrated by a clause
which he had meditated adding to the statute, a draft of which
he showed to Sir John Herring-pies. He there warned: "the people should not "by the wilful misjudge the intent of the statute," it runs, "which is politically
meant only for the increase of fishermen and mariners, and not
for any superstition for choice of meats; whoever shall preach
or teach that eating of fish or forbearing of flesh is for the saving
of the soul of man, or for the service of God, shall be punished as
the spreader of false news" (Dom. MSS., Elizabeth, vol. xxvii).
But in spite of statutes and proclamations, of occasional severities
and of the patriotic example of Queen Elizabeth, the practice of fasting fell more and more into disuse. Ostentatious avoidance
of a fish-diet became, indeed, one of the outward symbols of
militant Protestantism among the Puritans. "I have often
noted," writes John Taylor, the water-poet, in his Jack a Lenten
(1620), "that if any superfluous feasting or gormandizing,
punch-cramping assembly do meet, it is so ordered that it must be
either in Lent, upon a Friday, or a fasting: for the meat
does not relish well except it be suaced with disobedience and
contempt of authority." The government continued to struggle
against this spirit of defiance; proclamations of James I. in
1619 and 1625, and of Charles I. in 1637 and 1631, again com-
manded abstinence from all flesh during Lent, and the High
Church movement of the 17th century lent a fresh religious
sanction to the official attitude. So late as 1687, James II.
issued a proclamation ordering abstention from meat; but,
after the Revolution, the Lenten laws fell obsolete, though they
remained on the statute-book till repealed by the Statute Law
Revision Act 1863. But during the 18th century, though the
strict observance of the Lenten fast was generally abandoned,
the statute was still observed and inculcated by the more earnest of
the clergy, such as William Law and John Wesley; and the custom
of women wearing mourning in Lent, which had been followed
by Queen Elizabeth and her court, survived until well into the
19th century. With the growth of the Oxford Movement in the
English Church, the practice of observing Lent was revived; and,
though no rules for fasting are authoritatively laid down, the
duty of abstinence is now very generally inculcated by bishops
and clergy, either as a discipline or as an exercise in self-denial.
For the more "advanced " Churches, Lenten practice tends
conform to that of the pre-Reformation Church.

Mid-Lent, or the fourth Sunday in Lent, was long known
as Mothering Sunday, in allusion to the custom for girls in
service to be allowed a holiday on that day to visit their
parents. They usually took as a present for their mother a
small cake known as a simnel. In shape it resembled a pork-
pie but in materials it was a rich plum-pudding. The word
is derived through Lat. simenulias, simella, from Lat. simila.
wheat flour. In Gloucestershire simnel cakes are still common; and at Uxbridge, Monmouth, the custom of mothering is still scrupulously observed.

LENTALL, WILLIAM (1591-1662), English parliamentarian, speaker of the House of Commons, second son of William Lenthal, of Lachford, Oxfordshire, a descendent of an old Herefordshire family, was born at Henley-on-Thames in January 1591. He left Oxford without taking a degree in 1609, and was called to the bar at Lincoln's Inn in 1616, becoming a bencher in 1633. He represented Woodstock in the Short Parliament (April 1640), and was chosen by King Charles I. to be speaker of the Long Parliament, which met on the 3rd of November 1640. According to Clarendon, a worse choice could not have been made, for Lenthal was of a "very timorous nature." He was treated with scanty respect in the chair, and seems to have had little control over the proceedings. On the 4th of January 1642, however, when the king entered the House of Commons to seize the five members, Lenthal behaved with great prudence and dignity. Having taken the speaker's chair and looked round in vain to discover the offending members, Charles turned to Lenthal standing below, and demanded of him whether any of those persons were in the House, whether he saw any of them and where they were." Lenthal fell on his knees and replied: "May it please your Majesty, I have neither eyes to see nor tongue to speak in this place but as the House is pleased to direct me, whose servant I am here." On the outbreak of the great rebellion, Lenthal threw in his lot with the parliament. He had already called attention to the inadequacy of his salary and been granted a sum of £6000 (9th of April 1642); and he was now appointed master of the rolls (22nd of November 1643), and one of the commissioners of the great seal (Oct. 1646-March 1648).

He carried on his duties as speaker without interruption till 1647, when the power of the parliament had been transferred to the army. On the 26th of July a mob invaded the House of Commons and obliged it to rescind the ordinance re-establishing the old parliamentary committee of militia; Lenthal was held in the chair by main force and compelled to put to the vote a resolution inviting the king to London. Threats of worse things came subsequently to Lenthal's ears, and, taking the mace with him, he left London on 9th of March to join the army and return to his two principal homes, Lenthal's and Manchester. The speaker of the Lords, headed the fugitive members at the review on Hounslow Heath on the 3rd of August, being received by the soldiers "as so many angels sent from heaven for their good." Returning to London with the army, he was installed again by Fairfax in the chair (6th August), and all votes passed during his absence were annulled. He adhered henceforth to the army party, but with a constant bias in favour of the king.

At the Restoration he claimed to have sent money to the king at Oxford, to have provided the queen with comforts and necessaries and to have taken care of the royal children. But he put the question for the king's trial from the chair, and continued to act as speaker after the king's execution. He still continued to use his influence in favour of the royalists, whenever this was possible without imperilling his own interests, and he saved the lives of both the earl of Norwich (8th March 1649) and Sir W. D'Avenant (3rd July 1650) by his casting vote. The removal of the king had left the parliament supreme; and Lenthal as its representative, though holding little real power, was the first man in the state.

His speakership continued till the 20th of April 1653, when the Long Parliament was summarily expelled. Cromwell directed Colonel Harrison, on the refusal of Lenthal to quit the chair, to pull him out—and Lenthal submitted to the show of force. He took no part in politics till the assembling of the first protectorate parliament, on the 3rd of September 1654, in which he sat as member for Oxfordshire. He was again chosen speaker, his former experience and his pliability of character being his chief recommendations. In the second protectorate parliament, summoned by Cromwell on the 17th of September 1656, Lenthal was again chosen member for Oxfordshire, but had some difficulty in obtaining admission, and was not re-elected speaker. He supported Cromwell's administration, and was active in urging the protector to take the title of king. In spite of his services, Lenthal was not included by Cromwell in his new House of Lords, and was much disappointed and crestfallen at his omission. The protector, hearing of his "grievous complaint," sent him a writ, and Lenthal was elated at believing he had secured a peerage. After Cromwell's death, the officers, having determined to recall the "Rump" Parliament, assembled at Lenthal's house at the Rolls (6th May 1659), to desire him to send out the writs. Lenthal, however, had no wish to resume his duties as speaker, preferring the House of Lords, and made various excuses for not complying. Nevertheless, upon the officers threatening to summon the parliament without his aid, and hearing the next morning that several members had assembled, he led the procession to the parliament house. Lenthal was now restored to the position of dignity which he had filled before. He was temporarily made keeper of the new great seal (14th of May). On the 6th of June it was voted that all commissions should be signed by Lenthal and not by the commander-in-chief. His exalted position, however, was not long unassailed. On 13th of July, after the action at Worcester, Lambert and the king and prevented the members from assembling. Lenthal's coach was stopped as he was entering Palace Yard, the mace was seized and he was obliged to return. The army, however, soon returned to their allegiance to the parliament. On the 24th of December they marched to Lenthal's house, and expressed their sorrow. On the 29th the speaker received the thanks of the reassembled parliament.

Lenthal now turned his attention to bring about the Restoration. He "very violently" opposed the oath abjuring the house of Stuart, now sought to be imposed by the republican faction on the parliament, and abstained himself from the House for ten days, to avoid, it was said, any responsibility for the bill. He had been in communication with Monk for some time, and on Monk entering London with his army (3rd February 1660) Lenthal met him in front of Somerset House. On the 6th of February Monk visited the House of Commons, when Lenthal pronounced a speech of thanks. On the 28th of March Lenthal forwarded to the king a paper containing "Heads of Advice." According to Monk, in October Lambert placed soldiers round the House and performed many services... which could not have been so well effected without his help." Lenthal notwithstanding found himself in disgrace at the Restoration. In spite of Monk's recommendation, he was not elected by Oxford University for the Convention Parliament, nor was he allowed by the king, though he had sent him a present of £5000, to remain master of the rolls. On the 11th of June he was included by the House of Commons, in spite of a recommendatory letter from Monk, among the twenty persons excepted from the act of indemnity and subject to penalties not extending to life. In the House of Lords, however, Monk's testimony and intercession were effectual, and Lenthal was only declared incapable of holding the future any public office. His last public act was a disgraceful one. Unmindful now of the privileges of parliament, he consented to appear as a witness against the regicide Thomas Scot, for words spoken in the House of Commons while Lenthal was in the chair. It was probably after this that he was allowed to present himself at court, and his contemporaries took a malicious glee in telling how "when, with some difficulty, he obtained leave to kiss the king's hand he, out of guilt, fell backward, as he was kneeling."

Lenthal died on the 3rd of September 1662. In his will he desired to be buried without any state and without a monument, "but at the utmost a plain stone with this superscription only, Vermis sum, acknowledging myself to be unworthy of the least outward regard in this world and unworthy of any remembrance that hath been so great a sinner." He was held in little honour by his contemporaries, and was universally regarded as a timorous man. He was, however, a man of good intentions, strong family affections and considerable ability. Unfortunately he was called by the irony of fate to fill a great office, in which,
LENTIL—

Lentil, the seed of Lens esculenta (also known as Eravum Lens), a small annual of the vetch tribe. The plant varies from 6 to 18 in. in height, and has many long ascending branches. The leaves are alternate, with six pairs of oblong-linear, obtuse, mucronate leaflets. The flowers, two to four in number, are of a pale blue colour, and are borne in the axils of the leaves, on a slender footstalk nearly equaling the leaves in length; they are produced in June or early in July. The pods are about 1 in. long, and contain from three to seven seeds, which are of the shape of a doubly convex lens, and about ¾ in. in diameter. There are several cultivated varieties of the plant, differing in size, hairiness and colour of the leaves, flowers and seeds. The last may be more or less compressed in shape, and in colour may vary from yellow or grey to dark brown; they are also sometimes motled or speckled. In English commerce two kinds of lentils are principally met with, French and Egyptian. The former are usually sold entire, and are of an ash-grey colour externally and of a yellow tint within; the latter are usually sold split peas, without the seed coat, and consist of the reddish-yellow cotyledons, which are smaller and rounder than those of the French lentil; the seed coat when present is of a dark brown colour. Considerable quantities of lentils are also imported into the United States.

The native country of the lentil is not known. It was probably one of the first plants brought under cultivation by mankind; lentils have been found in the lake dwellings of St. Peter's Island, Lake of Bienne, which are of the Bronze age. The name adas (Heb. 'ed) means wild lentils, and is found in one of the potagers of lentils for which Esau sold his birthright (Gen. xxv. 34) was apparently made from the red Egyptian lentil. This lentil is cultivated in one or other variety in India, Persia, Syria, Egypt, Nubia and North Africa, and in Europe, along the coast of the Mediterranean, and as far north as Germany, Holland and France. In Egypt, Syria and other Eastern countries the parched seeds are exposed for sale in shops, and esteemed the best food to carry on long journeys. Lentils form a chief ingredient in the Spanish guacho, and are used in a similar way in France and other countries. For this purpose they are usually sold in the shelled state.

The reddish variety of the lentil (lentillon d'hiver) is the kind most esteemed in Paris on account of the superior flavour of its seeds, which are hard and do not break when cooked with meat alone, and is cultivated chiefly in the north and east of France. The large or common variety, lentille large blonde, cultivated in Lorraine and at Gallardon (Eure-et-Loir), and largely in Germany, is the most productive, but is least esteemed. This kind has very small whitish flowers, two or rarely three on a footstalk, and the pods are generally one-seeded, the seeds being of a whitish or cream colour, about ⅜ of an inch broad and ⅛ in. thick. A single plant produces from 3 to 4 lb. of seed, which is sold whole, about ⅛ in. long and ⅛ in. broad. Another variety, with seeds similar in form, but smaller, less to the last, but of much smaller size, is known as the lentillon de Mars. It is sown in spring. This variety and the lentille large are both somewhat smaller than the former, thus are la reine. A small variety, lentille verte du Pay, cultivated chiefly in the departments of Haute Loire and Cantal, is also grown as a vegetable and for forage. The Egyptian lentil was introduced into Britain in 1820. It has blue flowers. Another species of lentil, Eravum monanthos, is grown in France about Orleans and elsewhere under the name of Jarretes and jarande. It is, according to Vilmorin, one of the best kinds of green food to grow on a poor dry sandy soil; on calcareous soil it does not succeed so well. It is usually sown in autumn with a little rye or winter oats, at the rate of a hectolitre to a hectare.

The lentil prefers a light warm sandy soil; on rich land it runs to leaf and produces but few pods. The seeds are sown in March or April in early May, according to the climate of the country, as they cannot endure night frosts. If for fodder they are sown broadcast, but in drills if the ripe seeds are required. The pods are gathered in August or September, as soon as they begin to turn brown—the plants being pulled up with flax while the foliage is still on them, a dry weather being necessary. A considerable mass of the seed takes place. Lentils keep best in the husk so far as flavour is concerned, and will keep good in this way for two years either for sowing or for food. An acre of ground yields on an average about 100 lb. of seed and 300 cwt. of straw. The amount and character of the mineral matter requisite in the soil may be judged from the analysis of the ash, which in the seeds has as its chief ingredients—potash 34-6% soda 9-3, lime 6-3, phosphoric acid 36-2, chloride of iron 17-6, and while in the straw it contains—lime 10-8, potash 5-3, silica 17-6, phosphoric acid 12-3, chloride of sodium 2-1.

Lentils have attracted considerable notice among vegetarians as a food material, especially for soup. A Hindu proverb says, "For soup lentil and bread but lentils are my life." The husk of the seed is indigestible, and to cook lentils properly requires at least two or a half hours, but they are richer in nutritious matter than almost any other kind of pulse, containing, according to Payen's analysis, 25-2% of nitrogenous matter (legumin), 56% of starch and 2-6% of fat. Fresele Epstein obtained 41-3% of starch; Hainkoff gives 36-5% and 41-2% of nitrogenous matter. Lentils are more properly the food of the poor in all countries where they are grown, and have often been spared when better fodder has been destroyed by pest or enemy. The seeds are called desit lent a gaudeire lente. The seeds are said to be good for pigeons, or mixed in a ground state with potatoes or barley for fattening pigs. The herbage is highly esteemed as green food for suckling ewes and all kinds of cattle (being said to increase the yield of milk), also for calves and lambs. Haller says that lentils are so flatulent as to kill horses. They were also believed to be the cause of severe scrofulous disorders common in Egypt. This bad reputation may possibly be due to the substitution of lentils for peas, or Eravum Erdula, a plant which closely resembles the true lentil in height, habit, flower and pod, but whose seeds are without doubt possessed of deleterious properties—producing weakness or even death in the case of the extreme debility of the animals on which them. The poisonous principle seems to reside chiefly in the bitter seed coat, and can apparently be removed by steeping in water, since Gerard, speaking of the "bitter vetch" (E. Erdula), says "kine in Asia and in most other countries do eat therof, being made sweet and wholesome in water. The seed of E. Erdula is about the same size, and almost exactly of the same reddish-brown colour as that of the Egyptian lentil, and when the seed coat is removed they are both of the same orange red hue, but the former is not so bright as the latter. The shape of the fruit distinguishes the two seeds, that of E. Erdula being obtusely triangular.

Sea-lentil is a name sometimes applied to the gulfweed Sargassum vulgare.

LENTULUS, the name of a Roman patrician family of the Cornelian gens, derived from lentus ("lentils"), which its oldest members were fond of cultivating (according to Pliny, Nat. Hist. xvi. 3, 10). The word Lentulitas ("Lentulism"); cf. Apelitias), coined by Cicero (Ad Fam. iii. 7, 5) to express the attributes of a pronounced aristocrat. The three first of the name were L. Cornelius Lentulus (consul 327 B.C.), Servius Cornelius Lentulus (consul 303) and L. Cornelius Lentulus Caudinus (consul 275). Their connexion with the later Lentulli (especially those of the Ciceronian period) is very obscure and difficult to establish. The following members of the family deserve mention.

PUBLIUS CORNELIUS LENTULUS, nicknamed Surus, one of the chief figures in the Catilinarian conspiracy. When accused by Sulla (to whom he had been quaestor in 81 B.C.) of having squandered the public money, he refused to render any account but insolently held out the calf of his leg (surus), on which part of the person boys were punished when they made mistakes in playing ball. He was praetor in 75, governor of Sicily 74, consul 71. In 70, being expelled from the senate with a number of others for immorality, he joined Catiline. Relying upon a Sibylline oracle that three Cornelii should be rulers of Rome, Lentulus regarded himself as the destined successor of Cornelius Sulla and Cornelius Cnina. When Catiline left Rome after Cicero's first speech In Catilinam, Lentulus took his place as chief of the conspirators in the city. In conjunction with C. Cornelius Cethegus, he undertook to murder Cicero and set fire to Rome, but the plot failed owing to his timidity and...
indiscretion. Ambassadors from the Allobroges being at the time in Rome, the bearers of a complaint against the oppressions of provincial governors, Lentulus made overtures to them, with the object of obtaining armed assistance. Pretending to fall in with their views, the ambassadors obtained a written agreement signed by the chief conspirators, and informed Q. Fabius Sanga, their "patron" in Rome, who in his turn acquainted Cicero. The conspirators were arrested and forced to admit their guilt. Lentulus was compelled to abrogate his praetorship, and, as it was feared that there might be an attempt to rescue him, he was put to death in the Tullianum on the 5th of December 63.

See Dio Cassius xxxvii. 30, xlvi. 20; Plutarch, Cicero, 17; Sallust, Catiline; Cicero, In Catilinam, iii., iv.; Pro Sulla, 25; also CATILINE.

PUBLIUS CORNELIUS LENTULUS, called Spinther from his likeness to an actor of that name, one of the chief adherents of the Pompeian party. In 63 B.C. he was curule aedile, assisted Cicero in the suppression of the Catilinarian conspiracy, and distinguished himself by the splendour of the games he provided. Praetor in 60, he obtained the governorship of Hispania Citerior (59) through the support of Caesar, to whom he was also indebted for his election to the consulship (57). Lentulus played a prominent part in the recall of Cicero from exile, and although a temporary coolness seems to have arisen between them, Cicero speaks of him in most grateful terms. From 56-53 Lentulus was governor of the province of Cilicia (with Cyprus) and during that time was commissioned by the senate to restore Ptolemy XI. Auletes to his kingdom (see PTOLEMEYS). The Sibylline books, however, declared that the king must not be restored by force of arms, at the risk of peril to Rome. As a provincial governor, Lentulus appears to have looked after the interests of his subjects, and did not enrich himself at their expense. In spite of his indebtedness to Caesar, Lentulus joined the Pompeians on the outbreak of civil war (49). The generosity with which he was treated by Caesar after the capitulation of Corfinium made him hesitate, but he finally decided in favour of Pompey. After the battle of Pharsalus, Lentulus escaped to Rhodes, where he was at first refused admission, although he subsequently found an asylum there (Cicero, Ad Att. xi. 13. 1). According to Aurelius Victor (De vir. ill. lxxviii., 9, if the reading be correct), he subsequently fell into Caesar's hands and was put to death. See Caesar, Bell. Civ. i. 15-23; iii. 102; Plutarch, Pompey, 49; Valerius Maximus ix. 14. 4; many letters of Cicero, especially Ad Fam. i. 1-9.

LUCIUS CORNELIUS LENTULUS, surnamed CRUS or CRUSCELLO (for what reason is unknown), member of the anti-Caesarian party. In 61 B.C. he was the chief accuser of P. Clodius (q.v.) in the affair of the festival of Bona Dea. When consul (49) he advised the rejection of all peace terms offered by Caesar, and declared that, if the senate did not at once decide upon opposing him by force of arms, he would act upon his own responsibility. There seems no reason to doubt that Lentulus was mainly inspired by selfish motives, and hoped to find in civil war an opportunity for his own aggrandizement. But in spite of his brave words he fled in haste from Rome as soon as he heard of Caesar's advance, and crossed over to Greece. After Pharsalus, he made his way to Rhodes (but was refused admission), thence, by way of Cyprus, to Egypt. He landed at Pelusium the day after the murder of Pompey, was immediately seized by Ptolemy, imprisoned, and put to death.

See Caesar, Bell. Civ. i. 4. iii. 104; Plutarch, Pompey, 86. A full account of the different Corneli Lentuli, with genealogical table, will be found in Pauly-Wissowa's Realencyclopädie, iv. pt. 1. p. 1355 (1900) (s.v. "Cornelius"); see also V. de Vit, Onomasticon, ii. 433.

LENZ, JAKOB MICHAEL REINHOLD (1751-1792), German poet. was born at Sesswegen in Livonia, the son of the village pastor, on the 12th of January 1751. He removed with his parents to Dorpat in 1759, and soon began to compose sacred odes, in the manner of Klostock. In 1768 he entered the university of Königsberg as a student of theology, and in 1771 accompanied, as tutor, two young German nobles, named von Kleist, to Strassburg, where they were to enter the French army. In Strassburg Lenz was received into the literary circle that gathered round Friedrich Rudolf Salzmann (1749-1821) and became acquainted with Goethe, at that time a student at the university. In order to be close to his young pupils, Lenz had to remove to Fort Louis in the neighbourhood, and while here became deeply enamoured of Goethe's friend, Friederike Elisabeth Brion (1752-1813), daughter of the pastor of Sesehnheim. Lenz endeavoured, after Goethe's departure from Strassburg, to replace the great poet in her affections, and to her he poured out songs and poems (Die Liebe auf dem Lande) which were long attributed to Goethe himself, as was also Lenz's first drama, the comedy, Der Hofmeister, oder Vorträge der Privaterziehung (1774). In 1776 he visited Weimar and was most kindly received by the duke; but his rude, overbearing manner and vicious habits led to his expulsion. In 1777 he became insane, and in 1779 was removed from Emmendingen, where J. G. Schlosser (1739-1799), Goethe's brother-in-law, had given him a home, to his native village. Here he lived in great poverty for several years, and then was given, more out of charity than on account of his merits, the appointment of tutor in a pension school near Moscow, where he died on the 24th of May 1792. Lenz, though one of the most talented poets of the Sturm und Drang period, presented a strange medley of genius and childlishness. His great, though neglected and distorted, abilities found vent in ill-conceived imitations of Shakespeare. His comedies, Der Hofmeister; Der neue Menoas (1774); Die Soldaten (1776); Die Freunde machen den Philosophen (1776), though accounted the best of his works, are characterized by unnatural situations and an incongruous mixture of tragedy and comedy.

Lenz's Gesammelte Schriften were published by L. Tieck in three volumes (1828); supplementary to these volumes are E. Dorer-Eggloth, J. M. R. Lenz und seine Schriften (1857) and K. Weinhold, Nachleben, Nachforschung, Nachbildung (1881). Most of Lenz's writings will be found in A. Sauer, Stürmer und Dränger, ii.; Kürschner's Deutsche Nationalliteratur, vol. ixxi. (1885). Further E. Schmidt, Lenz und Klinger (1879); J. Froitzheim, Lenz und Goethe (1891); H. Rauch, Lenz und Shakespeare (1899); F. Waldmann, Lenz in Briefen (1894).

LEO, the name of thirteen popes.

LEO I, who alone of Roman pontiffs shares with Gregory I. the surname of the GREAT, pope from 440 to 461, was a native of Rome, or, according to a less probable account, of Volterra in Tuscany. Of his family or early life nothing is known; that he was highly cultivated according to the standards of his time is obvious, but it does not appear that he could write Greek, or even that he understood that language. In one of the letters (Ep. 104) of Augustine, an acolyte named Leo is mentioned as having been in 418 the bearer of a communication from Sixtus of Rome (afterwards pope) to Aurelius of Carthage against the Pelagians. In 429, when the first unmistakable reference to Pope Leo occurs, he was still only a deacon, but already a man of commanding influence; it was at his suggestion that the De incarnatione of the aged Cassiodorus, having reference to the heresy, was composed. Towards the end of that year, and about 431 we find Cyril of Alexandria writing to him that he might prevent the Roman Church from lending its support in any way to the ambitious schemes of Juvenal of Jerusalem. In 440, while Leo was in Gaul, whither he had been sent to compose some differences between Aetius and another general named Albinus, Pope Sixtus III. died. The absent deacon, or rather archdeacon, was unanimously chosen to succeed him, and received consecration on his return six weeks afterwards (September 29). In 443 he began to take measures against the Manicheans (who since the capture of Carthage by Genseric in 439 had become very numerous at Rome), and in the following year he was able to report to the Italian bishops that some of the heretics had returned to Catholicism, while a large number had been sentenced to perpetual banishment "in accordance with the constitutions of the Christian emperors," and others had fled; in seeking these out the help of the provincial clergy was sought. It was during the earlier years of Leo's pontificate that the events in Gaul occurred which resulted in this triumph over Hilarius of Arles, signalized by the edict of Valentinian III.
LEO (POPES)

(445), denouncing the contumacy of the Gallic bishop, and
enjoining "that nothing should be done in Gaul, contrary to
ancient usage, without the authority of the bishop of Rome,
and that the decree of the apostolic see should henceforth be
saw." In 447 Leo held the correspondence with Turribius of
Astorga which led to the condemnation of the Priscillianists by
the Spanish national church. In 448 he received with commendation
a letter from Eutyches, the Constantinopolitan monk, com-
plaining of the revival of the Nestorian heresy there; and in
the following year Eutyches wrote his circular, appealing against
the sentence which at the instance of Eusebius of Dorylaeum
had been passed against him at a synod held in Constantinople
under the presidency of the patriarch Flavian, and asking papal
support at the oecumenical council at that time under summons
to meet at Ephesus. The result of a correspondence was that
Leo by his legates sent to Flavian that famous epistle in which
he sets forth with great fulness of detail the doctrine ever since
recognized as orthodox regarding the union of the two natures
in the one person of Jesus Christ. The events at the " robber "
synod at Ephesus belong to general church history rather than
to the biography of Leo; his letter, though submitted, was not
read, and the papal legates had some difficulty in escaping with
their lives from the ire of the theologians who, not content with
deposing Flavian and Eusebius, shouted for the dividing of those who divided Christ.
When the news of this of the oecumenical council (ecumenical in
every circumstance except that it was not presided over by
the pope) reached Rome, Leo wrote to Theodosius "with
groanings and tears," requesting the emperor to sanction another
council, to be held this time, however, in Italy. In this petition
he was supported by Valentine III., by the empress-mother
Galla Placidia and by the empress Eudoxia, but the appeal
was made in vain. A change, however, was brought about by
the accession in the following year of Marcian, who three days
after coming to the throne published an edict bringing within
the scope of the penal laws against heretics the supporters of
the dogmas of Apollinaris and Eutyches. To convoke a synod
in which greater orthodoxy might reasonably be expected
was in these circumstances no longer difficult, but all Leo's
efforts to secure that the meeting should take place on Italian
soil were at first unavailing, and the papal legates had to act
in 451, the papal legates were treated with great respect, and
Leo's former letter to Flavian was adopted by acclamation
as formulating the creed of the universal church on the subject
of the person of Christ. Among the reasons urged by Leo for
holding this council in Italy had been the threatening attitude
of the Huns; the dreaded irruption took place in the following
year (452). After Aquilia had succumbed to Attila's long
siege, the conqueror set out for Rome. Near the confluence of
the Mincio and the Po he was met by Leo, whose eloquence
persuaded him to turn back. Legend has sought to enhance
the impressiveness of the occurrence by an unnecessarily imagined
miracle. The pope was less successful with Genseric when the
Vandal chief arrived under the walls of Rome in 455, but he
secured a promise that there should be no incediam or
murder, and that three of the oldest basilicas should be exempt
from plunder—a promise which seems to have been faithfully
observed. Leo died on the 10th of November 461, the liturgical
anniversary being the 11th of April. His successor was Hilary
of Carthage, who had been one of the papal legates at the " robber "
synod in 449.
The title of doctor ecclesiae was given to Leo by Benedict
XIV. As bishop of the diocese of Rome, Leo distinguished
himself above all his predecessors by his preaching, to which
he devoted himself with great zeal and success. From his short
and pithy Sermones many of the lessons now to be found in the
Roman breviary have been taken. Viewed in conjunction
with his voluminous correspondence, the sermons sufficiently
explain the secret of his greatness, which chiefly lay in the
extraordinary strength and purity of his convictions as to the
primacy of the successors of St Peter at a time when the civil
and ecclesiastical troubles of the civilized world made men
willing enough to submit themselves to any authority whatsoever
that could establish its right to exist by courage, honesty and
knowledge of affairs.

The works of Leo I. were first collectively edited by Quesnel
(Paris, 1790); and again, on the basis of which is now the
standard edition by Ballerini (Venice, 1753-1756). Ninety-three
Sermones and one hundred and seventy-three Epistolae occupy
the first volume; the second contains the Liber Sacramentorum, usually
attributed to Leo, and the De Vocatione Omnium Gentium, also
attributed, by Quesnel and others, to him, but more probably
the production of a certain Prosper, of whom nothing further is known.
The works of Hilary of Arles are appended.

Leo II., pope from August 682 to July 685, was a Sicilian by
birth, and succeeded Agatho I. Agatho had been represented
at the sixth oecumenical council (that of Constantinople in
681), where Pope Honorius I. was anathematized for his views
in the Monothelite controversy as a favourer of heresy, and the
only fact of permanent historical interest with regard to Leo
is that he wrote once and again in approbation of the decision
of the council and in condemnation of Honorius, whom he
regarded as one who profusa prolatione immutatam sedem
subvertere conatus est. In their bearing upon the question of
papal infallibility the decisions of this council merit considerable
attention and controversy, and prominence is given to the statement
that in the Greek text of the letter to the emperor in which the phrase
occurs the milder expression παρεχωρησθί (subverteri
permisist) is used for subvertere conatus est. This Hefele in his
Conciliengeschichte (iii. 294) regards as alone expressing the true
meaning of Leo. It was during Leo's pontificate that the
dependence of the see of Ravenna upon that of Rome was finally
settled by imperial edict. Benedict II. succeeded him.

Leo III., whose pontificate (795-816) covered the last eighteen
years of the reign of Charlemagne, was a native of Rome, and
having been chosen successor of Adrian I. on the 26th of
December 795, was consecrated to the office on the following
day. His first act was to send to Charles as patronic the standard
of Rome along with the keys of the sepulchre of St Peter and of
the city; a gracious and condescending letter in reply made it
still more clear where all real power at that moment lay. For
more than three years his term of office was uneventful; but
at the end of that period the feelings of disappointment which
had secretly been rankling in the breasts of Paschalis and
Campulus, nephews of Adrian I., who had received from him the
offices of primicerius and sacellarius respectively, suddenly
manifested themselves in an organized attack upon Leo as he
was riding in procession through the city on the day of the
Greater Litany (25th April 799); the object of his assailants
was, by depriving him of his eyes and tongue, to disqualify him
for the papal office, and, although they were unsuccessful in this
attempt, he found it necessary to accept the protection of
Winegis, the Frankish duke of Spoleto, who came to the rescue.
Having vainly requested the presence of Charles in Rome, Leo
went beyond the Alps to meet the king at Paderborn; he was
received with much ceremony and respect, but his enemies
having sent in serious written charges, of which the character
is not now known, Charles decided to appoint both the pope
and his accusers to appear as parties before him when he should
have arrived in Rome. Leo returned in great state to his diocese,
and was received with honour; Charles, who did not arrive
in Rome until the following year, lost no time in assuming the
office of judge, and the result of his investigation was the
acquittal of the pope, who at the same time, however, was
permitted or rather required to clear himself by the oath of
compurgation. The coronation of the emperor followed two days
afterwards; its effect was to bring out with increased clearness
the personally subordinate position of Leo. The decision of
the emperor, however, secured for Leo's pontificate an external
peace which was only broken after the accession of Louis the
Pious. His enemies began to renew their attacks; the violent
repression of a conspiracy led to an open rebellion at Rome;
serious charges were once more brought against him, when he was
overthrown by death in 816. It was under this pontificate that
Felix of Urgel, the adoptianist, was anathematized (798) by a
Roman synod. Leo at another synod held in Rome in 810 admitted the dogmatic correctness of the *filioque*, but deprecated its introduction into the creed. On this point, however, the Frankish Church persevered in the course it had already initiated. Leo's successor was Stephen IV.

Leo IV., pope from 847 to 855, was a Roman by birth, and succeeded Sergius II. His pontificate was chiefly distinguished by his efforts to repair the damage done by the Saracens during the reign of his predecessor to various churches of the city, especially those of St Peter and St Paul. It was he who built and fortified the suburb on the right bank of the Tiber still known as the Civitas Leonina. A frightful conflagration, which he is said to have extinguished by his prayers, is the subject of Raphael's great work in the Sala del' Incendio of the Vatican. He held three synods, one of them (in 859) distinguished by the presence of Louis II., who was crowned emperor on the occasion, but none of them otherwise of importance. The history of the papal struggle with Hincmar of Reims, which began during Leo's pontificate, belongs rather to that of Nicholas I. Benedict III. was Leo's immediate successor.

Leo V., a native of Ardea, was pope for two months in 903 after the death of Benedict IV. He was overthrown and cast into prison by the priest Christopher, who installed himself in his place. Leo VI. succeeded John X. in 918, and reigned seven months and a few days. He was succeeded by Stephen VIII.

Leo VII., pope from 936 to 939, was preceded by John XI., and followed by Stephen IX.

Leo VIII., pope from 963 to 965, a Roman by birth, held the lay office of *protoscrivius* when he was elected to the papal chair at the instance of Otto the Great by the Roman synod which deposed John XII. in December 963. Having been hurried with unseemly haste through all the intermediate orders, he received consecration two days after his election, which was unacceptable to the people. In February 964, the emperor having withdrawn from the city, Leo found it necessary to seek safety in flight, whereupon he was deposed by a synod held under the presidency of John XII. On the sudden death of the latter, the populace chose Benedict V. as his successor; but Otto, returning and laying siege to the city, compelled their acceptance of Leo. It is usually said that, at the synod which deposed Benedict, Leo conceded to the emperor and his successors as sovereign of Italy full rights of investiture, but the genuineness of the document on which this allegation rests is more than doubtful. Leo VIII. was succeeded by John XIII.

Leo IX., pope from 1049 to 1054, was a native of Upper Alsace, where he was born on the 21st of June 1002. His proper name was Bruno; the family to which he belonged was of noble rank, and through his father he was related to the emperor Conrad II. He was educated at Toul, where he successively became canon and (929) bishop; in the latter capacity he rendered important political services to his relative Conrad II., and afterwards to Henry III., and at the same time he became widely known as an earnest and reforming ecclesiastical by the zeal he showed in enforcing the rule of the order of Cluny. On the death of Damasus II., Bruno was in December 1048, with the concurrence both of the emperor and of the Roman delegates, selected his successor by an assembly at Worms; he stipulated, however, as a condition of his acceptance that he should first proceed to Rome and be canonically elected by the voice of clergy and people. Setting out shortly after Christmas, he had a meeting with abbot Hugo of Cluny at Besançon, where he was joined by the young monk Hildebrand, who afterwards became Pope Gregory VII.; arriving in pilgrim garb at Rome in the following February, he was received with much cordiality, and at his consecration assumed the name of Leo IX. One of his first public acts was to hold the well-known Easter synod of 1049, at which celibacy of the clergy (down to the rank of subdeacon) was anew enjoined, and where he at least succeeded in making clear his own convictions against every kind of simony. The greater part of the year that followed was occupied in one of those progresses through Italy, Germany and France which form a marked feature in Leo's pontificate. After presiding over a synod at Favia, he joined the emperor Henry III. in Saxony, and accompanied him to Cologne and Aix-la-Chapelle; to Reims he also summoned a meeting of the higher clergy, by which several important reforming decrees were passed. At Mainz also he held a council, at which the Italian and French as well as the German clergy were represented, and ambassadors of the Greek emperor were present; here too simony and the marriage of the clergy were the principal matters dealt with. After his return to Rome he held (29th April 1050) another Easter synod, which was occupied largely with the controversy about the teachings of Berengarius of Tours; in the same year he presided over provincial synods at Salerno, Siponto and Vercelli, and in September revisited Germany, returning to Rome in time for a third Easter synod, at which the question of the reordination of those who had been ordained by simonists was considered. In 1052 he joined the emperor at Pressburg, and vainly sought to secure the submission of the Hungarians; and at Regensburg, Bamberg and Worms the papal presence was marked by various ecclesiastical solemnities. After a fourth Easter synod in 1053 Leo set out against the Normans in the south with an army of Italians and German volunteers, but his forces sustained a total defeat at Astignum near Civitella (15th June 1053); on going out, however, from the city to meet the enemy he was received with every token of submission, relief from the pressure of his ban was implored and fidelity and homage were sworn. From June 1053 to March 1054 he was nevertheless detained at Benevento in honourable captivity; he did not lose his return to Rome, where he died on the 19th of April 1054. He was succeeded by Victor II.

Leo X. [Giovanni de' Medici] (1475-1521), pope from the 11th of March 1513 to the 1st of December 1513, was the second son of Lorenzo de' Medici, called the Magnificent, and was born at Florence on the 11th of December 1475. Destined from his birth for the church, he received the tonsure at the age of seven and was consecrated bishop of Rieti, where his father, the late cardinal, had also been placed. From 1516 to 1517 he prevailed on Innocent VIII. to name him cardinal-deacon of Sta Maria in Dominiea in March 1489, although he was not allowed to wear the insignia or share in the deliberations of the college until three years later. Meanwhile he received a careful education at Lorenzo's brilliant humanistic court under such men as Angelo Poliziano, the classical scholar, Pico della Mirandola, the philosopher and theologian, the pious Marsilio Ficino who endeavoured to unite the Platonic cult with Christianity and the poet Bernardino Dovizio Bibbiena. From 1489 to 1491 he studied theology and canon law at Pisa under Filippo Decio and Bartolomeo Sozzini. On the 23rd of March 1492 he was formally admitted into the sacred college and took up his residence at Rome, receiving a letter of advice from his father which ranks among the wisest of its kind. The death of Lorenzo on the 8th of April, however, called the seventeen-year-old cardinal to Florence. He participated in the conclave which followed the fall of Innocent VIII. in July 1492 and opposed the election of Cardinal Borgia. He made his home with his elder brother Piero at Florence throughout the agitation of Savonarola and the invasion of Charles VIII. of France, until the uprising of the Florentines and the expulsion of the Medici in November 1494. While Piero found refuge at Venice and Urbino, Cardinal Giovanni travelled in Germany, in the Netherlands and in France. In May 1500 he returned to Rome, where he was received with outward cordiality by Alexander VI., and where he lived for several years immersed in art and literature. In 1503 he welcomed the accession of Julius II. to the pontificate; the death of Piero de' Medici in the same year made Giovanni head of his family. On the 1st of October 1511 he was appointed papal legate of Bologna and the Romagna, and when the Florentine republic declared in favour of the schismatic Pisans Julius II. sent him against his native city at the head of the papal army. This and other attempts to regain political control of Florence were frustrated, until a bloodless revolution permitted the return of the Medici on the 14th of September 1512. Giovanni's younger brother Giuliano was placed at the head of the republic, but the cardinal actually
managed the government. Julius II. died in February 1513, and the conclave, after a stormy seven-day's session, united on Cardinal de' Medici as the candidate of the younger cardinals. He was ordained to the priesthood on the 15th of March, consecrated bishop on the 17th, and enthroned with the name of Leo X. on the 19th. There is no evidence of simony in the conclave, and Leo's election was hailed with delight by the Romans on account of his reputation for liberality, kindness and love of peace. Following the example of many of his predecessors, he promptly repudiated his election "capitulation" as an infringement on the divinely bestowed prerogatives of the Holy See.

Many problems confronted Leo X. on his accession. He must preserve the papal conquests which he had inherited from Alexander VI. and Julius II. He must minimize foreign influence, whether French, Spanish or German, in Italy. He must put an end to the Fissan schism and settle the other troubles incident to the French invasion. He must restore the French Church to Catholic unity, abolish the pragmatic sanction of Bourges, and bring to a successful close the Lateran council convoked by his predecessor. He must stay the victorious advance of the Turks. He must quiet the disagreeable wranglings of the German humanists. Other problems connected with his family interests served to complicate the situation and eventually to prevent the successful consummation of many of his plans. At the very time of Leo's accession Louis XII. of France, in alliance with Venice, was making a determined effort to regain the duchy of Milan, and the pope, after fruitless endeavours to maintain peace, joined the league of Mechlin on the 5th of April 1513 with the emperor Maximilian I., Ferdinand I. of Spain and Henry VIII. of England. The French and Venetians were at first successful, but on the 6th of June met overwhelming defeat at Novara. The Venetians continued the struggle until October. On the 19th of December the fifth Lateran council, which had been reopened by Leo in April, ratified the peace with Louis XII. and registered the conclusion of the Fissan schism. While the council was engaged in planning a crusade and in considering the reform of the clergy, a new crisis occurred between the pope and the king of France. Francis I., who succeeded Louis XII. on the 1st of January 1515, was an enthusiastic young prince, dominated by the ambition of recovering Milan and Naples. Leo at once formed a new league with the emperor and the king of Spain, and to ensure English support made Wolsey a cardinal. Francis entered Italy in August and on the 14th of September won the battle of Marignano. The pope in October signed an agreement binding him to withdraw his troops from Parma and Piacenza, which had been previously gained at the expense of the duchy of Milan, on condition of French protection at Rome and Florence. The king of Spain wrote to his ambassador at Rome "that His Holiness had hitherto played a double game and that all his zeal to drive the French from Italy had been only a mask"; this reproach seemed to receive some confirmation when Leo X. held a secret conference with Francis at Bologna in December 1515. The ostensible subjects under consideration were the establishment of peace between France, Venice and the Empire, with a view to an expedition against the Turks, and the ecclesiastical affairs of France. Precisely what was arranged is unknown. During these two or three years of incessant political intrigue and warfare it was not to be expected that the Lateran council should accomplish much. Its three main objects, the peace of Christendom, the crusade and the reform of the church, could be secured only by general agreement among the powers, and Leo or the council failed to secure such agreement. Its most important achievements were the registration at its eleventh sitting (19th December 1516) of the abolition of the pragmatic sanction, which the popes since Pius II. had unanimously condemned, and the confirmation of the concordat between Leo X. and Francis I., which was destined to regulate the relations between the French Church and the Holy See until the Revolution. Leo closed the council on the 16th of March 1517. It had ended the schism, ratified the censorship of books introduced by Alexander VI. and imposed tithes for a war against the Turks. It raised no voice against the primacy of the pope.

The year which marked the close of the Lateran council was also signalized by Leo's unholy war against the duke of Urbino. The pope was naturally proud of his family and had practised nepotism from the outset. His cousin Giulio, who subsequently became Clement VII., had made the most influential man in the curia, naming him archbishop of Florence, cardinal and vice-chancellor of the Holy See. Leo had intended his younger brother Giuliano and his nephew Lorenzo for brilliant secular careers. He had named them Roman patricians; the latter he had placed in charge of Florence; the former, for whom he planned to carve out a kingdom in central Italy of Parma, Piacenza, Ferrara and Urbino, he had taken with himself to Rome and married to Filiberta of Savoy. The death of Giuliano in March 1516, however, caused the pope to transfer his ambitions to Lorenzo. At the very time (December 1516) that peace between France, Spain, Venice and the Empire seemed to give some promise of a Christendom united against the Turk, Leo was preparing an enterprise as unscrupulous as any of the similar exploits of Cesare Borgia. He obtained 150,000 ducats towards the expenses of the expedition from Henry VIII. of England, in return for which he promised the imperial league of Spain and England against France. The war lasted from February to September 1517 and ended with the expulsion of the duke and the triumph of Lorenzo; but it revived the nefarious policy of Alexander VI., increased brigandage and anarchy in the States of the Church, hindered the preparations for a crusade and wrecked the papal finances. Guicciardini reckoned the cost of the war to Leo at the prodigious sum of 800,000 ducats. The new duke of Urbino was the Lorenzo de' Medici to whom Machiavelli addressed The Prince. His marriage in March 1518 was arranged by the pope with Madeleine la Tour d'Auvergne, a royal princess of France, whose daughter was the Catherine de' Medici celebrated in French history. The war of Urbino was further marked by a crisis in the relations between pope and cardinals. The sacred college had grown especially worldly and troublesome since the time of Sixtus IV., and Leo took advantage of a plot of several of its members to poison him, not only to inflict exemplary punishments by executing one and imprisoning several others, but also to make a radical change in the college. On the 3rd of July 1517 he published the names of thirty-one new cardinals, a number almost unprecedented in the history of the papacy. Some of the nominations were excellent, such as Lorenzo Campeggio, Giambattista Pallavicini, Adrian of Utrecht, Cajetan, Cristoforo Nuñal and Egidio Canisio. The naming of seven members of prominent Roman families, however, reversed the wise policy of his predecessor which had kept the dangerous factions of the city out of the curia. Other promotions were for political or family considerations or to secure money for the war against Urbino. The pope was accused of having exaggerated the conspiracy of the cardinals for purposes of financial gain, but most of such accusations appear to be unsubstantiated.

Leo, meanwhile, felt the need of staying the advance of the warlike sultan, Selim I., who was threatening western Europe, and made elaborate plans for a crusade. A truce was to be proclaimed throughout Christendom; the pope was to be the arbiter of war and peace; the king of France was to lead the army; England, Spain and Portugal were to furnish the fleet; and the combined forces were to be directed against Constantinople. Papal diplomacy in the interests of peace failed, however; Cardinal Wolsey made England, not the pope, the arbiter between France and the Empire; and much of the money collected for the crusade from tithes and indulgences was spent in other ways. In 1519 Hungary concluded a three years' truce with Selim I., but the succeeding sultan, Suleiman the Magnificent, renewed the war in June 1521 and on the 28th of August captured the citadel of Belgrade. The pope was greatly alarmed, and although he was then involved in war with France he sent about 30,000 ducats to the Hungarians. Leo treated the Uniate Greeks with great loyalty, and by bull of the 18th of May 1521 forbade Latin clergy to celebrate mass in Greek churches and Latin bishops to ordain Greek clergy.
These provisions were later strengthened by Clement VII. and Paul III. and were far to settle the chronic disputes between the Latins and Uniate Greeks.

Leo was disturbed throughout his pontificate by heresy and schism. The dispute between Reuchlin and Pfefferkorn relative to the Talmud and other Jewish books was referred to the pope in September 1513. He in turn referred it to the bishops of Spires and Worms, who gave decision in March 1514 in favour of Reuchlin. After the appeal of the inquisitor-general, Hochstraten, and the appearance of the Epistulae obscurorum viorum, however, Leo annulled the decision (June 1520) and imposed silence on Reuchlin. The pope had already authorized the extensive grant of indulgences in order to secure funds for the crusade and more particularly for the rebuilding of St Peter's at Rome. Against the attendant abuses abuses the Augustinian monk Martin Luther (q.v.) posted (31st October 1517) on the church door at Wittenberg his famous ninety-five theses, which were the signal for widespread revolt against the church. Although Leo did not fully comprehend the import of the movement, he directed (23rd February 1518) the vicar-general of the Augustinians to impose silence on the monks. On the 30th of May Luther sent an explanation of his theses to the pope; on the 7th of August he was cited to appear at Rome. An arrangement was effected, however, whereby that citation was cancelled, and Luther betook himself in October 1518 to Augsburg to meet the papal legate, Cardinal Cajetan, who was attending the imperial diet convened by the emperor Maximilian to impose the tithes for the Turkish war and to elect a king of the Romans; but neither the arguments of the learned cardinal, nor the dogmatic papal bull of the 9th of November to the effect that all Christians must believe in the pope's power to grant indulgences, moved Luther to retract. A year of fruitless negotiation followed, during which the pamphlets of the reformer set all Germany on fire. A papal bull of the 15th of June 1520, which condemned forty-one propositions extracted from Luther's teachings, was published in Germany by Eek in his capacity of apostolic vicar, published by him and the legates Alexander and Caracciola, and burned by Luther on the 10th of December at Wittenberg. Leo then formally excommunicated Luther by bull of the 3rd of January 1521; and in a brief directed the emperor to take energetic measures against hisesy. On the 26th of May 1521 the emperor signed the edict of the diet of Worms, which placed Luther under the ban of the Empire; on the 21st of the same month Henry VIII. of England sent to Leo his book against Luther on the seven sacraments. The pope, after careful consideration, conferred on the king of England the title "Defender of the Faith" by bull of the 15th of October 1521. Neither the imperial edict nor the work of Henry VIII. stayed the Lutheran movement, and Luther himself, safe in the solitude of the Wartburg, survived Leo X. It was under Leo X. also that the Protestant movement had its beginning in Scandinavia. The Pope had repeatedly used the northern provinces to reward members of the Roman curia, and towards the close of the year 1516 he sent the grasping and impolitic Arcimboldi as papal nuncio to Denmark to collect money for St Peter's. King Christian II. took advantage of the growing dissatisfaction on the part of the native clergy toward the papal government, and of Arcimboldi's interference in the Swedish revolt, in order to expel the nuncio and summon (1520) Lutheran theologians to Copenhagen. Christian approved a plan by which a formal state church should be established in Denmark, all appeals to Rome should be abolished, and the king and diet should have final jurisdiction in ecclesiastical causes. Leo sent a new nuncio to Copenhagen (1521) in the person of the Minorite Francesco de Potentia, who readily absolved the king and received the rich bishopric of Skara. The pope or his legate, however, took no steps to remove abuses or otherwise reform the Scandinavian churches.

Leo did not do more to check the tendency toward heresy and schism in Germany and Scandinavia to be partially explained by the political complications of the time, and by his own preoccupation with schemes of papal and Medicean aggrandizement in Italy. The death of the emperor Maximilian on the 12th of January 1519 had seriously affected the situation. Leo vacillated between the powerful candidates for the succession, allowing it to appear at first that he favoured Francis I. while really working for the election of some minor German prince. He finally accepted Charles I. of Spain as inevitable, and the election of Charles (28th of June 1519) revealed Leo's desertion of his French alliance, a step facilitated by the death at about the same time of Lorenzo de' Medici and his French wife. Leo was now anxious to unite Ferrara, Parma and Piacenza to the States of the Church. An attempt late in 1519 to seize Ferrara failed, and the pope recognized the need of foreign aid. In May 1521 a treaty of alliance was signed at Rome between him and the emperor. Milan and Genoa were to be taken from France and restored to the Empire, and Parma and Piacenza were to be given to the Church on the expulsion of the French. The expense of enlistig 10,000 Swiss was to be borne equally by pope and emperor. Charles took Florence and the Medici family under his protection and promised to punish all enemies of the Catholic faith. Leo agreed to invest Charles with Naples, to crown him emperor, and to aid in a war against Venice. It was provided that England and the Swiss might join the league. Henry VIII. announced his adherence in August. Francis I. had already begun war with Charles in Navarre, and in Italy, too, the French made the first hostile movement (3rd June 1521). Leo at once announced that he would excommunicate the king of France and release his subjects from their allegiance unless Francis laid down his arms and surrendered Parma and Piacenza. The pope lived to hear the joyful news of the capture of Milan from the French and of the occupation by papal troops of the long-coveted provinces (November 1521). Leo X. died on the 1st of December 1521, so suddenly that the last sacraments could not be administered; but the contemporary suspicions of poison were unfounded. His successor was Adrian VI.

Several minor events of Leo's pontificate are worthy of mention. He abolished papal conciliar taxation throughout the Papal States, and imposed a new tax on the printing-press at Rome. He approved the formation of the Oratory of Divine Love, a group of pious men at Rome which later became the Theatine Order, and he canonized Francesco di Paola.

As patron of learning Leo X. deserves a prominent place among the popes. He raised the church to a high rank in the friend of whatever seemed to extend knowledge or to refine and embellish life. He made the capital of Christendom the centre of culture. Every Italian artist and man of letters in an age of singular intellectual brilliancy tasted or hoped to taste of his bounty. While yet a cardinal, he had restored the church of Sta Maria in Domnica after Raphael's designs; and as pope he built S. Giovanni on the Via Giulia after designs by Jacopo Sansovino and pressed forward the work on St Peter's and the Vatican under Raphael and Chigi. His constitution of the 5th of November 1513 reformed the Roman University, which had been neglected by Julius II. He restored all its faculties, gave larger salaries to the professors, and summoned distinguished teachers from afar; and, although it never attained to the importance of Padua or Bologna, it nevertheless possessed in 154 an excellent faculty of eighty-eight professors. Leo called Theodore Lascaris to Rome to give instruction in Greek, and established a Greek printing-press from which the first book printed at Rome appeared in 1515. He made Raphael custodian of the classical antiquities of Rome and the vicinity. The distinguished Latinists Pietro Bembo (1470-1547) and
Jacopo Sadoleto (1477-1542) were papal secretaries, as well as the famous poet Bernardo Acociti (d.1534). Writers of poetry like Vida (1490-1566), Trissino (1475-1550), and Bibbiena (1470-1520), writers of novelle like Bandello, and a hundred other litterati of the time were bishops, or papal scriptors or abbreviators, or in other papal employ. Leo's lively interest in art and literature, to say nothing of his natural liberality, his nepotism, his political ambitions and necessities, and his immediate personal luxury, exhausted within two years the hard savings of Julius II, and precipitated a financial crisis from which he never emerged and which was a direct cause of most of the calamities of his pontificate. He created many new offices and shamelessly sold them. He sold cardinals' hats. He sold membership in the "Knights of Peter." He borrowed large sums from bankers, curials, princes and Jews. The Venetian ambassador Gradenigo estimated the paying number of offices on Leo's death at 2159, with a capital value of nearly 3,000,000 ducats and a yearly income of 328,000 ducats. Marino Giorgi reckoned the ordinary income of the pope for the year 1517 derived from 500,000 ducats, of which 420,000 came from the States of the Church, 100,000 from annates, and 60,000 from the composition tax instituted by Sixtus IV. These sums, together with the considerable amounts accruing from indulgences, jubilees, and special fees, vanished as quickly as they were received. Then the pope resorted to pawning palace furniture, table plate, jewels, even statues of the apostles. Several banking firms and many individual creditors were ruined by the death of the pope.

In the past many conflicting estimates were made of the character and achievements of the pope during whose pontificate Protestantism first took form. More recent studies have served to produce a fairer and more honest opinion of Leo X. A report of the Venetian ambassador Marino Giorgi bearing date of March 1517 indicates some of his predominant characteristics:—

"The pope is a good-natured and extremely free-hearted man, who avows his thoughts and above all wants peace; he would not undertake a war himself on his own account, but his interests were involved; he loves learning; of canon law and literature he possesses remarkable knowledge; he is, moreover, a very excellent musician." Leo was dignified in appearance and elegant in speech, manners and writing. He enjoyed music and the theatre, art and poetry, the masterpieces of the ancients and the wonderful creations of his contemporaries, the spiritual and the witty—life in every form. It is by no means certain that he made the remark often attributed to him, "Let us enjoy the papacy since God has given it to us," but there is little doubt that he was by nature devoid of moral earnestness or deep religious feeling. On the other hand, in spite of his worldliness, Leo was not an unbeliever; he prayed, fasted, and participated in the services of the church with conscientiousness. To the virtues of liberality, charity and demeny he added the Machiavelian qualities of falsehood and shrewdness, so highly esteemed by the princes of his time. Leo X with fatal success, often by his contemporaries, but an incurable malady, wars, envy, the conspiracy of cardinals, and the loss of all his nearest relations darkened his days; and he failed entirely in his general policy of expelling foreigners from Italy, of restoring peace throughout Europe, and of prosecuting war against the Turks. He failed to recognize the pressing need of reform within the church and the tremendous dangers which threatened the papal monarchy; and he un puppiesingly neglected the spiritual needs of the time. He was, however, zealous in firmly establishing the political power of the Holy See; he made it unquestionably supreme in Italy; he successfully restored the papal power in France; and he secured a prominent place in the history of culture.

At the close of Leo X.—The life of Leo X. was written shortly after his death by Paolo Giovio, bishop of Nocera, who had known him intimately. Other important contemporary sources are the Italian History of the Florentine writer Guicciardini, covering the period 1492-1530 (4 vols., Milan, 1864); the reports of the Venetian ambassador, Antonio Giorgi (1517), Marco Minio (1520) and Luigi Gradenigo (1523), in vol. iii. of the 2nd series of Le Relazioni degli ambasciatori Veneti, edited by Alberi (Florence, 1846); and the Diarii of the Venetian Marino Sanuto (58 vols., 1879-1903). Other materials for the biography are to be found in the incomplete Regesta edited by Joseph Cardinal Hergenröther (Freiburg-i-B., 1884-92), in the Turin collection of papal bulls (1859, &c.); in Il Diario di Leone X., dai volumi manoscritti degli archivi Vaticani della S. Sede consolle di M. Armellini (Rome, 1884); and in "Documenti riguardanti Giovanni de' Medici e il pontefice Leone X." appendix to vol. vii. of the Archivio storico Italiano (Florence, 1884).

Leo XI. (Alessandro de' Medici) was elected pope on the 1st of April 1605, in the age of seventy. He had long been archbishop of Florence and nuncio to Tuscany; and was entirely pro-French in his sympathies. He died on the 27th day of his pontificate, and was succeeded by Paul V.

See the contemporary life by Vitorelli, continuator of Ciacconius, Vita e res gestae sumorum Pontif. Rom.; Ranke, Popes (Eng. trans., Austin), ii. 330; v. Reumont, Gesch. der Stadt Rom. iii. 2, 604; Brosch, Gesch. des Kirchengesch. (1880), i. 350.

Leo XII. (Annibale della Genga), pope from 1823 to 1829, was born of a noble family, near Spoletto, on the 22nd of August 1760. Educated at the Accademia dei Nobili ecclesiastici at Rome, he was ordained priest in 1783, and in 1790 attracted favourable attention by a tactful sermon commemorative of the emperor Joseph II. In 1792 Pius VI. made him his private secretary, in 1793 creating him titular archbishop of Tyre and making him director of the Vatican chancery. In 1798 he transferred to the nunciature at Cologne, but owing to the war had to resign his position. He made his residence in Augsburg. During the dozen or more years he spent in Germany he was entrusted with several honourable and difficult missions, which brought him into contact with the courts of Dresden, Vienna, Munich and Wurttemberg, as well as with Napoleon. It is, however, charged at one time during this period that he made his finances were disordered, and his private life not above suspicion. After the abolition of the States of the Church, he was treated by the French as a state prisoner, and lived for some years at the abbey of Monticelli, solacing himself with music and with bird-shooting, pastimes which he did not eschew even after his election as pope. In 1814 he was chosen to carry the pope's congratulations to Louis XVIII.; in 1816 he was created cardinal-priest of Santa Maria Maggiore, and appointed to the see of Sinigaglia, which he resigned in 1818. In 1820 Pius VII. gave him the distinguished post of cardinal deacon. On the 22nd of April, 1829, he was created cardinal-camerlengo. On the 3rd of November, 1829, he was elected pope by the zelanti on the 28th of September. His election had been facilitated because he was thought to be on the edge of the grave; but he unexpectedly rallied. His foreign policy, entrusted at first to Della Somaglia and then to the more able Bernetti, moved in general along lines laid down by Consalvi; and he negotiated certain cordonatauts very advantageous to the papacy. Personally most frugal, Leo reduced taxes, made justice less costly, and was able to find money for certain public improvements; yet he left the finances more confused than he had found them, and even the elaborate jubilee of 1825 did not really mend matters. His domestic policy was one of extreme reaction. He condemned the Bible societies, and under Jesus influence reorganized the educational system. Severe ghetto laws led many of the Jews to emigrate. He hunted down the Carbonari and the Freemasons; he took the strongest measures against political agitation in theatres. A well-nigh ubiquitous system of espionage, perhaps most fruitful when directed against official corruption, sapped the foundations of public confidence. Leo, temperamentally stern, hard-working in spite of bodily infirmity, died at Rome on the 20th of February.
The news was received by the populace with unconfined joy. He was succeeded by Pius VIII.

Leo XIII. (Giacchino Pecci) (1810-1903), pope from 1878 to 1903, reckoned the 257th successor of St Peter, was born at Carpineto on the 2nd of March 1810. His family was Sienese in origin, and his father, Colonel Domenico Pecci, had served in the army of Napoleon. His mother, Anna Prosperi, is said to have been a descendant of Rienzi, and was a member of the third order of St Francis. He and his elder brother Giuseppe (known as Cardinal Pecci) received their earliest education from the Jesuits at Viterbo, and completed their education in Rome. In the jubilee year 1825 he was selected by his fellow-students at the Collegium Romanum to head a delegation to Pope Leo XII., whose memory he subsequendy cherished, and whose name he associated with Wea health, consequent on an accident, prevented him from obtaining the highest academical honours, but he graduated as doctor in theology at the age of twenty-two, and then entered the Accademia dei Nobili Ecclesiastici, a college in which clergy of aristocratic birth are trained for the diplomatic service of the Roman Church.

Two years later Gregory XVI. appointed him a domestic prelate, and bestowed on him, by way of apprenticeship, various minor administrative offices. He was ordained priest on the 31st of December 1837, and a few weeks later was made apostolic delegate of the small papal territory of Benevento, where he had to deal with brigands and smugglers, who enjoyed the protection of some of the noble families of the district. His success here led to his appointment in 1841 as delegate of Perugia, which was at that time a centre of anti-papal secret societies.

This post he held for eighteen months only, but in that brief period he obtained a reputation as a social and municipal reformer. In 1843 he was sent as nuncio to Brussels, being first consecrated a bishop (19th February), with the title of archbishop of Damietta. 1843. He was sent as nuncio to Brussels, being first consecrated a bishop (19th February), with the title of archbishop of Damietta, during his three years’ residence at the Belgian capital.

While in Rome he would, at the request of King Leopold, have been created cardinal but for the death of Gregory XVI. Seven years later, 10th December 1853, he received the red hat from Pius IX. Meanwhile, and throughout his long episcopate of thirty-two years, he foreshadowed the zeal and the enlightened policy later to be displayed in the prolonged period of his pontificate, building and restoring many churches, striving to elevate the intellectual as well as the spiritual tone of his clergy, and showing in his pastoral letters an unusual regard for learning and for social reform. His position in Italy was similar to that of Bishop Duanloup in France; and as a diplomatist in the political sphere, by his close friendship with Sulpis, he was not altogether persona grata to Pius IX. But he protested energetically against the loss of the pope’s temporal power in 1870, against the confiscation of the property of the religious orders, and against the law of civil marriage established by the Italian government, and he refused to welcome Victor Emmanuel in his diocese.

Nevertheless, he remained in the comparative obscurity of his episcopal see until the death of Cardinal Antonelli; but in 1877, when the important papal office of camerlengo became vacant, Pius IX. appointed to it Cardinal Pecci, who thus returned to reside in Rome, with the prospect of having shortly responsible functions to perform during the vacancy of the Holy See, though the camerlengo was traditionally regarded as disqualified by his office from succeeding to the papal throne.

When Pius IX. died (7th February 1878) Cardinal Pecci was elected pope at the subsequent conclave with comparative unanimity, obtaining at the third scrutiny (20th February) forty-four out of sixty-one votes, or more than the requisite two-thirds majority. The conclave was remarkably free from political influences, the attention of Europe being at the time engrossed by the presence of a Russian army at the gates of Constantinople. It was said that the long pontificate of Pius IX. led some of the cardinals to vote for Pecci, since his age (within a few days of sixty-eight) and health warranted the expectation that his reign would be comparatively brief; but he had for years been known as one of the few ‘‘papable’’ cardinals; and although his long seclusion at Perugia had caused his name to be little known outside Italy, there was a general belief that the conclave had selected a man who was a prudent statesman as well as a devout churchman; and Newman (who created a cardinal in the year following) is reported to have said, ‘‘In the successor of Pius I recognize a depth of thought, a tenderness of heart, a winning simplicity, and a power answering to the name of Leo, which prevent me from lamenting that Pius is no longer here.’’

The second day after his election Pope Leo XIII. crossed the River incognito to his former residence in the Falconieri Palace to collect his papers, returning at once to the Vatican, where he continued to regard himself as ‘‘imprisoned’’ so long as the Italian government occupied the city of Rome. He was crowned in the Sistine Chapel 3rd March 1878, and at once began a reform of the papal household on austere and economic lines which found little favour with the entourage of the former pope. To fill posts near his own person he summoned certain of the Perugian clergy who had been trained under his own eye, and from the first he was less accessible than his predecessor had been, either in public or private audience. Externally uneventful as his life henceforth necessarily was, it was marked chiefly by the reception of distinguished personages and of numerous pilgrimages, often on a large scale, from all parts of the world, and by the issue of encyclical letters. The subject of theological training in the Roman Catholic clergy throughout the world, the rivalry of the schools, the dispute between Thomist and Sienese, Thomas Aquinas was his first care, and to this end he founded in Rome and endowed an academy bearing the great schoolman’s name, further devoting about £20,000 to the publication of a new and splendid edition of his works, the idea being that on this basis the later teaching of Catholic theologians and many of the speculations of modern thinkers could best be harmonized and brought into line. The study of Church history was next encouraged, and in August 1883 the pope addressed a letter to Cardinals de Luca, Pitra and Hergenrother, in which he made the remarkable concession that the Vatican archives and library might be placed at the disposal of persons qualified to compile manuals of history. His belief was that the Church would not suffer by the publication of documents. A man of literary taste and culture, familiar with the classics, a facile writer of Latin verses1 as well as of Ciceronian prose, he was as anxious that the Roman clergy should unite human science and literature with their theological studies as that the laity should be educated in the principles of religion; and to this end he established the Roman Pontifical College, a kind of voluntary school board, with members both lay and clerical; and the rivalry of the schools, by thus founded, ultimately obliged the state to include religious teaching in its curriculum. The numerous encyclicals by which the pontificate of Leo XIII. will always be distinguished were prepared and written by himself, but were submitted to the customary revision. The encyclical *Aeterni Patris* (4th August 1879) was

---

written in the defence of the philosophy of St Thomas Aquinas. In later ones, working on the principle that the Christian Church should superintend and direct every form of civil life, he dealt with the Christian constitution of states (Immortale Dei, 1st November 1889), with human liberty (Libertas, 20th June 1888), and with the condition of the working classes (Rerum novarum, 15th May 1891). This last was slightly tinged with modern socialism; it was described as "the social Magna Carta of Catholicism," and it won for Leo the name of "the workingman's pope." Translated into the chief modern languages, many thousands of copies were circulated among the working classes in Catholic countries. Other encyclicals, such as those on Christian marriage (Arcanum divinae sapientiae, 10th February 1886), on the Rosary (Supremi apostolatus officii, 1st September 1883, and Superiori anno, 5th September 1889), and on Freemasonry (Humanae genus, 20th April 1884), dealt with subjects on which his predecessor had been accustomed to pronounce allocations, and were on similar lines. It was the knowledge that in all points of religious faith and practice Leo XIII stood precisely where Pius IX had stood that served to render ineffectual others of his encyclicals, in which he dealt earnestly and effectively with matters in which orthodox Protestants had a sympathetic interest with him and might otherwise have lent an ear to his counsels. Such were the letters on the study of Holy Scripture (18th November 1893), and on the grandeur of Christendom (29th July 1888). The 29th July 1897 was a day of special anxiety for the return of England to the Roman Catholic fold, and addressed a letter ad Anglos, dated 14th April 1895. This he followed up by an encyclical on the unity of the Church (Satis cognitum, 20th June 1896); and the question of the validity of Anglican ordinations from the Roman Catholic point of view having been raised in Rome by Viscount Halifax, with whom the abbé Louis Duchesne and one or two other French priests were in sympathy, a commission was appointed to consider the subject, and on the 5th of September 1896 a condemnation of the Anglican form as theologically insufficient was issued, and was directed to be taken as final.

The establishment of a diocesan hierarchy in Scotland had been decided upon before the death of Pius IX, but the actual announcement of it was made by Leo XIII. On the 25th of July 1898 he addressed to the Scottish Catholic bishops a letter, in the course of which he said that "many of the Scottish people who do not agree with us in faith sincerely love the name of Christ and strive to ascertain His doctrine and to imitate His most holy example." The Irish and American bishops he reminded to Rome to consider certain matters of Home Rule and of "Americanism" respectively. In India he established a diocesan hierarchy, with seven archbishops, the archbishop of Goa taking precedence with the rank of patriarch.

With the government of Italy his general policy was to be as conciliatory as was consistent with his oath as pope never to surrender the "patrimony of St Peter"; but a moderate attitude was rendered difficult by partisans on either side in the press, each of whom claimed to represent his views. In 1879, addressing a congress of Catholic journalists in Rome, he exhorted them to uphold the necessity of the temporal power, and to proclaim to the world that the affairs of Italy would never prosper until it was restored; in 1887 he found it necessary to depurate the violence with which this doctrine was advocated in certain journals. A similar counsel of moderation was given to the Canadian press in connexion with the Manitoba school question in December 1897. The less conciliatory attitude towards the Italian government was resumed in an encyclical addressed to the Italian clergy (21st August 1898), in which he insisted on the duty of Italian Catholics to abstain from political life while the papacy remained in its "painful, precarious and intolerable position." And in January 1902, reversing the policy which had its inception in the encyclical, Rerum novarum, of 1891, and had further been developed ten years later in a letter to the Italian bishops entitled Graves de communi, the "Sacred Congregation of Extraordinary Ecclesiastical Affairs" issued instructions concerning "Christian Democracy in Italy," and that the popular Christian movement, which embraced in its programme a number of social reforms, such as factory laws for children, old-age pensions, a minimum wage in agricultural industries, an eight-hours' day, the revival of trade guilds, and the encouragement of Sunday rest, should divert its attention from all such things as savoured of novelty and devote its energies to the restoration of the temporal power. The reactionary policy thus indicated gave the impression that a similar aim underlay the appointment about the same date of a commission to inquire into Biblical studies; and in other minor matters Leo XIII. disappointed those who had looked to him for certain reforms in the devotional system of the Church. A revision of the breviary, which would have involved the omission of some of the less credible legends, came to nothing, while the recitation of the office in honour of the Santa Casa at Loreto was imposed on all the clergy. The worship of Mary, largely developed during the reign of Pius IX., received further stimulus from Leo; nor did he do anything during his pontificate to correct the superstitions connected with popular beliefs concerning relics and indulgences.

His policy towards all governments outside Italy was to support them wherever they represented social order; and it was with difficulty that he persuaded French Catholics to be reconciled with the French government. The German Kulturkampf, he said in an address to the Pope's Council in London, was ended by his exertions. In 1885 he successfully arbitrated between Germany and Spain in a dispute concerning the Caroling Islands. In Ireland he condemned the "Plan of Campaign" in 1886, but he conciliated the Nationalists by appointing Dr Walsh archbishop of Dublin. His hope that his support of the British government in Ireland would be followed by the establishment of formal diplomatic relations between the court of St James's and the Vatican was disappointed. But the jubilee of Queen Victoria in 1887 and the pope's priestly jubilee a few months later were the occasion of friendly intercourse between Rome and Windsor, Mgr. Russo Scilla coming to London as special papal envoy, and the duke of Norfolk being received at the Vatican as the bearer of the congratulations of the queen of England. Similar courtesies were exchanged during the jubilee of 1897, and again in March 1902, when Edward VII. sent the earl of Denbigh to Rome to congratulate Leo XIII. on reaching his ninety-third year and the twenty-fifth year of his pontificate. The visit of Edward VII. to Leo XIII. in April 1903 was a further proof of the friendliness between the English crown and the Vatican.

The appointment of Newman to the college of Cardinals in 1879 was regarded with approval throughout the English-speaking world, both on Newman's account and also as evidence that Leo XIII. had a wider horizon than his predecessor; and his similar recognition of two of the most distinguished "inopportunists" members of the Vatican council, Haynaln, archbishop of Kalocsa, and Prince Fürstenberg, archbishop of Olmitz, was even more noteworthy. Dupanloup doubtless have received the same honour had he not died shortly after Leo's accession. Döllinger the pope attempted to reconcile, but failed. He laboured much to bring about the reunion of the Oriental Churches with the see of Rome, establishing Catholic educational centres in Athens and in Constantinople with that end in view. He used his influence with the emperor of Russia, as also with the emperors of China and Japan and with the shah of Persia, to secure the free practice of their religion for Roman Catholics within their respective dominions. Among the canonizations and beatifications of his pontificate that of Sir Thomas More, author of Utopia, is memorable. His encyclical issued at Easter 1902, and described by himself as a kind of will, was mainly a reiteration of earlier condemnations of the Reformation, and of modern philosophical systems, which for their atheism and materialism he makes responsible for all existing moral and political disorders. Society, he earnestly pleaded, can only find salvation by a return to Christianity and to the fold of the Roman Catholic Church.

Grave and serious in manner, speaking slowly, but with
energetic gestures, simple and abstemious in his life—his daily bill of fare being reckoned as hardly costing a couple of francs—Leo XIII. distributed large sums in charity, and at his own charges placed costly astronomical instruments in the Vatican observatory, providing also accommodation and endowment for a staff of officials. He always showed the greatest interest in science and in literature, and he would have taken a position as a statesman of the first rank had he held office in any secular government. He may be reckoned the most illustrious pope since Benedict XIV., and under him the papacy acquired a prestige unknown since the middle ages. On the 3rd of March 1903 he celebrated his jubilee in St Peter's with more than usual pomp and splendour; he died on the 20th of July following.

His successor was Pius X.

**LEO I.**—V.

**LEO I.**—V.

The name of six emperors of the East.

**LEO I.**—V.

Leo I., variously surnamed *Thrax, Magnus and Makelles*, emperor of the East, 457-474, was born in Thrace about 400. From his position as military tribune he was raised to the throne by the soldiery and recognized both by senate and clergy; his coronation by the patriarch of Constantinople is said to have been the earliest instance of such a ceremony. Leo owed his elevation mainly to Aspar, the commander of the guards, who was descended by his Arianism from becoming emperor in his own person, but hoped to exercise a virtual autocracy through his former steward and dependant. But Leo, following the traditions of his predecessor Marcian, set himself to curtail the domination of the great nobles and repeatedly acted in defiance of Aspar. Thus he vigorously suppressed the Eutychian heresy in Egypt, and by exchanging his Germanic bodyguard for Isaurians removed the chief basis of Aspar's power. With the help of his generals Anthemius and Anastasius, he repelled invasions of the Huns into Dacia (466 and 468). In 467 Leo had Anthemius elected emperor of the West, and in concert with him equipped an armament of more than 1,100 ships and 100,000 men against the pirate empire of the Vandals in Africa. Through the remiss- ness of Leo's brother-in-law Basiliscus, who commanded the expedition, the fleet was surprised by the Vandal king, Genserik, and half of its vessels sunk or burnt (468). This failure was made a pretext by Leo for killing Aspar as a traitor (471), and Aspar's murder served the Goths in turn as an excuse for ravaging Thrace up to the Danube capital (471-472). The Goths had already been opposing the Emperor in Dacia (472). In 482 Leo I. was associated with himself his infant grandson, Leo II., who, however, survived him by only a few months. His surnames Magnus (Great) and Makelles (butcher) respectively reflect the attitude of the Orthodox and the Arians towards his religious policy.

Schenk, *Kaiser Leo III.* (Halle, 1886), and *Byzantinische Zeitschrift* (1896), v. 427-431; T. H. Hodgkin, *Italy and the Empire* (1892, &c.), bk. viii., chs. 11, 12. See also Iconoclasts.

**LEO IV.**—V.

Leo IV., called Chozar, succeeded his father, Constantine V., as emperor of the East in 775. In 776 he associated his young son, Constantine, with himself in the empire, and suppressed a rising led by his five step-brothers which broke out as a result of this proceeding. Leo was largely under the influence of his wife Irene (q.v.), and when he died in 780 he left her as the guardian of his successor, Constantine VI.

**LEO V.**—V.

Leo V., surnamed the *Armenian*, emperor of the East, 813-820, was a distinguished general of Nicephorus I. and Michael I. After rendering good service on behalf of the latter in a war with the Arabs (812), he was summoned in 813 to co-operate in a campaign against the Bulgarians. Taking advantage of the dis- affection prevalent among the troops, he left Michael in the lurch and took the throne for himself, which he maintained by what appears to have been a successful revolution against him. Leo justified his usurpation by repeatedly defeating the Bulgarians who had been contemplating the siege of Constantinople (814-817). By his vigorous measures of repression against the Paulicians and image-worshippers he roused considerable opposition, and after a conspiracy under his friend Michael Psellus had been foiled by the imprison- ment of its leader, he was assassinated in the palace chapel on Christmas Eve, 820.

LEO, BROTHER—LEO, H.

LEO VI, surnamed THE WISE and THE PHILOSOPHER, Byzantine emperor, 856-911. He was a weak-minded ruler, chiefly occupied with important wars with barbarians and struggles with churchmen. The chief event of his reign was the capture of Thessalonica (904) by Mahomedan pirates (described in \textit{The Capture of Thessalonica} by John Cameniata) under the renegade Leo of Tripolis. In Sicily and Lower Italy the imperial arms were unsuccessful, and the Bulgarian Symeon, who assumed the title of "Czar of the Bulgarians and autocrat of the Romaei" secured the independence of his church by the establishment of a patriarchate. Leo's somewhat absurd surname may be explained by the facts that he was less ignorant than the greater part of his contemporaries in church and state, that his education had been directed by the learned Photius, and that several books of prose and ecclesiastical science were composed by the pen of his master. To the imperial philosopher (Gibbon). His works include seventeen \textit{Oracluca}, in iambic verse, on the destinies of future emperors and patriarchs of Constantinople; thirty-three \textit{Orationes}, chiefly on theological subjects (such as church festivals); \textit{Basilica}, the completion of the digest of the laws of Justinian, begun by Basil I., the father of Leo; some epigrams in the Greek \textit{Anthology}; an iambic lament on the melancholy condition of the empire; and some palindromic verses, curiously called \textit{kapxiis} (crabs). The treatise on military tactics, attributed to him, is probably by Leo III., the Isaurian.

(\textit{J. H. F.})

LEO, BROTHER (d. c. 1270), the favourite disciple, secretary and confessor of St Francis of Assisi. The dates of his birth and of his becoming a Franciscan are not known; but he was one of the small group of most trusted companions of the saint during his last years. After Francis's death Leo took a leading part in the opposition to Elias: he it was who broke in pieces the marble box which Elias had set up for offerings for the completion of the basilica at Assisi. For this Elias had him scourged, and this outrage on St Francis's dearest disciple consolidated the opposition to Elias and brought about his deposition. Leo was the leader in the early stages of the struggle in the order for the maintenance of St Francis's ideas on strict poverty, and the chief inspirer of the tradition of the Spirituals on St Francis's life and teaching. The claim that he wrote the so-called \textit{Speculum perfectionis} cannot be allowed, but portions of it do not go back to him. A little volume of his writings has been published by Lemmeus (\textit{Scripta Irairis Leonis}, 1901). Leo assisted at St Clara's deathbed, 1253; after suffering many persecutions from the dominant party in the order he died at the Portiuncula in extreme old age.

All that is known concerning him is collected by Paul Sabatier in the modern edition \textit{Speculum perfectionis} (1772), \textit{St Francis and Franciscans}.

(\textit{E. C. B.})

LEO, HEINRICH (1799-1878), German historian, was born at Rudolstadt on the 19th of March 1799, his father being chaplain to the garrison there. His family, not of Italian origin— as he himself was inclined to believe on the strength of family tradition—but established in Lower Saxony so early as the 10th century, was typical of the German upper middle classes, and this fact, together with the strongly religious atmosphere in which he was brought up and his early enthusiasm for nature, largely determined the bent of his mind. The taste for history, however, early instilled into him by the eminent philologist Karl Wilhelm Götting (1793-1860), who in 1816 became a master at the Rudolstadt gymnasium. From 1816 to 1819 Leo studied at the universities of Breslau, Jena and Göttingen, devoting himself more especially to history, philology and theology. At this time the universities were still agitated by the Liberal and patriotic aspirations aroused by the War of Liberation; at Breslau Leo fell under the influence of Jahn, and joined the political gymnastic association (\textit{Turnverein}); at Jena he attached himself to the radical wing of the German Burschenschaft, the so-called "Black Band," under the leadership of Karl Follen. The murder of Kotzebue by Karl Sand, however, shocked him out of his extreme revolutionary views, and from this time he tended, under the influence of the writings of Hamann and Herder, more and more in the direction of conservatism and romanticism, until at last he ended, in a mood almost of pessimism, by attaching himself to the extreme right wing of the forces of reaction. So early as April 1819, at Göttingen, he had fallen under the influence of Karl Ludwig von Haller's \textit{Handbuch der allgemeinen Staatskunde} (1808), a text-book of the counter-Revolution. On the 11th of May 1820 he took his doctor's degree; in the same year he qualified as Privatdozent at the university of Erlangen. For this latter purpose he had chosen as his thesis the constitution of the free Lombard cities in the middle ages, the province in which he was destined to do most for the scientific study of history. His interest in it was greatly stimulated by a journey to Italy in 1823; in 1824 he returned to the subject, and, as the result, published in five volumes a work which he won the approval of Goethe; on the other hand, he fell into violent controversy with Ranke about questions connected with Italian history. Up to the revolutionary year 1830 his religious views had remained strongly tinged with rationalism, Hegel remaining his guide in religion as in practical politics and the treatment of history. It was not till 1838 that Leo's polemical work \textit{Die Heglungen} proclaimed his breach with the radical developments of the philosopher's later disciples; a breach which developed into opposition to the philosopher himself. Under the impression of the July revolution in Paris and of the orthodox and pietistic influences at Halle, Leo's political convictions were henceforth dominated by reactionary principles. As a friend of the Prussian "Camarilla" and of King Frederick William IV, he collaborated especially in the high conservative \textit{Politisches Wochenblatt}, which first appeared in 1831, as well as in the Evangelische Kirchenzeitung, the \textit{Kreuzzeitung} and the \textit{Volksblatt für Stadt und Land}. In all this he critic's leaned an inclination towards Catholicism; and Leo did actually glorify the counter-Reformation, e.g. in his \textit{History of the Netherlands} (2 vols. 1832-1833). His other historical works also, notably his \textit{Universalgeschichte} (6 vols., 1835-1844), display a very one-sided point of view. When, however, in connexion with the quarrel about the archbishopric of Cologne (1837), political Catholicism raised its head menacingly, Leo turned against it with extreme violence in his open letter (1838) to Goerres, its foremost champion. On the other hand, he took a lively part in the politico-religious controversies within the fold of Prussian Protestantism.

Leo was by nature highly excitable and almost insanely passionate, though at the same time strictly honourable, unselfish, and in private intercourse even gentle. During the last year of his life his mind suffered rapid decay, of which signs had been apparent so early as 1868. He died at Halle on the 24th of April 1878. In addition to the works already mentioned, he left behind an account of his early life (\textit{Meine Jugendzeit}, Gotha, 1880) which is of interest.

LOE, JOHANNES (c. 1404-1552), in Italian Giovanni di LEONE, usually called LEONE AFRICANUS, sometimes ELIEBER-TANUS (i.e. of Granada), and properly known among the Moors as Al Hassan Ibn Mahammed Al Wezzar Al Fasi, was the author of a Descrizione dell'Africa, or Africæ descriptio, which long ranked as the best authority on Mahomedan Africa. Born probably at Granada of a noble Moorish stock (his father was a landowner; an uncle of his appears as an envoy from Fez to Timbuktu), he received a great part of his education at Fez, and while still young began to travel widely in the Barbary States. In 1512 he trace him at Morocco, Tunis, Bugia and Constantine; in 1513 we find him returning from Tunis to Morocco; and before the close of the latter year he seems to have started on his famous Sudan and Sahara journeys (1513-1515) which brought him to Timbuktu, to many other regions of the Great Desert and the Niger basin (Guinea, Melli, Gogo, Walata, Aghadez, Waganga, Katsena, &c.), and apparently to Bornu and Songhai. When we next hear from him, in 1521 or 1522, he was probably visiting Egypt on the way; it is more uncertain when he visited the three Arabias (Deserta, Felix and Petraecos), Armenia and "Tartary" (the last term is perhaps satisfied by his stay at Tabriz). His three Egyptian journeys, immediately after the Turkish conquest, all probably fell between 1517 and 1520; on one of these he ascended the Nile from Cairo to Assuan. As he was returning from Egypt about 1520 he was captured by pirates near the island of Gerba, and was ultimately presented as a slave to Leo X. The pope discovered his merit, assigned him a pension, and having persuaded him to profess the Christian faith, stood sponsor at his baptism, and bestowed on him (as Ramusio says) his own names, Johannes and Leo. The new convert, having made himself acquainted with Latin and Italian, taught Arabic (among his pupils was Cardinal Egidio Antonini, bishop of Viterbo); he also wrote books in both the Christian tongues he had acquired. His Description of Africa was first, apparently, written in Arabic, but the primary text now remaining is that of the Italian version, issued by the author at Rome, on the 10th of March 1526, three years after Pope Leo's death, though originally undertaken at the latter's suggestion. The Moor seems to have lived in Rome for some time longer, but he returned to Africa some time before his death at Tunis in 1552; according to some, he renounced his Christianity and returned to Islam; but the later part of his career is obscure.

The Descrizione dell'Africa in its original Arabic MS. is said to have existed for some time in the library of Vincenzo Pinelli (1556-1560), first published, in 1557, by Giovanni Battista Ramusio in his Navigazioni et Viaggi (vol. I.) of 1556. This was reprinted in 1554, 1563, 1588, &c. In 1556 Jean Temporal executed at Lyons an admirable French version from the Italian (Historia descrittiva dell'Africa), and in the same year appeared at Antwerp both Christopher Plantin's and Jean Belliere's printed issues of Temporal's translation, and a new (very inaccurate) Latin version by Joannes Florianus, Ioannes Leonis Africani de totius Africae descriptione (Antwerp, 1556). The latter was reprinted in 1558, 1559 (Zürich), and 1632 (Leiden) under the designation of John Pory's Elizabethan English translation, made at the suggestion of Richard Hakluyt (A Geographical History of Africa, London, 1598). Pory's version was reissued, with notes, maps, &c., by Robert Browne and Edward Wells (3 vols., Hakluyt Society, London, 1866). An excellent German translation was made by Lorschbach, in the Italian, in 1805 (Johann Leo des Afrikaners Beschreibungen von Afrika, Herbom). See also Francois Moore's Traversiello nell'Africa (1755), containing a table of Leo's account of negro kingdoms. Heinrich Barth intended to have made a fresh version, with a commentary, but was prevented by death; as it is, his own great works on the Sudan are the best editions of the Descrizione dell'Africa.

Leo also wrote lives of the Arab physicians and philosophers (De virtutibus illustribus apud Arabes; see J. A. Fabricius, Bibltheca Græca, 1726, xiii. 259-298); a Spanish-Arabic vocabulary, now lost, having been consulted by the famous Hebrew physician, Jacob Mantino; a collection of Arabic epitaphs in Hamburg, and near Fez (the MS. of this Leo presented, it is said, to the brother of the king); and poems, also lost. It is stated, moreover, that Leo intended writing a history of the Mahomedan religion, an epitome of Mahomedan chronicles, and an account of his travels in Asia and Egypt. (C. R. B.)

LEO, LEONARDO (1604-1744), more correctly LIONARDO OROZNO SALVATORE DE LEO, Italian musical composer, was born on the 4th of August 1604 at S. Vito dei Normanni, near Brindisi. He became a student at the Conservatorio della Pietà dei Turchini at Naples in 1703, and was a pupil first of Provenzale and later of Nicola Fago. It has been supposed that he was a pupil of Pintini and Alessandro Scarlatti, but he could not possibly have studied with either of these composers, although he was undoubtedly influenced by their compositions. His earliest known work was a sacred drama, L'Infedelta abbattuta, performed by his fellow-students in 1712. In 1724 he produced, at the court theatre, an opera, Pistrate, which was much admired. He held various posts at the royal chapel, and continued to write for the stage, besides teaching at the conservatorio. After adding comic scenes to Gasparini's Bajazette in 1722 for performance at Naples, he composed a comic opera, La Meca scoperta, in Neapolitan dialect, in 1723. His most famous comic opera was Amor vuol sferzare (1739), better known as La Finta Frascatana, highly praised by Des Brosses. He was equally distinguished as a composer of serious opera, Demofoonte (1735), Parnace (1737) and L'Olimpiade (1737) being his most famous works in this branch, and is still better known as a composer of sacred music. He died of apoplexy on the 31st of October 1744 while engaged in the composition of new airs for a revival of La Finta Frascatana.

Leo was the first of the Neapolitan school to obtain a complete mastery over modern harmonic counterpoint. His sacred music is masterly and dignified, logical rather than passionate, and free from the sentimentality which disfigures the work of F. Durante and G. B. Pergolesi. His serious operas suffer from a coldness and severity of style, but in his comic operas he shows a keen sense of humour. His ensemble movements are spirited, but never worked up to a strong climax.

A fine and characteristic example of his sacred music is the Dixit Dominus in C, edited by C. V. Stanford and published by Novello. A number of songs from operas are accessible in modern editions.

LEO (The Lion), in astronomy, the fifth sign of the zodiac (q.v.), denoted by the symbol . It is also a constellation, mentioned by Eudoxus (4th century B.C.) and Aratus (3rd century B.C.). According to Greek mythology this constellation is the Nemean lion, which, after being killed by Hercules, was raised to the heavens by Jupiter in honour of Hercules. A part of Ptolemy's Leo is now known as Coma Berenices (q.v.). a Leonis, also known as Cor Leonis or the Lion's Heart, Regulus, Basiliscus, &c., is a very bright star of magnitude 1-23, and parallax 0-02", and proper motion 0-27" per annum. γ Leonis is a very fine orange-yellow binary star, of magnitudes 2 and 4, and period 400 years. i Leonis is a binary, composed of a 4th magnitude pale yellow star, and a 7th magnitude blue star. The Leonids are a meteoric swarm, appearing in November and radiating from this constellation (see METEOR.)

LEOBEN, a town in Styria, Austria, 44 m. N.W. of Graz by rail. Pop. (1900) 19,204. It is situated on the Mur, and part of the town, by walls and moats, is still Roman. It has a well-known academy of mining and a number of technical schools. Its extensive iron-works and trade in iron are a consequence of its position on the verge of the important lignite deposits of Upper Styria and in the neighbourhood of the iron mines and furnaces of Vorderberg and Eisenerz. On the 18th of April 1791 a preliminary peace was concluded here between Austria and France, which led to the treaty of Campo-Formio.

LEOBSCÜTZ (Bohemian Lubuszye), a town of Germany, in the Prussian province of Silisia, on the Zina, about 20 m. to the N.W. of Ratibor by rail. Pop. (1905) 12,700. It has a large trade in wool, flax and grain, its markets for these commodities being very numerous attended. The principal industries are malting, carriage-building, wool-spinning and glass-making. The town contains three Roman Catholic
LEOCHARES—LEÓN, L. P. DE

churches, a Protestant church, a synagogue, and a new town-hall and a gymnasium. Leobschütz existed in the 10th century, and from 1524 to 1623 was the capital of the principality of Jägerndorf.

See F. Trocka, Geschichte der Stadt Leobschütz (Leobschütz, 1892).

LEOCHARES, a Greek sculptor who worked with Scopas on the Mausoleum about 350 B.C. He executed statues of the family of Philip of Macedon, in gold and ivory, which were set up by that king in the Philippeum at Olympia. He also with Lysippus made a group in bronze at Delphi representing a lion-hunt of Alexander. Of this the base with an inscription was recently found. We hear of other statues by Leochares of Zeus, Apollo and Ares. The statue in the Vatican, representing Ganymede being carried away by an eagle, though considerably restored and poor in execution, so closely corresponds with Pliny's description of a group by Leochares that we are justified in considering it a copy of that group, especially as the Vatican statue shows all the characteristics of Attic 4th-century art. Pliny (N.H. 34. 70) writes: "Leochares made a group of an eagle aware whom it is carrying off in Ganymede and to whom it is bearing him; holding the body delicately in its claws, with his garment between." (For engraving see GREEK ART, Plate I. fig. 53.) The tree stem is skillfully used as a support; and the upward strain of the group is ably rendered. The close likeness both in pose and in size between the Ganymede and the well-known Apollo Belvidere has caused some modern archaeologists to assign the latter also to Leochares. With somewhat more confidence we may regard the fine statue of Alexander the Great at Munich as a copy of his gold and ivory portrait at Olympia.

LEOFRIC (d. 1057), earl of Mercia, was a son of Leofwine, earl of Mercia, and became earl at some date previous to 1032. Henceforth, being one of the three great earls of the realm, he took a leading part in public affairs. On the death of King Canute in 1035 he supported the claim of his son Harold to the throne of that of Harald Canute; and during the quarrel between Edward the Confessor and Earl Godwine in 1051 he played the part of a mediator. Through his efforts civil war was averted, and in accordance with his advice the settlement of the dispute was referred to the Witan. When he became earl of Mercia his direct rule seems to have been confined to Cheshire, Staffordshire, Shropshire and the borders of north Wales, and afterwards he extended the area of his earldom. As Chester was his principal residence and the seat of his government, he is sometimes called earl of Chester. Leofric died at Bromiley in Staffordshire on 31st of August 1057. His wife was Godgifu, famous in legend as Lady Godiva. Both husband and wife were noted as liberal benefactors to the church, among their foundations being the famous Benedictine monastery at Coventry. Leofric's son, Ælfgar, succeeded him as earl of Mercia.

See E. A. Freeman, The Norman Conquest, vols. i. and ii. (1877).

LEOMINSTER, a market-town and municipal borough in the Leominster parliamentary division of Herefordshire, England, in a rich agricultural country on the Lugg, 157 m. W.N.W. of London and 124 N. of Hereford on the Great Western and London & North-Western railways. Pop. (1901) 5826. Area, 8728 acres. Some fine old timber houses lend picturesqueuess to the wide streets. The parish church, of mixed architecture, including the Norman naves of the old priory church, and containing some of the most beautiful examples of window tracery in England, was restored in 1866, and enlarged by the addition of a south nave in 1879. The Butter Cross, a beautiful example of timber work of the date 1633, was removed when the town hall was building, and re-erected in the pleasure ground of the Grange. Trade is chiefly in agricultural produce, wool and cider, as the district is rich in orchards. Brewing (from the produce of local hop-gardens) and the manufacture of agricultural implements are also carried on. The town is under a mayor, four aldermen and twelve councillors.

Merewald, king of Mercia, is said to have founded a religious house in Leominster (Llanilien, Leofminstre, Lempectre) in 660, and a nunnery existed here until the Conquest, when the place became a royal demesne. It was granted by Henry I. to the monks of Reading, who built in it a cell of their abbey, and under whose protection the town grew up and was exempted from the sphere of the county and hundred courts. In 1339 it reverted to the crown; and in 1554 was incorporated, by a charter renewed in 1562, 1563, 1605, 1666, 1685 and 1786. The borough returned two members to the parliament of 1295 and to other parliaments, until by the Representation Act 1885 it lost one representative, and by the Redistribution of Seats Act 1885 separate representation. A fair was granted in the time of Henry II., and fairs in the seasons of Michaelmas and the feasts of St Philip and St James and of Edward the Confessor, in 1265, 1281 and 1290 respectively. Charters to the burghers authorized fairs on the days of St Peter and of St Simon and St Jude in 1554, on St Bartholomew's day in 1605, in Mid-lent week in 1665, and on the feast of the Purification and on the 2nd of May in 1685; these fairs have modern representatives. A market was held by the abbey by a grant of Henry I.; Friday is now market day. Leominster was famous for wool from the 13th to the 18th century. There were gilds of mercers, tailors, drapers, dyers and glovers in the 16th century. In 1835 the wool trade was said to be dead; and that of glove-making, which had been important, was diminishing. Hops and apples were grown in 1715.

See G. Townsend, The Town and Borough of Leominster (1863), and John Price, History and Topographical Account of Leominster and its Vicinity (Ludlow, 1715).

LEOMINSTER, a township of Worcester county, Massachusets, U.S.A., about 45 m. N.W. of Boston and about 30 m. N. by E. of Worcester. Pop. (1890) 7269; (1900) 12,302, of whom 2827 were foreign-born; (1910 census) 17,580. It is a broken, hilly district, 26-48 sq. m. in area, traversed by the Nashua river, crossed by the Northern Division of the New York, New Haven & Hartford railroad, and by the Fitchburg Division of the Boston & Maine, and connected with Boston, Worcester and other cities by interurban electric lines. Along the N.E. border and mostly in the township of Lunenburg are Whalom Lake and Whalom Park, popular pleasure resorts. The principal villages are Leominster, 5 m. S.E. of Fitchburg, and North Leominster; the two adjoin and are virtually one. According to the Special U.S. Census of Manufactures of 1905 the township had in that year a greater diversity of important manufacturing industries than any place of its size in the state, or, probably, in the United States; its 65 manufactories, with a capital of $3,973,776, and a product for the year valued at $7,501,720 (1900), more than twice that of 1890, produced celluloid and horn work (the manufacture of which is a more important industry here than elsewhere in the United States), celluloid combs, furniture, paper, buttons, pianos and piano-cases, children's carriages and sleds, stationery, leatherboard, worsted, woolen and cotton goods, shirts, paper boxes, &c. Leominster owns and operates its water-works. The township was formed from a part of Lancaster township in 1740.

LEÓN, LUIS PONCE DE (1527–1591), Spanish poet and mystic, was born at Belmonte de Cuenca, entered the university of Salamanca at the age of fourteen, and in 1544 joined the Augustinian order. In 1561 he obtained a theological chair at Salamanca, to which in 1571 was added that of sacred literature. He was denounced to the Inquisition for translating the book of the Canticles, and for criticizing the text of the Vulgate. He was consequently imprisoned at Valladolid from March 1572 till December 1576; the charges against him were then abandoned, and he was released with an admonition. He resided in Valladolid until 1580, and was professor of Biblical exegesis, and was again reported to the Inquisition in 1582, but without result. In 1583–1585 he published the three books of a celebrated mystic treatise, Los Nombres de Cristo, which he had written in prison. In 1583 also appeared the most popular of his prose works, a treatise entitled La Perfecta Casada, for the use of a lady newly married. Ten days before his death, which occurred at Madrigal on the 23rd of August 1591, he was elected vicar
general of the Augustinian order. Luis de León is not only the greatest of Spanish mystics; he is among the greatest of Spanish lyrical poets. His translations of Eurípides, Pindar, Virgil and Horace are singularly happy; his original pieces, whether devout like the ode De la vida del cielo, or secular like the ode A Salinas, are instinct with a serene sublimity unsurpassed in any literature, and their form is impeccable. Absorbed by less worldly interests, Fray Luis de León refrained from printing his poems, which were not issued till 1631, when Quevedo published them as a counterblast to culteranismo.

The best edition of Luis de León's works is that of Merino (6 vols., Madrid, 1810); the reprint (Madrid, 1885) by C. Mañoz Suárez is incorrect. The text of La Perfección Casa da vein was collected by Miss Elizabeth Wallace (Chicago, 1903). See Colección de documentos inéditos para la historia de España, vols. x.-xi.; F. H. Reusch, Luis de León und die spanische Inquisición (Bonn, 1873); M. Gutiérrez, Fray Luis de León y la filosofía española (Madrid, 1885); M. Menéndez y Pelayo, Estudios de crítica literaria (Madrid, 1893), Primera serie, pp. 1-72.

LEON, MOSES [Ben Shem-tob] DE (d. 1305), Jewish scholar, was born in Leon (Spain) in the middle of the 13th century and died at Arefael. His fame is due to his authorship of the most influential Kabbalistic work, the Zohar (see KABBALA), which was attributed to Simon b. Yoḥai, a Rabbi of the 2nd century. In modern times the discovery of the modernity of the Zohar has led to injustice to the author. Moses de Leon undoubtedly used old materials and out of them constructed a work of genius. The discredit into which he fell was due partly to the unedifying incidents of his personal career. He led a wandering life, and was more or less of an adventurer. But as to the greatness of his work, the profundity of his philosophy and the brilliance of his religious idealism, there can be no question.

LEON OF MODENA (1571-1648), Jewish scholar, was born in Venice, of a notable French family which had migrated to Italy after the expulsion of the Jews from France. He was a precocious child, but, as Graetz points out, his lack of stable character prevented his gifts from maturing. “He pursued all sorts of occupations to support himself, viz. those of preacher, teacher of Jews and Christians, reader of prayers, interpreter, writer, proof-reader, bookseller, broker, merchant, rabbi, musari, tailor, and manufacturer of amulets. Though he failed to rise to real distinction he earned a place by his criticism of the Talmud among those who prepared the way for the new learning in Judaism. One of Leon’s most effective works was his attack on the Kabbala (Ari Nohem, first published in 1840), for in it he demonstrated that the “Bible of the Kabbalists” (the Zohar) was a modern composition. He became best known, however, as the interpreter of Judaism to the Christian world. At the instance of an English nobleman he prepared an account of the religious customs of the Synagogue, Riti Ebraici (1637). This book was widely read by Christians; it was rendered into various languages, and in 1650 was translated into English by Edward Chilmead. At the time the Jewish question was coming to the fore in London, and Leon of Modena’s book did much to stimulate popular interest. He died at Venice.

See Graetz, History of the Jews (Eng. trans.), vol. v. ch. iii.; Jewish Encyclopedia, viii. 6; Geiger, Leon de Modena. (I. A.)

LEÓN, or LEÓN DE LAS ALDÁMILAS, a city of the state of Guanajuato, Mexico, 209 m. N.W. of the federal capital and 30 m. W. by N. of the city of Guanajuato. Pop. (1805) 90,078; (1900) 62,633, León ranking fourth in the latter year among the cities of Mexico. The Mexican Central gives it railway connexion with the national capital and other prominent cities of the Republic. León stands in a fertile plain on the banks of the Turbio, a tributary of the Rio Grande de Lerma, at an elevation of 386 ft. above sea-level and in the midst of very attractive surroundings. The country about León is considered to be one of the richest cereal-producing districts of Mexico. The city itself is subject to disastrous floods, sometimes leading to loss of life as well as damage to property, as in the great flood of 1884. León is essentially a manufacturing and commercial city; it has a cathedral and a theatre, the latter one of the largest and finest in the republic. The city is regularly built, with wide streets and numerous shady parks and gardens. It manufactures saddlery and other leather work, gold and silver embroideries, cotton and woolen goods, especially rebozos (long shawls), soap and cutlery. There are also tanneries and flour mills. The city has a considerable trade in wheat and flour. The first settlement of León occurred in 1552, but its formal foundation was in 1576, and it did not reach the dignity of a city until 1836.

LEON, the capital of the department of Leon, Nicaragua, an episcopal see, and the largest city in the republic, situated midway between Lake Managua and the Pacific Ocean, 50 m. N.W. of Managua, on the railway from that city to the Pacific port of Corinto. Pop. (1905) about 45,000, including the Indian town of Subtiaba. León covers a wide area, owing to its gardens and plantations. Its houses are usually one-storied, built of adobe and roofed with red tiles; its public buildings are among the finest in Central America. The massive and elaborately ornamented cathedral was built in the Renaissance style between 1746 and 1774; a Dominican church in Subtiaba is little less striking. The old (1678) and new (1873) episcopal palaces, the hospital, the university and the barracks (formerly a Franciscan monastery) are noteworthy examples of Spanish colonial architecture. León has a large general trade, and manufactures cotton and woollen fabrics, ice, cigars, boots, shoes and saddlery; its tanneries supply large quantities of cheap leather for export. But its population (about 60,000 in 1890) tends to decrease.

At the time of the Spanish conquest Subtiaba was the residence of the great cacique of Nagrado, and contained an important Indian temple. The city of León, founded by Francisco Hernández de Cordova in 1523, was originally situated at the head of the western bay of Lake Managua, and was not removed to its present position till 1670. Thomas Gage, who visited it in 1665, describes it as a splendid city; and in 1685 it yielded rich booty to William Dampier (q.v.). Until 1855 León was the capital of Nicaragua, although its great commercial rival Granada contested its claim to that position, and the jealousy between the two cities often resulted in bloodshed. León was identified with the interests of the democracy of Nicaragua, Granada with the clerical and aristocratic parties.

See NICARAGUA; E. G. Squier, Central America, vol. i. (1856); and T. Gage, Through Mexico, &c. (1865).

LEON, the name of a modern province and of an ancient kingdom, captaincy-general and province in north-western Spain. The modern province, founded in 1833, is bounded on the N. by Oviedo, N.E. by Santander, E. by Palencia, S. by Valladolid and Zamora and W. by Orense and Lugo. Pop. (1900) 356,083. Area, 5086 sq. m. The boundaries of the province on the north and west, formed respectively by the central ridge and southerly offshoots of the Cantabrian Mountains (q.v.), are strongly marked; towards the south-east the surface merges imperceptibly into the Castilian plateau, the line of demarcation being for the most part merely conventional. Leon belongs partly to the basins of the Duero or Douro (q.v.), these being separated by the Montañas de Leon, which extend in a continuous wall (with passes at Manzanal and Poncabezon) from north to west-south. To the north-west of the Montañas de Leon is the richly wooded pastoral and highland district known as the Vierzo, which in its lower valleys produces grain, fruit, and wine in abundance. The Tierra del Campo in the west of the province is fairly productive, but in need of irrigation. The whole province is sparsely peopled. Apart from agriculture, stock-raising and mining, its commerce and industries are unimportant. Cattle, mules, butter, leather, coal and iron are exported. The hills of Leon were worked for gold in the time of the Romans; iron is still obtained, and coal-mining developed considerably towards the close of the 19th century. The only towns with more than 5000 inhabitants in 1900 were Leon (15,580) and Astorga (5736). The main railway from Madrid to Corunna passes through the province, and there are branches from the city of Leon to Vierzo, Oviedo, and the Biscayan port of Gijon.
LEON—LEONARDO DA VINCI

At the time of the Roman conquest, the province was inhabited by the Vettones and Callaict; it afterwards formed part of Hispania Tarraconensis. Among the Christian kingdoms which arose in Spain as the Moorish invasion of the 8th century receded, Leon was one of the oldest. The title of king of Leon was first assumed by Ordoño in 913. Ferdinand I. (the Great) of Castile united the crowns of Castile and Leon in the 11th century; the two were again separated in the 12th, until a final union took place (1230) in the person of St Ferdinand. The limits of the kingdom varied with the vicissitudes of war, but roughly speaking it may be said to have embraced what are now the provinces of Leon, Palencia, Valladolid, Zamora and Salamanca. For a detailed account of this kingdom, see SPAIN: History. The captain-general of the province of Leon before 1833 included Leon, Zamora and Salamanca. The Leonese, or inhabitants of these three provinces, have less individuality, in character and physique, than the people of Galicia, Catalonia or Andalusia, who are quite distinct from what is usually regarded as the central or national Spanish type, i.e. the Castilian. The Leonese belong partly to the Castilian section of the Spanishiards, partly to the north-western section which includes the Galicians and Asturians. They have comparatively few of the Moorish traits which are so marked in the south and the north, and do not in any very marked degree dwell a curiously tribe, the Maragatos, sometimes considered to be a remnant of the original Celtiberian inhabitants. As a rule the Maragatos earn their living as muleteers or carriers; they wear a distinctive costume, mix as little as possible with their neighbours and do not marry outside their own tribe.

LEON, an episcopal see and the capital of the Spanish province of Leon, situated on a hill 2631 ft. above sea-level, in the angle made by the Turia and Bernesga, streams which unite on the south, and form the river Leon, a tributary of the Esla. Pop. (1900) 15,580. Leon is on the main railway from Madrid to Oviedo, and is connected with Astorga by a branch line. The older quarters of the city, which contain the cathedral and other medieval buildings, are surrounded by walls, and have lost little of their beauty and interest from the restoration carried out in the second half of the 19th century. During the same period new suburbs grew up outside the walls to house the industrial population which was attracted by the development of iron foundry and the manufacture of machinery, railway-plant, chemicals and leather. The churches and most of the palaces are mainly ecclesiastical in their character, and the new, which is industrial. The cathedral, founded in 1199 and only completed at the close of the 14th century, is built of a warm cream-colored stone, and is remarkable for simplicity, lightness and strength. It is one of the finest examples of Spanish Gothic, smaller, indeed, than the cathedrals of Burgos and Toledo, but exquisite in design and workmanship. The chapter library contains some valuable manuscripts. The collegiate church of San Isidoro was founded by Ferdinand I. of Castile in 1063 and consecrated in 1140. Its architecture is Romanesque. The church contains some fine plate, including the silver reliquary in which the bones of St Isidore of Seville are preserved, and a silver processional cross dating from the 16th century, which is one of the most beautiful in the country. The convent and church of San Marcos, planned in 1514 by Ferdinand the Catholic, founded by Charles V. in 1537, and consecrated in 1541, are Renaissance in style. They are built on the site of a hostel used by pilgrims on their way to Santiago de Compostela. The provincial museum occupies the chapter-house and contains the interesting Roman monuments. The lower part of the city walls consists of Roman masonry dating from the 3rd century. Other buildings are the high school, ecclesiastical seminaries, hospital, episcopal palace and municipal and provincial halls.

Leon (Arab. ليوان) owes its name to the Legio Septima Gemina of Galba, which, under the later emperors, had its headquarters here. About 540 Leon fell into the hands of the Gothic king Leovigild, and in 717 it capitulated to the Moors. Retaken about 742, it ultimately, in the beginning of the 10th century, became the capital of the kingdom of Leon (see SPAIN: History). About 966 it was taken by Almanzor, but on his death soon afterwards it reverted to the Spaniards. It was the seat of several ecclesiastical councils, the first of which was held under Alphonso V. in 1012 and the last in 1288.

LEONARDO DA VINCI (1452-1519), the great Italian painter, sculptor, architect, musician, mechanician, engineer and natural philosopher, was the son of a Florentine lawyer, born out of wedlock by a mother in a humble station, variously described as a peasant and as of gentle birth. The place of his birth was Vinci, a castello or fortified hill village in the Florentine territory near Empoli, from which his father's family derived its name. The Christian name of the father was Piero (the son of Antonio the son of Piero the son of Guido, all of whom had been men of law like their descendant). Leonardo's mother was called Catarina. Her relations with Ser Piero da Vinci seem to have come to an end almost immediately upon the birth of her son. She was soon afterwards married to one Accattabar di Piero del Vacca, of Vinci. Ser Piero on his part was four times married, and had by his last two wives nine sons and two daughters; but he had from the first acknowledged the boy Leonardo and brought him up in his own house, principally, no doubt, at Florence. In that city Ser Piero followed his profession with success, as notary to many of the chief families in 1478, and afterwards to the signory or governing council of the state. The boy was now sent to his marriage grew up into a youth of shining promise. To splendid beauty and activity of person he joined a winning charm of temper and manners, a tact for all societies, and an aptitude for all accomplishments. An inexhaustible intellectual energy and curiosity lay beneath this amiable surface. Among the multifarious pursuits to which the young Leonardo set his hand, the favourites at first were music, drawing and modelling. His father showed some of his drawings to an acquaintance, Andrea del Verrocchio, who at once recognized the boy's artistic vocation, and was selected by Ser Piero to be his master.

Verrocchio, although hardly one of the great creative or inventive forces in the art of his age at Florence, was a first-rate craftsman alike as goldsmith, sculptor and painter, and particularly distinguished as a teacher. In his studio Leonardo worked for several years (about 1470-1477) in the company of Lorenzo di Credi and other less celebrated pupils. Among his contemporaries he formed special ties of friendship with the painters the young Filippino Lippi and Pietro Perugino. He had soon learnt all that Verrocchio had taught him, and if, as seems to be the case, the head of the picture of Christ's Baptism described by the master for the monks of Vallobromba, the work in question is now in the Academy at Florence. According to Vasari the angel kneeling on the left, with a drapery over the right arm, was put in by Leonardo, and when Verrocchio saw it his sense of its superiority to his own work caused him to forswear painting for ever after. The latter part of the story is certainly false. The picture, originally painted in tempera, has suffered much from later repaints in oil, rendering exact judgment difficult. The most competent opinion inclines to acknowledge the hand of Leonardo, not only in the face of the angel, but also in parts of the drapery and of the landscape background. The work was probably done in or about 1470, when Leonardo was eighteen years old. By 1472 we find him enrolled in the lists of the painters' guild at Florence. Here he continued to live and work for ten or eleven years longer. Up till 1477 he is still spoken of as a pupil or apprentice of Verrocchio; but in that year he seems to have been sent abroad to study in the Magnificent, and to have worked as an independent artist under his patronage until 1482-1483. In 1478 we find him receiving an important commission from the signory, and in 1480 another from the monks of San Donato in Scopeto.

Leonardo was not one of those artists of the Renaissance who sought the means of reviving the ancient glories of art mainly in the imitation of ancient models. The antiques of the Medici gardens seem to have had little influence on him beyond that of generally stimulating his passion for perfection. By his own instincts he was an exclusive student of nature.
LEONARDO DA VINCI

From his earliest days he had flung himself upon that study with an unpremeditated ardour of delight and curiosity. In drawing from life he had early found the way to unite precision with freedom and fire—the subtlest accuracy of expressive definition with vital movement and rhythm of line—as no draughtsman had been able to unite them before. He was the first painter to recognize the play of light and shade as among the most significant and attractive of the world's appearances, the earlier schools having with one consent subordinated light and shade to colour and outline. Nor was he a student of the broad, usual, patent appearances only of the world; its fugitive, fantastic, unaccustomed appearances attracted him most of all. Strange shapes of hills and rocks, rare plants and animals, unusual faces and figures of men, questionable smiles and expressions, whether beautiful or grotesque, far-fetched objects and curiosities, were things he loved to pore upon and keep in memory. Neither did he stop at mere appearances of any kind, but, having stamped the image of things upon his brain, went on indefatigably to probe their hidden laws and causes. He soon satisfied himself that the artist who was content to reproduce the external aspects of things without searching into the hidden workings of nature behind them, was one but half equipped for his calling. Every fresh artistic problem immediately became for him a far-reaching scientific problem as well. The laws of light and shade, the laws of "perspective," including optics and the physiology of the eye, the laws of human and animal anatomy and muscular movement, those of the growth and structure of plants and of the powers and properties of water, all these and much more furnished food almost from the beginning to his insatiable spirit of inquiry.

The evidence of the young man's predilections and curiosities is contained in the legends which tell of lost works produced by him in youth. One of these was a cartoon or monochrome painting of Adam and Eve in tempera, and in this, besides the head of the second figure (the infinite truth and elaboration of the foliage and animals in the background are celebrated in terms which bring to mind the treatment of the subject by Albrecht Dürer in his famous engraving done thirty years later. Again, a peasant of Vinci having in his simplicity asked Ser Piero to get a picture painted for him on a wooden shield, the father is said to have laughingly handed on the commission to his son, who thereupon shut himself up with all the noxious insects and grotesque reptiles he could find, observed and drew and dissected them assiduously, and produced at last a picture of a dragon compounded of their various shapes and aspects, which was so fierce and so life-like as to terrify all who saw it. With equal research and no less effect he painted on another occasion the head of a snaky-haired Medusa. (A picture of this subject which long did duty at the Uffizi for Leonardo's work is in all likelihood merely the production of some later artist to whom the descriptions of that work have given the cue.) Lastly, Leonardo is related to have begun work in sculpture about this time by modelling several heads of smiling women and children.

Of certified and accepted paintings produced by the young genius, whether during his apprentice or his independent years at Florence (about 1470-1482), very few are extant, and the two most important are incomplete. A small and charming strip of an oblong "Annunciation" at the Louvre is generally accepted as his work, done soon after 1470; a very highly wrought drawing at the Uffizi, corresponding on a larger scale to the head of the Virgin in the same picture, seems rather to be a copy by a later hand. This little Louvre "Annunciation" is not very compatible in style with another and larger, much-debated "Annunciation" at the Uffizi, which manifestly came from the workshop of Verrocchio about 1473-1474, and which many writers, Benci and others, could hardly have been joint studio-work of Verrocchio and his pupils including Leonardo, who certainly was concerned in it, since a study for the sleeve of the angel, preserved at Christ Church, Oxford, is unquestionably by his hand. The landscape, with its mysterious spiry mountains and winding waters, is very Leonardoesque both in this picture and in another contemporary product of the workshop, or as some think of Leonardo's hand, namely a very highly and coldly finished small "Madonna with a Pink" at Munich. The likeness he is recorded to have painted of Ginevra de' Benci used to be traditionally identified with the fine portrait of a matron at the Pitti absurdly known as La Monaca; more lately it has been recognized in a rather dull, expressionless Verrocciosque portrait of a young woman with a fanciful background of pine-sprays in the Liechtenstein gallery at Vienna. Neither attribution can be counted convincing. Several works of sculpture, including a bas-relief at Pistoia and a small terra-cotta-model of a St John at the Victoria and Albert Museum, have also been claimed, but without general consent, as the young master's handiwork. Of many brilliant early drawings by him, the first that can be dated is a study of landscape done in 1473. A magnificent silver-point head of a Roman warrior at the British Museum was clearly done, from or for a bas-relief, under the immediate influence of Verrochio. A number of portraits of heads in pen or silver point, with some sketches for Madonnas, including a charming series in the British Museum for a "Madonna with the Cat," may belong to the same years or the first years of his independence. A sheet with two studies of heads bears a MS. note of 1478, saying that in one of the last months of that year he began painting the "Two Maries." One of the two may have been a picture of the Virgin appearing to St Bernhard, which we know he was commissioned to paint in that year for a chapel in the Palace of the Signory, but never finished: the commission was afterwards transferred to Filippino Lippi, whose performance is now in the Badia. One of the two heads on this dated sheet may probably have been a study for the same St Bernhard; it was used afterwards by some follower for a St Leonard in a stiff and vapid "Ascension of Christ," wrongly attributed to the master himself in the Berlin Museum. A pen-drawing representing a ringleader of the Pazzi conspiracy, Bernardo Baronzoni, hung out of a window of the Bargello after his surrender by the sword; at Constantino, a fresco of the Adoration of the Magi, can be dated from its subject as done in December 1470. A number of his best drawings of the next following years are preparatory pen-studies for an altarpiece of the "Adoration of the Magi," undertaken early in 1481 on the commission of the monks of S. Donato at Scopeto. The preparation in monochrome for this picture, a work of extraordinary power both of design and physiognomical expression, is preserved at the Uffizi, but the painting itself was never carried out, and after Leonardo's failure to fulfil his contract Filippino Lippi had once more to be employed in his place. Of equal or even more intense power, though of narrower scope, is an unfinished monochrome preparation for a St Jerome, found accidentally at Rome by Cardinal Fesch and now in the Vatican gallery; this also seems to belong to the first Florentine period, but is not mentioned in documents.

The tale of completed work for these twelve or fourteen years (1470-1483 or thereabouts) is thus very scanty. But it must be remembered that Leonardo was already full of projects in mechanics, hydraulics, architecture, and military and civil engineering, ardently feeling his way in the work of experimental study and observation in every branch of theoretical or applied science in which any beginning had been made in his age, as well as in some in which he was himself the first pioneer. He was full of new ideas concerning both the laws and the applications of mechanical forces. His architectural and engineering projects were of a daring which amazed even the fellow-citizens of Alberti and Brunelleschi. History presents few figures more attractive to the mind's eye than that of Leonardo during this period of his all-capable and dazzling youth. He did not indeed escape calumny, and was even denounced on a charge of immoral manners and an infatuation for the Virgin which may have nothing about him, as there was afterwards about Michelangelo, dark-tempered, secret or morose; he was open and genial with all men. He has indeed praised "the self-sufficing power of solitude" in almost the same phrase as Wordsworth, and from time to time would even in youth seclude himself for a season in complete intellectual absorption, as when he toiled among his...
bats and wasps and lizards, forgetful of rest and food, and insensible to the noisomeness of their corruption. But we have to picture him as anon coming out and gathering about him a tatterdemalion company, and jesting with them until they were in fits of laughter, for the sake of observing their burlesque physiognomies; anon as eagerly frequenting the society of men of science and learning of an older generation like the mathematician Benedetto Arimetrico, the physician, geographer and astronomer Paolo Toscanelli, the famous Greek Aristotelian Giovanni Argiropoulo; or as out-rivalling all the youth of the city now by charm of recitation, now by skill in music and now by feats of strength and horsemanship; or as stopping to buy caged birds in the market that he might set them free and watch them rejoicing in their flight; or again as standing radiant in his rose-coloured cloak and his rich gold hair among the throng of young and old on the piazza, and holding them spell-bound while he expatiated on the great projects in art and mechanics that were teeming in his mind. Unluckily it is to written records and to imagination that we have to trust exclusively for our picture. No portrait of Leonardo as he appeared during this period of his life has come down to us. For he hated to scheme in which he had no immediate gain, and diverted him from the tasks by which he should have supported himself. For all his shining power and promise he remained poor. Probably also his exclusive belief in experimental methods, and slight regard for mere authority whether in science or art made the intellectual atmosphere of the Medicean circle, with its passionate mixed cult of the classic past and of a Christianity mysteriously blended and reconciled with Platonism, uncongenial to him. At any rate he was ready to leave Florence when the chance was offered him of fixed service at the court of Ludovico Sforza (il Moro) at Milan. Soon after that prince had firmly established his power as nominal guardian and protector of his nephew Gian Galeazzo but really as usurping ruler of the state, he revived a project previously mooted for the erection of an equestrian monument in honour of the founder of his house's greatness, Francesco Sforza, and consulted Lorenzo dei Medici on the choice of an artist. Lorenzo recommended the young Leonardo, who went to Milan accordingly (at some uncertain date in or about 1483), taking as a gift from Lorenzo a letter in which he still preserved that sense of wondrous sweetness fashioned in the likeness of a horse's head. Hostilities were at the moment imminent between Milan and Venice; it was doubtless on that account that in the letter commending himself to the duke, and setting forth his own capacities, Leonardo restit his title to patronage chiefly on his attainments and inventions in military engineering. After asserting these in detail under nine different heads, he speaks under a tenth of his proficiency as a civil engineer and architect, and adds lastly a brief paragraph with reference to what he can do in painting and sculpture, undertaking in particular to carry out in a fitting manner the monument to Francesco Sforza.

The first definite documentary evidence of Leonardo's employments at Milan dates from 1487. Some biographers have supposed that the interval, or part of it, between 1483 and that date was occupied by travels in the East. The grounds of the supposition are some drafts occurring among his MSS. of a letter addressed to the diadario or diaddar of Syria, lieutenant of the sultan of Babylon (Babylon meaning according to a usage of that time Cairo). In these drafts Leonardo describes in the first person, with sketches, a traveller's strange experiences in Egypt, Cyprus, Constantinople, the Cilician coasts about Mount Taurus and Armenia. He relates the rise and persecution of a prophet and preacher, the catastrophe of a falling mountain and submersion of a great city, followed by a general inundation, and the claim of the prophet to have foretold these disasters; adding physical descriptions of the Euphrates river and the marvellous effects of sunset light on the Taurus range. No contemporary gives the least hint of Leonardo's having travelled in the East; to the places he mentions he gives their classical and not their current Oriental names; the catastrophes he describes are unattested from any other source; he confuses the Taurus and the Caucasus; some of the phenomena he mentions are repeated from Aristotle and Ptolemy; and there seems little reason to doubt that these passages in his MSS. are merely his drafts of a projected geographical treatise or perhaps romance. He had a passion for geography and travellers' tales, for descriptions of natural wonders and ruined cities, and was himself a practised fictitious narrator and fabulist, as other passages in his MSS. prove. Neither is the gap in the account of his doings after he first went to the court of Milan really so complete as has been represented. Ludovico was vehemently denounced and attacked during the earlier years of his usurpation, especially by the partisans of his sister-in-law Bona of Savoy, the mother of the rightful duke, young Gian Galeazzo. To repel these attacks he employed the talents of a number of court poets and artists, who in public recitation and pageant, in emblematic picture and banner and device, proclaimed the wisdom and kindness of his guardianship and the wickedness of his assailants. That Leonardo was among the artists thus employed is proved both by notes and projects among his MSS. and by allegoric sketches still extant. Several such sketches are at Christ Church, Oxford: one shows a horned hog or she-bear, and how the scheme brought him no immediate gain, and diverted him from the tasks by which he should have supported himself. For all his shining power and promise he remained poor.

But Ludovico, having decided in 1482 on the construction of a new palace, the Sforza Castle, and having resolved to make the court of Milan in every way worthy of the residence of a prince of the house of Visconti, who claimed to be the royal family of Italy, and to be the repository of the greater part of the ancient national treasure of Italy, set about the work of embellishment in a manner that would place it at the head of the works of the day. The order of Ludovico, the Genoese, to Leonardo was as follows:

Galeazzo) again called forth his powers as a masque and pageant-master. For the next following years the ever-increasing gaiety and splendour of the Milanese court gave him continual employment in similar kinds, including the composition and recitation of jests, tales, fables and "prophecies" (i.e. moral and social satires and allegories cast in the future tense); among his MSS. occur the drafts of many such, some of them both profound and pungent. Meanwhile he was again at work upon the monument to Francesco Sforza, and this time to practical purpose. When ambassadors from Austria came to Milan towards the close of 1493 to escort the betrothed bride of their emperor Maximilian, Bianca Maria Sforza, away on her nuptial journey, the finished colossal model, 26 ft. high, was at last in its place for all to see in the courtyard of the Castello. Contemporary accounts attest the magnificence of the work and the enthusiasm it excited, but are not precise enough to enable us to judge to which of the two main groups of extant sketches its design corresponded. One of these groups shows the horse and rider in relatively tranquil march, in the manner of the Gattamelata monument put up fifty years before by Donatello at Padua and the Colleoni monument on which Verrocchio was now engaged at Venice. Another group of sketches shows the horse galloping or rearing in violent action, in some instances in the act of trampling a fallen enemy. Neither is it possible to discriminate with certainty the sketches intended for the Sforza monument from others which Leonardo may have done in view of another and later commission for an equestrian statue, namely, that in honour of Ludovico's great enemy, Gian Giacomo Trivulzio.

The year 1494 is a momentous one in the history of Italian politics. In that year the long ousted and secluded prince, Gian Galeazzo, died under circumstances more than suspicious. In that year Ludovico, now Milan's right in, for the strengthening of his power against Naples, first entered into those intrigues with Charles VIII of France which later brought upon Italy successive floods of invasion, revolution and calamity. The same year was one of special importance in the prodigiously versatile activities of Leonardo da Vinci. He was anon at work amid among other things, planning during an absence of several months from the city vast new engineering works for improving the irrigation and water-ways of the Lomellina and adjacent regions of the Lombard plain; ardently studying phenomena of storm and lightning, of river action and of mountain structure; co-operating with his friend, Donato Bramante, the great architect, in fresh designs for the improvement and embellishment of the Castello at Milan; and petitioning the duke to secure him proper payment for a Madonna lately executed with the help of his pupil, Ambrogio de Predis, for the brotherhood of the Conception of St Francis at Milan. (This is almost certainly the fine, slightly altered second version of the "Virgin of the Rocks," now in the National Gallery, London. The original and earlier version is one of the glories of the Louvre, and shows far more of a Florentine and less of a Milanese character than the London picture. In the same year, 1494, or early the next year, Leonardo, if Vasari is to be believed, paid a visit to Florence to take part in deliberations concerning the projected new council-hall to be constructed in the palace of the Signory. Lastly, recent research has proved that it was in 1494 that Leonardo got to work in earnest on what was to prove not only by far his greatest but by far his most expeditiously and steadily executed work in painting. This was the "Last Supper" undertaken for the refectory of the convent church of Sta Maria delle Grazie at Milan on the joint commission (as it would appear) of Ludovico and of the monks themselves.

This picture, the world-famous "Cenacolo" of Leonardo, has been the subject of much erroneous legend and much misguided experiment. Having through centuries undergone cruel injury, from technical imperfections at the outset, from disastrous atmospheric conditions, from vandalism and neglect, and most of all from unskilled repair, its remains have at last (1904-1908) been treated with a mastery of scientific resource and a tenderness of conscientious skill that have revived for ourselves and for posterity a great part of its power. At the same time its true history has been investigated and re-established. The intensity of intellectual and manual application which Leonardo threw into the work is proved by the fact that he finished it within four years, in spite of all his other avocations and of those prolonged pauses of concentrated imaginative effort and intense self-critical brooding to which we have direct contemporary witness. He painted the picture on the wall in tempera, not, according to the legend which sprung up within twenty years of its completion, in oil. The tempera vehicle, perhaps including new experimental ingredients, did not long hold firmly to its plaster ground, nor that to the wall. Flaking and scaling set in; hard crusts of mildew formed, dissolved and re-formed with changes of weather over both the loosened parts and those that remained firm. Decade after decade these processes went on, a rain of minute scales and grains falling, according to one witness, continually from the surface, till the picture seemed to be perishing altogether. In the 18th century attempts were first made at restoration. They all proceeded on the false assumption, dating from the early years of the 16th century, that the work had been executed in oil. With oil it was accordingly at one time saturated in hopes of reviving the colours. Other experimenters tried various "secrets," which for the most part meant deleterious glues and varnishes. Fortunately not very much of actual repainting was accomplished except on some parts of the garments. The chief operations were carried on by Bellotti in 1726, by Mazza in 1770, and by Baretti in 1819 and the following years. None of them arrested, some actually accelerated, the natural agencies of damp and disintegration, decay and mildew. Yet this mere ghost of a picture, this evocation, half vanished as it was, by a great world-genius of a mighty spiritual world-event, remained a thing indescribably impressive. The ghost has now been brought back to much of true life again by the skill of the most scrupulous of all restorers, Cavaliere Cavenaghi, who, acting under the authority of a competent commission, and after long and patient experiment, found it possible to secure to the wall the innumerable blistered, mis-showed aspide flakes and scales of the original work that yet remained, to clear the surface thus obtained of much of the obliterating accretions due to decay and mishandling, and to bring the whole to unity by touching tenderly in with tempera the spots and spaces actually left bare. A further gain obtained through these operations has been the uncovering, immediately above the main subject, of a beautiful scheme of painted lunettes and vaultings, the lunettes filled by Leonardo's hand with inscribed scutcheons and interlaced plait or knot ornaments (intrecciamenti), the vaultings with stars on a blue ground. The total result, if adequate steps can be taken to counteract the effects of atmospheric change in future, will remain a splendid gain for posterity and a happy refutation of D'Annunzio's despairing poem, the Death of a Masterpiece.

Leonardo's "Last Supper," for all its injuries, became from the first, and has ever since remained, for all Christendom the typical representation of the scene. Goethe in his famous criticism has said all that needs to be said of this. The painter has departed from precedent in grouping the disciples, with their Master in the midst, along the far side and the two ends of a long, narrow table, and in leaving the near or service side of the table towards the spectator free. The chamber is seen in a perfectly symmetrical perspective, its rear wall pierced by three plain openings which admit the sense of quiet distance and mystery from the open landscape beyond; by the central of these openings, which is the widest of the three, the head and shoulders of the Saviour are framed in. On His right and left are ranged the disciples in equal numbers. The furniture and accessories of the chamber, very simply conceived, have been rendered with scrupulous exactness and distinctness; yet they leave to the human and dramatic elements the absolute mastery of the scene. The serenity of the holy company has within a moment been broken by the words of their Master, "One of you shall betray Me." In the agitation of their consciences and affections, the disciples have started into groups...
or clusters along the table, some standing, some still remaining seated. There are four of these groups, of three disciples each, and each group is harmoniously interlinked by some natural connecting action with the next. Leonardo, though no special student of the Greeks, has perfectly carried out the Greek principle of expressive variety in particulars subordinated to general symmetry. He has used all his acquired science of linear and aerial perspective to create an almost complete illusion to the eye, but an illusion that has in it nothing trivial, and in heightening our sense of the material reality of the scene only heightens its profound spiritual impressiveness and gravity. The results of his intensest meditations on the psychology and the human and divine significance of the event (on which he has left some pregnant hints in written words of his own) are perfectly fused with those of his subtlest technical calculations on the rhythmical balancing of groups and arrangement of figures in space.

Of authentic preparatory studies for this work there remain but few. There is a sheet at the Louvre of much earlier date than the first idea or commission for this particular picture, containing some nude sketches for the arrangement of the subject; another later and farther advanced, but still probably anterior to the practical commission, at the Munich sheet of great interest at the Victoria and Albert Museum, on which the painter has noted in writing the dramatic motives appropriate to the several disciples. At Windsor and Milan are a few finished studies in red chalk for the heads. A highly-reputed series of life-sized chalk drawings of the same heads, of which the greater portion is at Weimar, consists of early copies, and is interesting though having no just claim to originality. Scarcely less doubtful is the celebrated unfinished and injured study of the head of Christ at the Brera, Milan.

Leonardo's triumph with his "Last Supper" encouraged him in the hope of proceeding now to the casting of the Sforza monument or "Great Horse," the model of which had stood for the last three years the admiration of all beholders, in the Corte Vecchio of the Castello. He had formed a new and close friendship with Luca Pacioli of Borgo San Sepolcro, the great mathematician, whose "Summa de arithmetica, geometriae, &c.," he had eagerly bought at Pavia on its first appearance, and who arrived at the Court of Milan about the moment of the completion of the first version of the "Last Supper." Pacioli was equally amazed and delighted at Leonardo's two great achievements, and more interested and still more at the genius for mathematical, physical and anatomical research shown in the collections of MS. notes which the master laid before him. The two began working together on the materials for Pacioli's next book, "De divina proportione." Leonardo obtained Pacioli's help in calculations and measurements for the great task of casting the bronze horse and man. But he was soon called away by Ludovico to a different undertaking, the completion of the interior decorations, already begun by another hand and interrupted, of certain chambers of the Castello called the "Sala Negra" and the "Sala Grande dell' Asse, or Sala della Torre." When, in the last decade of the 15th century, works of thorough architectural investigation and repair were undertaken in that building under the superintendence of Professor Luca Beltrami, a devoted foreign student, Dr. Paul Müller-Walde, obtained leave to scrape for traces of Leonardo's handiwork beneath the repainted and whitewashed walls and ceilings of chambers that might be identified with these. Of one small chamber there was cleared a frieze of cupids intermingled with foliage; but in this, after the first moments of illusion, it was only possible to acknowledge the hand of some unknown late and lax decorator of the school, influenced as much by Raphael as by Leonardo. In another room ("Sala del Tesoro") was recovered a gigantic headless figure, in all probability of Mercury, also wrongly claimed at first for Leonardo, and afterwards, to all appearance rightly, for Bramante. But in the great "Sala dell' Asse" (or della Torre) abundant traces of Leonardo's own hand were found, in the shape of a decoration of intricate geometrical knot or plait work combined with natural leafage; the abstract puzzle-pattern, of a kind in which Leonardo took peculiar pleasure, intermingling in cunning play and contrast with a pattern of living boughs and leaves exquisitely drawn in free and vital growth. Sufficient portions of this design were found in good preservation to enable the whole to be accurately restored—a process as legitimate in such a case as censurable in the case of a figure-painting. For these and other artistic labours Leonardo was rewarded in 1498 (ready money being with difficulty forthcoming and his salary being long in arrears) by the gift of a suburban garden outside the Porta Vercelli.

But again he could not get leave to complete the task in hand. He was called away on duty as chief military engineer ("ingegnere camerale") with the special charge of inspecting and maintaining all the canals and waterways of the duchy. Dangers were accumulating upon Ludovico and the state of Milan. France had become Ludovico's enemy; and Louis XII., the pope and Venice had formed a league to divide his principality among them. He counted on baffling them by forming a counter league of the principalities of northern Italy, and by raising the Turks against Venice, and the Germans and Swiss against France. Germans and Swiss, however, inopportune for war against each other, Ludovico travelled to Innsbruck, the better to push his interests (September 1501). But his commission to Ludovico was already in effect, and the officers left in charge of the city surrendered it without striking a blow. The invading sovereign, going to Sta Maria delle Grazie with his retinue to admire the renowned painting of the "Last Supper," asked if it could not be detached from the wall and transported to France. The French lieutenant in Milan, Gian Giacomo Trivulzio, the embittered enemy of Ludovico, began exercising a vindictive tyranny over the city which had so long accepted the sway of the usurper. Great artists were usually exempt from the consequences of political revolutions, and Trivulzio, now or later, commissioned Leonardo to design an equestrian monument to himself. Leonardo, having remained un molested at Milan for two months under the new régime, but knowing that Ludovico was preparing a great stroke for the re-establishment of his power, and that fresh convulsions must ensue, thought it best to provide for his own security. In December he left Milan with his friend Luca Pacioli, having first sent some of his modest savings to Florence for investment. His intention was to watch events. They took a turn which made him a stranger to Milan for the next seven years. Ludovico, at the outbreak of a new arms race with theねvere, remained victorious. In February 1500, and was welcomed by a population disgusted with the oppression of the invaders. But in April he was once more overthrown by the French in a battle fought at Novara, his Swiss clamouring at the last moment for their overdue pay, and treacherously refusing to fight against a force of their own countrymen led by La Trémouille. Ludovico was taken prisoner and carried to France; the city, which had been strictly spared on the first entry of Louis XII., was entered and sacked; and the model of Leonardo's great statue made a butt (as eye witnesses tell) for Gascon archers. Two years later we find the duke Ercole of Ferrara begging the French king's lieutenant in Milan to let him have the model, injured as it was, for the adornment of his own city; but nothing came of the petition, and within a short time it seems to have been totally broken up.

Thus, of Leonardo's sixteen years' work at Milan (1483-1496) the results actually remaining are as follows: The Louvre "Virgin of the Rocks" possibly, i.e., as to its execution; the conception and style are essentially Florentine, carried out by Leonardo to a point of intense and almost glittering finish, of quintessential, almost overstrained, refinement in design and expression, and invested with a new element of romance by the landscape in which the scene is set—a strange watered country of basaltic caves and arches, with the lights and shadows striking sharply and yet mysteriously among rocks, some upright, some jutting, some pendent, all tufted here and there with exquisite growths of shrub and flower. The National Gallery "Virgin of the Rocks" certainly, with help from Ambrogio de Predis; in this the Florentine character of the original is modified by an admixture of Milanese elements, the tendency to harshness and
over-elaboration of detail softened, the strained action of the angel’s pointing hand altogether dropped, while in many places pupils’ work seems recognizable beside that of the master. The “Last Supper” of Sta Maria delle Grazie, his masterpiece; as to its history and present condition enough has been said. The decorations of the ceiling of the Sala della Torre in the Castello. Other paintings done by him at Milan are mentioned, and attempts have been made to identify them with works still existing. He is known to have painted portraits of two of the king’s mistresses, Cecilia Gallerani and Lucrezia Crivelli. Cecilia Gallerani used to be identified as a lady with ringslets and a lute, depicted in a portrait at Milan, now rightly assigned to Bartolommeo Veneto. More lately she has by some been conjecturally recognized in a doubtful, though Leonardoesque, portrait of a lady in the Sforzesco collection. The famous Lucrezia Crivelli has, with no better reason, been identified with the famous “Belle Ferronnère” (“a mere misnomer, caught from the true name of another portrait which used to hang near it) at the Louvre; this last is either a genuine Milanese portrait by Leonardo himself or an extraordinarily fine work of his pupil Boltraffio. Strong claims have also been made on behalf of a fine profile portrait resembling Beatrice d’Este in the Ambrosiana; but this the best judges are agreed in regarding as a work, done in a lucky hour, of Ambrogio di Predis. A portrait of a musician in the same gallery is in like manner contested between the master and the pupil. Mention is made of a “Nativity” painted for and sent to the emperor Maximilian, and also apparently of several portraits of famous foreign personages of the king of Hungary; both are lost or at least unidentified. The pupil, especially recorded as Leonardo’s immediate pupils during this part of his life at Milan are the two before mentioned, Giovanni Antonio Boltraffio and Ambrogio Preda or di Predis, with Marco d’Oggionno and Andrea Salai, the last apparently less a fully-trained painter than a studio assistant and personal attendant, devotedly attached and faithful in both capacities. Leonardo’s own native Florentine manner had at first been not a little modified by that of the Milanese school as he found it represented in the works of such men as Bramantino, Borgognone and Zanella; but his genius had in its turn reacted far more strongly upon the younger members of the school, and exercised, now or later, a transforming and dominating influence not only upon the numerous pupils but upon the artists of the same generation, Bazzi, Cesare da Sesto and indeed the whole Lombard school in the early 15th century. Of sculpture done by him during this period we have no remains, only the tragically tantalizing history of the Sforza monument. Of drawings there are very many, including few only for the “Last Supper,” many for the Sforza monument, as well as the multitude of sketches, scientific and other, which we find intermingled among the vast body of his miscellaneous MSS, notes and records. In mechanical, scientific and theoretical studies of all kinds it was a period, as these MSS attest, of extraordinary activity and self-development. At Pavia in 1494 we find him taking up literary and grammatical studies, both in Latin and the vernacular; the former with great success but the latter rather less, as he was already occupied with the ancient writers who had laboured in the fields that were his own, as Euclid, Galen, Celsius, Pliny, Vitruvius and, above all, Archimedes; the latter with a growing hope of some day getting into proper form and order the mass of materials he was daily accumulating for treatises on all his manifold subjects of enquiry. He had been much helped by his opportunities of intercourse with the great architects, engineers and mathematicians who frequented the court of Milan—Brantome, Alberghetti, Andrea di Ferrari, Pietro Monti, Fazio Cardano and, above all, Luca Pacioli. The knowledge of Leonardo’s position among and familiarity with such men early led to spread the idea that he had been at the head of a regularly constituted academy of arts and sciences at Milan. The occurrence of the words “Accade- mia Leonardo Vinci” on certain engravings, done after his drawings, of geometric “knots” or puzzle-patterns (for which we have already learned his partiality), helped to give currency to this impression not only in Italy but in the North, where the same engravings were copied by Albrecht Dürer. The whole notion has been proved mistaken. There existed no such academy at Milan, with Leonardo as president. The academies of the day represented the prevailing intellectual tendency of Renaissance humanism, namely, an absorbing enthusiasm for classic letters and for the transcendental speculations of Platonic and neo-Platonic mysticism, not unmixed with the traditions and practice of medieval alchemy, astrology and necromancy. For these last pursuits Leonardo had nothing but contempt. His many-sided and far-reaching studies in experimental science were mainly his own, conceived and carried out long in advance of his time, and in communion with only such more or less isolated spirits as were advancing along one or another of the same paths of knowledge. He learnt indeed on these lines eagerly wherever he heard, and learned what he could from knowledge to others. But he had no school in any proper sense except his studio, and his only scholars were those who painted there. Of these one or two, as we have evidence, tried their hands at engraving; among their engravings were these “knots,” which, being things of use for decorative craftsmen to copy, were inscribed for identification, and perhaps for protection, as coming from the Accademia Leonardo Vinci; a trifling matter altogether, and quite unfit to sustain the elaborate structure of conjecture which has been built on it.

To return to the master: when he and Luca Pacioli left Milan in December 1499, their destination was Venice. They made a brief stay at Mantua, where Leonardo was graciously received by the Marchioness Isabella Gonzaga, the most cultured of the many cultivated great ladies of her time, whose portrait he promised to paint on a future day; meantime he made the fine chalk drawing of her now at the Louvre. Arrived at Venice, he seems to have occupied himself chiefly with studies in mathematics and cosmography. In April the friends heard of the second and final overthrow of Ludovico il Moro, and at that news, giving up all idea of a return to Milan, moved on to Florence, which they found depressed both by internal troubles and by the protraction of the indecisive and inglorious war with Pisa. Here- Leonardo undertook to paint an altar-piece for the Church of the Annunziata, Filippo Lippi, who had already received the commission, courteously retiring from it in his favour. A year passed by, and no progress had been made with the work. Quidam, however, and among the many, urged Leonardo to engage him as much as ever. He writes to correspondents making enquiries about the tides in the Euxine and Caspian Seas. He reports for the information of the Arte de’ Mercanti on the precautions to be taken against a threatening landlip on the hill of S. Salvatore dell’ Osservanza. He submits drawings and models for the canalization and control of the waters of the Arno, and propounds, with compulsive eloquence and conviction, a scheme for transporting the Baptistry of St John, the “bel San Giovanni” of Dante, to another part of the city, and elevating it on a stately basement of marble. Meantime the Servite brothers of the Annunziata were growing impatient for the completion of their altar-piece. In April 1501 Leonardo had only finished the composition of his altarpiece and, he tells his friend and admirer, Isabella Gonzaga, who cherished the hope that he might be induced permanently to attach himself to the court of Mantua, wrote about this time to ask news of him, and to beg for a painting from him for her study, already adorned with masterpieces by the first hands of Italy, or at least for a “small Madonna, devout and sweet as is natural to him.” In reply her correspondent says that the master is wholly taken up with geometry and very impatient of the brush, but at the same time tells her all about his just completed cartoon for the Annunziata. The subject was the Virgin seated in the lap of St Anne, bending forward to hold her child who had half escaped from her embrace to play with a lamb upon the ground. The description answers exactly to the composition of the celebrated picture of the Virgin and St Anne at the Louvre. A cartoon of this composition in the Estherszky collection at Vienna is held to be only a copy, and the original cartoon must be regarded as lost. But another of kindred though not identical motive has come down to us.
LEONARDO DA VINCI

At Florence he was at last persuaded, on the initiative of Piero Soderini, to undertake for his native city a work of painting as great as that with which he had adorned Milan. This was a battle-piece to decorate one of the walls of the new council-hall in the palace of the signory. He chose an episode in the victory won by the generals of the republic in 1440 over Niccolo Piccinino near a bridge at Anghiari, in the upper valley of the Tiber. To the young Michelangelo was presently entrusted a rival battle-piece to be painted on another wall of the same apartment; he chose, as is well known, a surprise of the Florentine forces in the act of bathing near Pisa. About the same time Leonardo took part in the debate on the proper site for Michelangelo’s newly finished colossal “David,” and voted in favour of the Loggia dei Lanzi, against a majority which included Michelangelo himself. Neither Leonardo’s genius nor his noble manners could soften the rude and taunting temper of the younger man, whose style as an artist, nevertheless, in subjects both of tenderness and terror, underwent at this time a profound modification from Leonardo’s example.

In one of the sections of his projected Treateise on Painting, Leonardo has detailed at length, and obviously from his own observation, the pictorial aspects of a battle. His choice of subject in this instance was certainly not made from any love of warfare or indifference to its horrors. In his MSS. there occur almost as many trenchant sayings on life and human affairs as on art and natural law; and of war he has disposed in two words as a “bestial frenzy” (pazza bestialissima). In his design for the Hall of Council he set himself to depict this frenzy at its fiercest. He chose the moment of a terrific struggle for the colours between the opposing sides; hence the work became commonly known as the “Battle of the Standard.” Judging by the accounts of those who saw it, and the fragmentary evidences which remain, the tumultuous medley of men and horses, and the expressions of martial fury and despair, must have been rendered with a mastery which, combining as it did the looks and gestures of boded sorrow and soul’s perplexity among the quiet company on the convent wall at Milan. The place assigned to Leonardo for the preparation of his cartoon was the Sala del Papa at Santa Maria Novella. He for once worked steadily and unremittingly at his task. His accounts with the signory enable us to follow its progress step by step. He had finished the cartoon in less than two years (1504–1505), and when it was exhibited along with that of Michelangelo, the two rival works seemed to all men a new revelation of the powers of art, and served as a model and example of the students of that generation, as the frescoes of Masaccio in the Carmine had served to those of two generations earlier. The young Raphael, whose incomparable instinct for rhythmical design had been trained hitherto on subjects of holy piety and rapt contemplation according to the traditions of Umbrian art, learnt from Leonardo’s example to apply the same inspiration to themes of violent action and strife. From the same example Fra Bartolommeo and a crowd of other Florentine painters of the rising or risen generation took in like manner a new impulse. The master lost no time in proceeding to the execution of his design upon the mural surface; this time he had devised a technical method of which, after a preliminary trial in the Sala del Papa, he regarded the success as certain; the colours, whether tempera or other remains in doubt, were to be laid on a specially prepared ground, and then both colours and ground made secure upon the wall by the application of heat. When the central group was done the heat was applied, but it was found to take effect unequally; the colours in the upper part ran or scaled from the wall, and the result was a failure more or less complete. The unfinished and decayed painting remained for some fifty years on the wall, but after 1560 was covered over with new frescoes by Vasari. The cartoon did not last so long. After the work of the most inspiring of all examples for students it seems to have been cut up. When Leonardo left Italy for good in 1516 he is recorded to have left “the greater part of it” in deposit at the hospital of S. Maria Nuova, where he was accustomed also to deposit his
moneys, and whence it seems before long to have disappeared. Our only existing memorials of the great work are a number of small pen-and-ink studies of fighting men and horses, three splendid studies in red chalk at Budapest for heads in the principal group, one head at Oxford copied by a contemporary of the size of the original cartoon (above life); a tiny sketch, also at Oxford, by Raphael after the principal group; an engraving done by Zacchia of Lucca in 1558 not after the original but after a copy; a 16th-century Flemish drawing of the principal group, and another, splendidly spirited, by Rubens, both copies of copies; with Edelinck's fine engraving after the Rubens drawing.

During these years, 1503–1506, Leonardo also resumed (if it is true that he had already begun it before his travels with Cesare Borgia) the portrait of Madonna Lisa, the Neapolitan wife of Zanobi del Giocondo, and finished it to the last pitch of his powers. In this lady he had found a sitter whose face and smile possessed in a singular degree the haunting, enigmatic charm in which he delighted. He worked, it is said, at her portrait during some portion of four successive years, causing music to be played during the sittings that his rapt expression might not fail. The picture was bought afterwards by Francis I. for four thousand gold florins, and is now one of the glories of the Louvre. The richness of colouring on which Vasari expatiates has indeed flown, partly from injury, partly because in striving for effects of light and shade the painter was accustomed to model his figures on a dark ground, and in this as in his other oil-pictures the ground has to a large extent come through. Nevertheless, in its dimmed and blackened state, the portrait casts an irresistible spell alike by subtlety of expression, by refinement and precision of drawing, and by the romantic invention of its background. It has been the theme of endless critical rhapsodies, among which that of Pater is perhaps the most imaginative as it is the best known.

In the spring of 1506 Leonardo, moved perhaps by chagrin at the failure of his work in the Hall of Council, accepted a pressing invitation to Milan, from Charles d'Amboise, Maréchal de Chaumont, the lieutenant of the French king in Lombardy. The leave of absence granted to him by the signory on the request of the French viceroy was for three months only. The period was several times extended, at first grudgingly; Soderini complaining that Leonardo had treated the republic ill in the matter of the battle picture; whereupon the painter honourably offered to refund the money paid, an offer which the signory as honourably refused. Louis XII. sent messages urgently desiring that Leonardo should await his own arrival in Milan, having seen a small Madonna by him in France (probably that painted for Robertet) and hoping to obtain from him works of the same class and perhaps a portrait. The king arrived in May 1507, and soon afterwards Leonardo's services were formally and amicably transferred from the signory of Florence to Louis, who gave him the title of painter and engineer in ordinary. In September of the same year troublesome private affairs called him to Florence. His father had died in 1504, apparently intestate. After his death Leonardo experienced unhappiness from his seven half-brothers, Ser Piero's legitimate sons. They were all much younger than he, who followed his father's profession, made himself the champion of the others in disputing Leonardo's claim to his share, first in the paternal inheritance, and then in that which had been left to be divided between the brothers and sisters by an uncle. The litigation that ensued dragged on for several years, and forced upon Leonardo frequent visits to Florence and interruptions of his work at Milan, in spite of pressing letters to the authorities of the republic from Charles d'Amboise, from the French king himself, and from others of his powerful friends and patrons, begging that the proceedings might be accelerated. There are traces of work done during these intervals of compulsory residence at Florence. A sheet of sketches drawn there in 1508 shows the beginning of a Madonna now lost except in the form of copies, one of which (known as the "Madonna Litta") is at St Petersburg, another in the Feldi-Pezzoli Museum at Milan. A letter from Leonardo to Charles d'Amboise in 1511, announcing the end of his law troubles, speaks of two Madonnas of different sizes that he means to bring with him to Milan. One of them was no doubt that just mentioned; can the other have been the Louvre "Virgin with St Anne and St John," now at last completed from the cartoon exhibited in 1501? Meantime the master's main home and business were at Milan. Few works of painting and none of sculpture (unless the unfulfilled commission for the Trivulzio monument belongs to this time) are recorded as occupying him during the seven years of his second residence in that city (1506–1513). He had attached to himself a new and devoted young friend and pupil of noble birth, Francesco Melzi. At the villa of the Melzi family at Vaprio, where Leonardo was a frequent visitor, a colossal Madonna on one of the walls is traditionally ascribed to him, but is rather the work of Sodoma or of Melzi himself working under the master's eye. Another painter in the service of the French king, Jehan Perréal or Jehan de Paris, visited Milan, and consultations on technical points were held between him and Leonardo. But Leonardo's chief practical employments were evidently on the construction of his great hydraulic and irrigation works in Lombardy. His plan of a Perpetual Petition of scientific toys was revived on the occasion of Louis XII.'s triumphal entry after the victory of Agnadello in 1509, and gave intense delight to the French retinue of the king. He was consulted on the construction of new choir-stalls for the cathedral. He laboured in the natural sciences as ardently as ever, especially at anatomy in company with the famous professor of Pavia, Marcantonio della Torre. To about this time, when he was approaching his sixtieth year, may belong the noble portrait-drawing of himself in red chalk at Turin. He looks old for his years, but quite unbroken; the character of a veteran sage has fully imprinted itself on his countenance; the features are grand, clear and deeply lined, the mouth firmly set and almost stern, the eyes strong and intent beneath their bushy eyebrows, the hair flows untrimmed over his shoulders and comings with a majestic beard.

Returning to Milan with his law-suits ended in 1511, Leonardo moved his studio forward to an old age of contended labour, the chief task of which, had he had his will, would undoubtedly have been to put in order the vast mass of observations and speculations accumulated in his note-books, and to prepare some of them for publication. But as his star seemed rising that of his royal protector declined. The hold of the French on Lombardy was rudely shaken by hostile political powers, then confirmed again for a while by the victories of Gaston de Foix, and finally destroyed by the battle in which that hero fell under the walls of Ravenna. In June 1512 a coalition between Spain, Venice and the pope re-established the Sforza dynasty in power at Milan in the person of Ludovico's son Massimiliano. This prince must have been familiar with Leonardo as a child, but perhaps resentted the ready transfer of his allegiance to the French, and at any rate gave him no employment. Within a few months the ageing master uprooted himself from Milan, and moved with his chattels and retinue of pupils to Rome, into the service of the house that first befriended him, the Medici. The vast enterprises of Pope Julius II. had already made Rome the chief seat and centre of Italian art. The accession of Giulio de' Medici in 1513 under the title of Leo X. raised on all hands hopes of still ample and more sympathetic patronage. Leonardo's special friend at the papal court was the pope's youngest brother, Giuliano de' Medici, a youth who combined dissipated habits with thoughtful culture and a genuine interest in arts and sciences. By his influence Leonardo and his train were accommodated with apartments in the Belvedere of the Vatican. But the conditions of the time and place proved adverse. The young generation held the field. Michelangelo and Raphael, who had both, as we have seen, risen to greatness partly on Leonardo's shoulders, were fresh from the glory of their great achievements in the Sistine Chapel and the Stanze. Their rival factions hated each other, but both, especially the faction of Michelangelo, turned bitterly against the veteran
Among his visitors was a fellow-countryman, Cardinal Louis of Aragon, whose secretary has left an account of the day. Leonardo, it seems, was suffering from some form of slight paralysis which impaired his power of hand. But he showed the cardinal three pictures, the portrait of a Florentine lady done for Giuliano de' Medici (the Gioncoda?), the Virgin in the lap of St Anne (the Louvre picture; finished at Florence or Milan 1507-1513?), and a youthful John the Baptist. The last, which may have been done since he settled in France, is the darkened and partly repainted, but still powerful and haunting half-length figure in the Louvre, with the smile of inward ravishment and the prophetic finger beckoning skyward like that of St Anne in the Academy cartoon. Of the "Fornarina" mentioned by Lomazzo as a work of the Amboise time his visitor says nothing, nor yet of the Louvre "Bacchus," which tradition ascribes to Leonardo but which is clearly pupil's work. Besides pictures, the master seems also to have shown and explained to his visitors some of his vast store of notes and observations on anatomy and physics. He kept hoping to get some order among his papers, the accumulation of more than forty years, and perhaps to give the world some portion of the studies they contained. But his health was not good. On Easter Eve 1519, feeling that the end was near, he made his will. It made provision, as became a great servant of the most Christian king, for masses to be said and candles to be offered in three different churches of Amboise, first among them that of St Florentin, where he desired to be buried, as well as for sixty poor men to serve as torch-bearers at his funeral. Vasari babbles of a death-bed conversion and repentance. But Leonardo had never been either a friend or an enemy of the Church. Sometimes, indeed, he denounces fiercely enough the arts and pretensions of priests; but no one has embodied with such profound spiritual insight some of the most vital moments of the Christian story. His insatiable researches into natural fact brought upon him among the vulgar some suspicion of practising those magic arts which of all things he scouted and despised. The bent of his mind was all towards the teachings of experience and against those of authority, and laws of nature certainly occupied far more of his thoughts than dogmas of religion; but when he mentions these it is with respect as throwing light on the truth of things from a side which was not his own. His conformity at the end had in it nothing contradictory of his past. He received the sacraments of the Church and died on the 2nd of May 1519. King Francis, then at his court of St Germain-en-Laye, is said to have wept for the loss of such a servant; that he was present beside the death-bed and held the dying painter in his arms is a familiar but an untrue tale. After a temporary sepulture elsewhere his remains were transported on the 12th of August to the cloister of St Florentin according to his wish. He left all his MSS. and apparently all the contents of his studio, with other gifts, to the devoted Melzi, whom he named executor; to Salai and to his servant Battista Villanis a half each of his vineyard outside Milan; gifts of money and clothes to his maid Maturina; one of money to the poor of the hospital in Amboise; and to his unbrotherly half-brother a sum of four hundred ducats lying to his credit at Florence.

History tells of no man gifted in the same degree as Leonardo was at once for art and science. In art he was an inheritor and perfecter, born in a day of great and many-sided endeavours on which he put the crown, surpassing both predecessors and contemporaries. In science, on the other hand, he was a pioneer, working wholly for the future, and in great part alone. That the two stupendous gifts should in some degree neutralize each other was inevitable. No imaginable strength of any single man would have sufficed to carry out a hundredth part of what Leonardo essayed. The mere attempt to conquer the kingdom of light and shade for the art of painting was destined to tax the skill of generations, and is perhaps not wholly and finally accomplished yet. Leonardo sought to achieve that conquest and at the same time to carry the old Florentine excellences of linear drawing and psychological expression to a perfection of which other men
had not dreamed. The result, though marvellous in quality, is in quantity lamentably meagre. Knowing and doing allured him equally, and in art, which consists in doing, his efforts were often paralysed by his strained desire to know. The thirst for knowledge had first been aroused in him by the desire of perfecting the images of beauty and power which it was his business to create. Thence there grew upon him the passion of knowledge for its own sake. In the splendid balance of his nature the Virgilian longing, rerum cognoscere causas, could never indeed wholly silence the call to exercise his active powers. But the powers he cared most to exercise ceased by degree to be those of imaginative creation, and came to be those of turning to practical human use the mastery which his studies had taught him over the forces of nature. In science he was the first among modern men to set himself most of those problems which unnumbered searchers of later generations have laboured severally or in concert to solve. Florence had had other sons of comprehensive genius, artistic and mechanical, Leon Battista Alberti perhaps the chief. But the more the range and character of Leonardo's studies becomes ascertained the more his greatness dwarfs them all. A hundred years before Bacon, say those who can judge best, he showed a firmer grasp of the principles of experimental science than Bacon showed, fortified by a far wider range of actual observation and the methods which his genius from his youth assimilated. About one tenth of these point with surprising accuracy in the direction of truths established by later generations, but in the soundness, the wisdom, the tenacity of his methods lies his great title to glory. Had the Catholic reaction not fatally discouraged the pursuit of the natural sciences in Italy, had Leonardo even left behind him any one with zeal and knowledge enough to extract from the mass of his MSS. some portion of his labours in those sciences and give them to the world, an incalculable impulse would have been given to all those enquiries by which mankind has since been striving to understand the laws of its being and control the conditions of its environment,—to mathematics and astronomy, to mechanics, hydraulics, and physics generally, to geology, geography, and cosmology, to anatomy and the sciences of life. As it was, these studies of Leonardo—"studies intense of strong and stern delight."—seemed to his trivial followers and biographers merely his whims and fancies, ghiribizzi, things to be spoken of slighting and with apology. The MSS., with the single exception of some of those relating to painting, lay unheeded and undivulged until the present generation; and it is only now that the true range of Leonardo's power becomes fully displayed.

So much for the intellectual side of Leonardo's character and career. As a moral being we are less able to discern what he was like. The man who carried in his brain so many images of subtile beauty, as well as so much of the hidden science of the future, must have lived spiritually, in the same, alone. Of things communicable he was at the same time, as we have said, communicative—a genial companion, a generous and loyal friend, ready and eloquent of discourse, impressing all with whom he was brought in contact by the power and the charm of genius, and inspiring fervent devotion and attachment in friends and pupils. We see him living on terms of constant affection with his father, and in disputes with his brothers not the aggressor but the sufferer from aggression. We see him full of tenderness to animals, a virtue not common in Italy in spite of the example of St Francis; open-handed in giving, not eager in getting—"poor," he says, "is the man of many wants;" not prone to resentment—"the best shield against injustice is to double the cloak of long-suffering;" zealous in labour above all men—"as a day well spent gives joyful sleep, so does a life well spent give joyful death." With these instincts and maxims, and with his strength, granting it almost more than human, spent ever tunneling in abstruse mines of knowledge, his moral experience is not likely to have been deeply troubled. In religion, he regarded the faith of his age and country at least with imaginative sympathy and intellectual acquiescence, if no more. On the political storms which shook his country and drove him from one employ-ment to another, he seems to have looked not with the passionate participation of a Dante or a Michelangelo but rather with the serene detachment of a Goethe. In matters of the heart, if any cloudless space of happiness could be a chief part in his life, we do not know it; we know only (apart from the flashing shadows cast by calumny and envy) of affectionate and dignified relations with friends, patrons and pupils, of public and private regard mixed in the days of his youth with dazzled admiration, and in those of his age with something of reverential awe.

The Drawings of Leonardo.—These are among the greatest treasures ever given to the world by the human spirit expressing itself in pen and pencil. Apart from the many hundreds of illustrative pen-sketches scattered through his autobiographic and scientific MSS., the principal collection is at Windsor Castle (partly derived from Leonardo's original notebook collections, which were given to the British Museum; at Christ Church, Oxford; in the Louvre, at Chantilly, in the Uffizi, the Venice Academy, the Royal Library at Turin, the Museum of Budapest, and in the collections of M. Bonnat, Mrs Mond, and Captain Hollond). Leonardo's chief imitators were Papi, silver point, and red and black chalk (red chalk especially). In silver point there are many beautiful drawings of his earlier time, and some of his later; but of the charming heads of women and young men in this material attributed to him in various MSS., comparatively few are his own work, the majority being drawings in his spirit by his pupils Ambrogio Preda or Boltraffio. Leonardo appears to have been left-handed, There is some doubt on the point; but if correct, as is likely, the lower arm of his left hand is "indefatigable left hand;" all the best of his drawings are shaded downward from left to right, which would be the readiest way for a left-handed man; and his habitual eccentric practice of writing from right to left is much more familiar than have been due to natural arrangement. He expresses a desire of mystery presentment. A full critical discussion and catalogue of the extant drawings of Leonardo are to be found in Berenson's Drawings of the Florentine Painters.

The Writings of Leonardo.—The only printed book bearing Leonardo's name until the recent issues of transcripts from his MSS. was the celebrated Tretise on Painting (Trattato della pittura, Traité de la peinture). This consists of brief didactic chapters, or more properly a collection of disputations, on all the branches and conditions of a painter's practice. The original MS. draft of Leonardo has been lost, though a great number of pages for it are scattered through the various extant volumes of his MSS. This work has been divided by modern editors; these are an abridged version consisting of 365 sections; the first edition of it was published in Paris in 1551, by Raphael Dufresne, from a MS. which he found in the Barberini library; the last, translated into English by J. F. Rigaud, in 1802, contains an additional 125 sections, divided into eight books; this was printed in 1817 by Guglielmo Manzi at Rome, from two MSS. which he had discovered in the Vatican library; a German translation from the same MS. has been edited by G. H. Ludwig in Eitel'schen's edition of the Quattrocento (1859, 1862), and by Max Stuttgar, (1859). On the history of the book in general see Max Jordan, Das Malerbuch des Leonardo da Vinci (Leipzig, 1875). The unknown compilers of the Vatican MSS. must have had before them much of Leonardo's own written MSS. and some more or less extant versions. There is also a treatise on the art of the painter in the Uffizi collection (Cod. Inc. 94), which from the note-book in which it is written, Mr. Berenson makes it probable that it was written by Leonardo himself, about the middle of the 16th century; the members of a Milanese family called Mazzenta, into whose hands they passed in Orazio Melia's lifetime; and the sculptor Pompeo Leoni, who at one time entertained the design of procuring them for himself, and who in 1877 published a number of the note-books to form the great miscellaneous single volume called the Codice Atlantico, now at Milan. This volume, with a large proportion of the total number of other Leonardo MSS. then existing, passed into the hands of a Count Arundel, who in the meantime the earl of Arundel had made a vain attempt to purchase one of these volumes (the Codice Atlantico) at a great price for the king of England. Some stray parts of the collection, including a large part of the Uffizi possession, and the history of some others can be
followed; while much, it is evident, was lost for good. In 1796 Napoleon swept away to Paris, along with the other art treasures of Italy, the whole of the Leonardeschi MSS. at the Ambrosiana: only the Codice Atlantico was afterwards restored, the other volumes remaining the property of the Institute of France. These also had their adventures, two of them having been stolen by Count Libri and passed temporarily into the collection of Lord Ashburnham, whence they were in recent years made over again to the Institute. The publication of the Codice Atlantico towards the end of the 19th century was made by the beginning, in 1880, of the great series of publications from the MSS. of the Institute of France undertaken by C. Ravaisson-Mollon; the next by the publication in 1883 of Dr J. P. Richter’s Leonardo da Vinci (see Bibliography): this work included, besides the history enclosed in the Codice, a number of selected pages containing matter of autobiographical, artistic, or literary interest, with transcripts and translations of their MS. contexts. Since then much progress has been made in the publication of the MSS. of Leonardo, other, whether with adequate critical apparatus or in the form of mere facsimile without transliteration or comment.

A brief statement follows of the present distribution of the several MSS. of Leonardo, of the form in which they are generally published and quoted.

**England.**—*Windsor*: Nine MSS., chiefly on anatomy, published entire in simple facsimile by Rouveyre (Paris, 1901), partially, with biographical and introductory matter by Pumati and Sbalchikoff (Paris, 1897).—*Cambridge*: MSS. (MS. 1657, 1658, 1659) published under the title *The Library of Leonardo da Vinci in Cambridge* by the late W. R. O. Sinnwell (1905) (repr., 1906 in 3 vols.);—*Oxford*: a MS. prefixed, under the title *A Sketch of the Life of Leonardo da Vinci* (1907), by E. C. Rees, to the translation of the Codice Atlantico (11th ser. xiii, no. ii) by A. S. Roll (1907).—*Crawley*: MS. 561 in facsimile, published by Hendley (1907).—*London*: in the British Museum two MSS. are MS. (mailed) to the study of Leonardo by the late F. B. Moulton (1910).—*Brunswick*: MS. 22 published by Dr. F. von der Hagen (1911).—*AEon*, a MS. in facsimile (1911).—*Madrid*: a MS. (2nd ed., 1913) published by Ingegnoli. (Paris, 1913), the official account of the successful work of repair carried out by Signor Cavenagh in the preceding years; Woldeman von Seidlitz, Leonardo da Vinci, der Wendepunkt der Renaissance (2 vols., 1909), a comprehensive and careful work by an accomplished and veteran critic, inclined to give preference to successive manuscripts than to the Codice Atlantico, a single papyrus, Ambrogio Preda. It seems needless to give references to the voluminous discussion in newspapers and periodicals concerning the authenticity of a wax bust of Flora acquired in 1909 from a French dealer and attributed to Leonardo da Vinci, the real author having been proved by external and internal evidence to be the Englishman Richard Cocke Lucas, and its date 1846.

**LEONARDO OF PISA**

Italian mathematician of the 13th century. Of his personal history few particulars are known. His father was called Bonaccio, most probably a nickname with the ironical meaning of “a good, stupid fellow,” while to Leonardo himself another nickname, Bigollone (dunce, blockhead), seems to have been given. The father was secretary in one of the numerous factories erected on the southern and eastern coasts of the Mediterranean, and this may have made him migrate to France. Leonardo was educated at Buggia, and afterwards toured the Mediterranean. In 1202 he was again in Italy and published his great work, Liber abaci, which probably procured him access to the learned and refined court of the emperor Frederick II. Leonardo certainly was in relation with some persons belonging to that circle when he published in 1220 another more extensive work, De practica geometeria, which he dedicated to the imperial astronomer Dominicus Hispanus. Some years afterwards (perhaps in 1228) Leonardo dedicated to the well-known astrologer Michael Scott the second edition of his Liber abaci, which was printed with Leonardo’s other works by Prince Baldoncapi (Rome, 1857–1862, 2 vols.). The other works consist of the Practica geometriae and some of the most striking papers of the greatest scientific importance, amongst which the Liber quadratorum may be specially signalized. It bears the notice that the author wrote it in 1225, and in the introduction Leonardo tells us the occasion of its being written. Dominicus Hispanus addressed to Leonardo the following words: “Leonardo of Pisa was accompanied by a kind of mathematical performance, in which Leonardo solved several hard problems put to him by John of Palermo, an imperial notary, whose name is met with in several documents dated between 1221 and 1240. The methods which Leonardo made use of in solving those problems fill the Liber quadratorum, the Flos, and a Letter to Magister Theodore. All these treatises seem to have been written nearly at the same period, and certainly before the publication of the second edition of the Liber abaci, in which the Liber quadratorum is expressly mentioned. We know nothing of Leonardo’s fate after he issued that second edition.”

Leonardo’s works are mainly developments of the results obtained by his predecessors; the influences of Greek, Arabian, and Indian mathematicians can be traced in them. The methods. In his Practica geometriae plain traces of the use of the Roman numerals are met with; in his Liber abaci old Egyptian problems reveal their origin by the reappearance of the very numbers in which the problem is given, though one cannot guess through what channel they came. Leonardo, like Archimedes, was himself the inventor as the architect of that very great variety of truths for which he mentions no earlier source. The Liber abaci, which fills 459 printed pages, contains the most perfect methods of calculation and arithmetical traction, proportion, extraction of the square and cube roots, proportion, chain rule, finding of proportional parts, averages, progressions, even compound interest, just as in the complete mercantile arithmetics of our days. They teach further the solution of problems connected with equations of the first and second degree, to determine and indicate equations, not by single and double position only, but by real algebra, proved by means of geometric constructions, and including the use of letters as symbols for unknown numbers, the unknown quantity being called res and its square ceras.

**LEONARDO OF PISA**

Italian mathematician of the 13th century. Of his personal history few particulars are known. His father was called Bonaccio, most probably a nickname with the ironical meaning of “a good, stupid fellow,” while to Leonardo himself another nickname, Bigollone (dunce, blockhead), seems to have been given. The father was secretary in one of the numerous factories erected on the southern and eastern coasts of the Mediterranean, and this may have made him migrate to France. Leonardo was educated at Buggia, and afterwards toured the Mediterranean. In 1202 he was again in Italy and published his great work, Liber abaci, which probably procured him access to the learned and refined court of the emperor Frederick II. Leonardo certainly was in relation with some persons belonging to that circle when he published in 1220 another more extensive work, De practica geometeria, which he dedicated to the imperial astronomer Dominicus Hispanus. Some years afterwards (perhaps in 1228) Leonardo dedicated to the well-known astrologer Michael Scott the second edition of his Liber abaci, which was printed with Leonardo’s other works by Prince Baldoncapi (Rome, 1857–1862, 2 vols.). The other works consist of the Practica geometriae and some of the most striking papers of the greatest scientific importance, amongst which the Liber quadratorum may be specially signalized. It bears the notice that the author wrote it in 1225, and in the introduction Leonardo tells us the occasion of its being written. Dominicus Hispanus addressed to Leonardo the following words: “Leonardo of Pisa was accompanied by a kind of mathematical performance, in which Leonardo solved several hard problems put to him by John of Palermo, an imperial notary, whose name is met with in several documents dated between 1221 and 1240. The methods which Leonardo made use of in solving those problems fill the Liber quadratorum, the Flos, and a Letter to Magister Theodore. All these treatises seem to have been written nearly at the same period, and certainly before the publication of the second edition of the Liber abaci, in which the Liber quadratorum is expressly mentioned. We know nothing of Leonardo’s fate after he issued that second edition.”

Leonardo’s works are mainly developments of the results obtained by his predecessors; the influences of Greek, Arabian, and Indian mathematicians can be traced in them. The methods. In his Practica geometriae plain traces of the use of the Roman numerals are met with; in his Liber abaci old Egyptian problems reveal their origin by the reappearance of the very numbers in which the problem is given, though one cannot guess through what channel they came. Leonardo, like Archimedes, was himself the inventor as the architect of that very great variety of truths for which he mentions no earlier source. The Liber abaci, which fills 459 printed pages, contains the most perfect methods of calculation and arithmetical traction, proportion, extraction of the square and cube roots, proportion, chain rule, finding of proportional parts, averages, progressions, even compound interest, just as in the complete mercantile arithmetics of our days. They teach further the solution of problems connected with equations of the first and second degree, to determine and indicate equations, not by single and double position only, but by real algebra, proved by means of geometric constructions, and including the use of letters as symbols for unknown numbers, the unknown quantity being called res and its square ceras.
The second work of Leonardo, his Pratica geometrica (1220) requires readers already acquainted with Euclid’s plane geometry, who are able to follow rigorous demonstrations and feel the necessity for them. Among the contents of this book we simply mention a trigonometric method for finding the area of a triangle, the approximate extraction of cube roots shown more at large than in the Liber abaci, and a very curious problem, which nobody would search for in a geometrical work, viz.—To find a square number remaining when 5 is subtracted from it. This problem suggests the first question, viz.—To find a square number which remains a square after the addition and subtraction of 5, put to our mathematician in possession of the emperor by John of Palermo, who, perhaps, was eager to make him try to solve a problem only that he had himself asked for. Leonardo gave as solution the numbers 11, 16, 17, 66, 67, 121, 144, and 21, and the method of finding them is given in the Liber quadraturarum. We observe, however, that the solution of problems belonging to the new field, which already had found three square numbers of equal proposition, but the difference itself had not been assigned in the question. Leonardo’s method, therefore, when the difference was a fixed condition of the problem, was necessarily different from the Arabian, and, in all probability, was his own discovery. The Flora of Leonardo turns on the second question set by John of Palermo, which required the solution of the cubic equation \(x^3 + ax^2 + bx = c\), Leonardo, making use of fractions of the sexagonal magic square, gives as solutions \(a, 2b\) and \(c\) (after having demonstrated, by a discussion founded on the 10th book of Euclid, that a solution by square roots is impossible. It is true that this may be explained that Leonardo does not give the least intimation how he found the result, but we need not go so far as this to the 16th century. Genocchi believes Leonardo to have been in possession of a certain method called regula aurea by H. Cardan in the 16th century, but this is a mere hypothesis without solid foundation. In the treatise on the solution of cubic equations the values of the unknown quantities are also to be met with, and Leonardo perfectly understands the meaning of these negative solutions. In the Letter to Magister Theodore indeterminate problems are chiefly worked, and Leonardo hints at a method for solving any problem of this kind not exceeding the first degree.

As for the influence he exercised on posterity, it is enough to say that Luca Pacioli, about 1500, in his celebrated Summa, leaves so exclusive of Leonardo’s works, as to be known (only) that he frankly acknowledges his dependence on it, and that wherever no other author is quoted he always alludes to Leonardo Pisano.

Fibonacci’s series is a sequence of numbers such that any term is the sum of the two preceding terms; also known as Lamé’s series. 

Leoncavallo, Ruggiero (1858– ). Italian operatic composer, born at Naples and educated for music at the conservatoire. After some years spent in teaching and in ineffectual attempts to obtain the production of more than one opera, his Pagliacci was performed at Milan in 1892 with immediate success; and next year his Medici was also produced there. But neither the latter nor Chatterton (1856)—both early works—obtained any favour; and it was not till La Bohème was performed in 1897 at Venice that his talent obtained public confirmation. Subsequent operas by Leoncavallo were Zaza (1900), and Der Roland (1904). In all these operas he was his own librettist.

Leonidas, king of Sparta, the seventeenth of the Agiad line. He succeeded, probably in 489 or 488 B.C., his half-brother Cleomenes, whose daughter Gorgo he married. In 480 he was sent with about 7000 men to hold the pass of Thermopylae against the army of Xerxes. The smallness of the force was, according to a current story, due to the fact that he was deliberately going to his doom, an oracle having foretold that Sparta could be saved only by the death of one of its kings: in reality it seems rather that the ephebes supported the scheme half-heartedly, their policy being to concentrate the Greek forces at the Isthmus. Leonidas repulsed the frontal attacks of the Persians, but when the Malian Ephialtes led the Persian general Hydarnes by a mountain track to the rear of the Greeks he divided his army, himself remaining in the pass with 300 Spartiates, 700 Thespians and 400 Thebans. Perhaps he hoped to surround Hydarnes’ force; if so, the movement failed, and the Persians, who now attacked from both sides, were cut off by a man saving the Thebans, who are said to have surrendered. Leonidas fell in the thickest of the fight; his head was afterwards cut off by Xerxes’ order and his body crucified. Our knowledge of the circumstances it too slight to enable us to judge of Leonidas’ strategy, but his heroism and devotion secured him an almost unique place in the imagination not only of his own but also of succeeding times.

Leontiasis Ossea, a rare disease characterized by an overgrowth of the facial and cranial bones. The common form is that in which one or other maxilla is affected, its size progressively increasing both regularly and irregularly, and thus encroaching on the cavities of the orbit, the mouth, the nose and its accessory sinuses. Exophthalmos gradually develops, going on later to a complete loss of sight due to compression of the optic nerve by the overgrowth of bone. There may also be interference with the nasal respiration and with the taking of food. In the somewhat less common form of this rare disease the overgrowth of bone affects all the cranial bones as well as those of the face, the sinuses being filled with bone; there is also interference with the cerebral pressure, and there is no treatment other than exposing the overgrown bone, and chipping away pieces, or excising the entire mass if possible.

Leonfili, (mod. Lenfili), an ancient town in the south-east of Sicily, 22 m. N.N.W. of Syracuse direct, founded by Chalcidians from Naxos in 729 B.C. It is almost the only Greek settlement not on the coast, from which it is 6 m. distant. The site, originally held by the Sicels, was seized by the Greeks owing to its command of the fertile plain on the north. It was reduced to subjection in 408 B.C. by Hippocrates of Gela, and in 476 Hieron of Syracuse established here the inhabitants of Catana and Naxos. Later on Leonfili regained its independence, but in its efforts to retain it, the intervention of Athens was more than once invoked. It was mainly the eloquence of Gorgias (p. 92) of Leonfili which led to the abortive Athenian expedition of 427. In 422 Syracuse supported the oligarchs against the people and declared them as citizens, Leonfili itself being forsaken. This led to renewed Athenian intervention, at first mainly diplomatic; but the exiles of Leonfili joined the envos of Segesta in persuading Athens to undertake the great expedition of 415. After its failure, Leonfili became subject to Syracuse once more (see Strabo vi. 272). Its independence was guaranteed by the treaty of 405 between Dionysius and the Carthaginians, but it very soon lost it again. It was finally stormed by M. Claudius Marcellus in 214 B.C. In Roman times it seems to have been of small importance. It was destroyed by the Saracens A.D. 843, and almost totally ruined by the earthquake of 1698. The ancient city is described by Polybius (vii. 6) as lying in a bay between two hills, and facing north. On the western side of this bottom ran a river with a row of houses on its western bank under the hill. At each end was a gate, the northern one being by the modern southeastern entrance to the modern Syracuse. There was an acropolis on each side of the valley, which lies between precipitous hills with flat tops, over which buildings had extended. The eastern hill still has considerable remains of a strongly fortified medieval castle, in which some writers are inclined (though wrongly) to recognize portions of Greek masonry. See G. M. Columbia, in Archeologia di Leonfili (Palermo, 1891),, reprinted from Archivio Storico Siciliano, xi; P. Orsi in Römische Mitteilungen (1900), 61 seq. Excavations were made in 1899 in one of the ravines in a Sicel necropolis of the third period; explorations in the various Greek cemeteries resulted in finding some fine bronzes, notably a fine bronze lebes, now in the Berlin museum. (T. A. B.)

4 As a fact there are two flat valleys, up both of which the modern Lenfili extends; and hence there is difficulty in fitting Polybius’s account to the site.
LEONTIUS—LEOPARDI

LEONTIUS, theological writer, born at Byzantium, flourished during the 6th century. He is variously styled Byzantius, Hierosolymitanus (as an inmate of the monastery of St Saba near Jerusalem) and Scholasticus (the first “schoolman,” as the introducer of the Aristotelian definitions into theology; according to others, he had been an advocate, a special meaning of the word scholasticus). He himself states that in his early years he belonged to a Nestorian community. Nothing else is known of his life; he is frequently confused with others of the same name, and it is uncertain which of the works bearing the name Leontius are really by him. Most scholars regard as genuine the polemical treatises Contra Nestorianos et Eutychianos, Contra Nestorios, Contra Monophysitae, Contra Severum (patriarch of Antioch); and the Συγνώμη, generally called De Sectis. An essay Adversus fraudes Apollinarisistarum and two homilies are referred to other hands, the homilies to a Leontius, presbyter of Constantinople.

Collected works in J. P. Migne, Patrologia Graecae, lxxvi.; for the various questions connected with Leontius see P. Loos, Das Leben und die polemischen Werke des Leontius von Byzanz (Leipzig, 1887); W. Rügamer, Leontius von Byzanz (1894); V. Ermoni, De Leontio Byzantino (Paris, 1895); C. Krumbacher, Geschichte der byzantinischen Literatur (1897); J. P. Junglas, Leontius von Byzanz (1908). For other persons of the name see Fabriacus, Bibliotheca Graeca (ed. Harles), viii. 323.

LEOPARD, PARD or PANTHER (Felis pardus), the largest spotted true cat of the Old World, with the exception of the snow-leopard, which is, however, inferior in point of size to the largest leopard. (See CARNIVORA and SNOW-LEOPARD.) Leopards, known in India as cheeta (chita), are characterized by the rosette-like form of the black spots on the greater part of the body, and the absence of a central spot from each rosette. Towards the head and on the limbs the spots tend to become solid, but there is great local variation in regard to their form and arrangement. In the Indian leopard, the true Felis pardus, the spots are large and splotch-like, and the same is the case with the long-haired Persian leopard (F. pardus tulliana). On the other hand the heavily built and thick-haired Manchurian F. p. villosa has more consolidated spots. African leopards, again, to one of which the name F. p. leopardus is applicable, show a decided tendency to a breaking-up of the spots; West African animals being much darker-colored than those from the east side of the continent.

Both as regards structure and habits, the leopard may be reckoned as one of the more typical representatives of the genus Felis, belonging to that section in which the hyoid bone is loosely connected with the skull, owing to imperfect ossification of its anterior arch, and the pupil of the eye when contracted under the influence of light is circular, not linear as in the smaller cats.

The size of leopards varies greatly, the head and body usually measuring from 3'3 to 4' ft. in length, and the tail from 2' to 3' ft., but some specimens exceed these limits, while the Somali leopard (F. p. nozioi) falls considerably short of them. The ground-colour of the fur varies from a pale fawn to a rufous buff, graduating in the Indian race into pure white on the under-parts and inside of the limbs. Generally speaking, the spots on the under parts and limbs are simple and blacker than those on the other parts of the body. The bases of the ears behind are black, the tips buff. The upper side of the tail is buff, spotted with broken rings like the back, its under surface white with simple spots. The hair of the cubs is longer than that of the adults, its ground-colour less bright, and its spots less distinct. Perfectly black leopards, which in certain lights show the characteristic markings on the fur, are not uncommon, and are examples of melanism, occurring as individual variations, sometimes in one cub out of a litter of which the rest are normally coloured, and therefore not indicating a distinct race, much less a species. These are met with chiefly in southern Asia; melanism among African leopards 1

1 The name (Late Lat. leopards, Late Gr. λεόραπος) was given by the ancients to an animal supposed to have been a cross between a lion (Lat. leo, Gr. λέων) and a pard (Gr. παράδ, Pers. pard) or panther. Medieval heralds made no distinction in shape between a lion and a leopard, but marked the difference by drawing the leopard showing the full face (see HERALDRY: BEASTS AND BIRDS).
bookworm. Leopardi came forth a Hellene, not merely a consummate Greek scholar, but penetrated with the classical conception of life, and a master of antique form and style. At sixteen he composed a Latin treatise on the Roman rhetoricians of the 2nd century, a commentary on Porphyry's life of Plotinus and a history of astronomy; at seventeen he wrote on the popular errors of the ancients, citing more than four hundred authors. A little later he imposed upon the first scholars of Italy by two odes in the manner of Anacreon. At eighteen he produced a poem of considerable length, the *Appressamento alla Morte*, which, after being lost for many years, was discovered and published by Zanino Volta. It is a vision of the omnipotence of death, modelled upon Petrarch, but more truly inspired by Dante, and in its conception, machinery and general tone offering a remarkable resemblance to Shelley's *Triumph of Life* (1822), of which Leopardi probably never heard. This juvenile work was succeeded (1810) by two lyrical compositions which at once placed the author upon the height which he maintained ever afterwards. The ode to Italy, and that on the monument to Dante erected at Florence, gave voice to the dismay and affliction with which Italy, aroused by the French Revolution, was in torpor of the 17th and 18th centuries, contemplated her forlorn, and degraded condition, her political impotence, her degeneracy in arts and arms and the frivolity or stagnation of her intellectual life. They were the outcry of a student who had found an ideal of national existence in his books, and to whose disappointment everything in his own circumstances lent additional poignancy. But there is nothing unmanly or morbid in the expression of these sentiments, and the odes are surprisingly exempt from the failings characteristic of young poets. They are remarkably chaste in diction, close and nervous in style, sparing in fancy and almost destitute of simile and metaphor, antique in spirit, yet pervaded by modern ideas, combining Landor's dignity with a considerable infusion of the passion of Byron. These qualities continued to characterize Leopardi's poetical writings throughout his life. A third ode, on Cardinal Mai's discoveries of ancient MSS., lamented in the same spirit of indignant sorrow the decadence of Italian literature. The publication of these pieces widened the breach between Leopardi and his father, a delicate but apparently dull and apathetic man, who had lived into the 19th century without imbibing any of its spirit, and who provoked his son's contempt by a superstition unpardonable in a scholar of real learning. Very probably from a mistaken idea of duty to his son, very probably, too, from his own entire dependence in pecuniary matters upon his wife, he for a long time obstinately refused Leopardi funds, recreation, change of scene, everything that could have contributed to combat the growing pessimism which eventually became nothing less than monomanical. The affection of his brothers and sister afforded him some consolation, and he found intellectual sympathy in the eminent scholar and patriot Pietro Giordani, with whom he assiduously corresponded at this period, partly on the ways and means of escaping from "this hermitage, or rather seraglio, where the delights of civil society and the advantages of solitary life are alike wanting." This forms the keynote of numerous letters of his towards the end. His mind is eternally, and to a point, consumed with the contemplation of the past, and his imagination appears in their pathos as those of the banished Ovid. It must be remembered in fairness that the weakness of Leopardi's eyesight frequently deprived him for months together of the resource of study. At length (1822) his father allowed him to repair to Rome, where, though cheered by the encouragement of C. C. J. Bunsen and Niebuhr, he found little satisfaction in the trifling pedantry that passed for philology and archaeology, while his sceptical opinions prevented his taking orders, the indispensable condition of public employment in the Papal States. Dispirited and with exhausted means, he returned to Recanati, where he spent three miserable years, brightened only by the production of several lyrical masterpieces, which appeared in 1824. The most remarkable is perhaps the *Bruto Minore*, the condensation of his philosophy of despair. In 1825 he accepted an engagement to edit Cicero and Petrarch for the publisher Stella at Milan, and took up his residence at Bologna, where his life was for a time made almost cheerful by the friendship of the countess Malvezzi. In 1827 appeared the *Operette Morali*, consisting principally of dialogues and his imaginary biography of Filippo Ottolieri, which have given Leopardi a fame as a prose writer hardly inferior to his celebrity as a poet. Modern literature has few productions so eminently classical in form and spirit, so symmetrical in construction and faultless in style. Lucian is evidently the model; but the wit and irony which were playthings to Lucian are terribly earnest with Leopardi. Leopardi's invention is equal to Lucian's and his only drawback in comparison with his exemplar is that, while the latter's campaign against pretence and imposture commands hearty sympathy, Leopardi's philosophic creed is a repulsive hedonism in the guise of austere stoicism. The chief interlocutors in his dialogues all profess the same unmitigated pessimism, claim emancipation from every illusion that renders life tolerable to the vulgar, and assert or imply a vast moral and intellectual superiority over unenlightened mankind. When, however, we come to inquire what renders them miserable, we find it is nothing but the privation of pleasurable sensation, fame, fortune or other external thing which a lofty code of ethics would deny to be either indefeasibly due to man or essential to his felicity. A page of *Sartor Resartus* scatters Leopardi's sophistry to the winds, and leaves nothing of his dialogues but the consummate literary skill that would render the least fragment precious. As works of art they are a possession for ever, as contributions to moral philosophy they are worthless, and apart from their literary qualities can only escape condemnation if regarded as lyrical expressions of emotion, the wail extorted from a diseased mind by a diseased body. *Filippo Ottolieri* is a portrait of an imaginary philosopher, imitated from the biography of a real sage in Lucian's *Demonax*. Lucian has shown us the philosopher he wished to copy, Leopardi has truly depicted the philosopher he was. Nothing can be more striking or more tragical than the picture of the man superior to his fellows in every quality of head and heart, and yet condemned to sterility and impotence because he has, as he imagines gone a step too far on the road to truth, and illusions exist for him no more. The whole tract is full of remarks on life and character of surpassing depth and justice, manifesting what powers of observation as well as reflection were possessed by the sickly youth who had seen so little of the world.

Want of means soon drove Leopardi back to Recanati, where, deaf, half-blind, sleepless, tortured by incessant pain, at war with himself and every one around him except his sister, he spent the two most unhappy years of his unhappy life. In May 1831 he escaped to Florence, where he formed the acquaintance of a young Swiss philologist, M. de Sinner. To him he confided his unpublished philological writings, with a view to their appearance in Germany. A selection appeared under the title *Excerpta ex scholis criticis J. Leopardi* (Bonn, 1834). The remaining MSS. were purchased after Sinner's death by the Italian government, and, together with Leopardi's correspondence with the Swiss philologist, were partially edited by Aulard. In 1831 appeared a new edition of Leopardi's poems, comprising several new pieces of the highest merit. A translation by A. W. Niebuhr, less austere technically than his earlier compositions, and evince a greater tendency to description, and a keener interest in the works and ways of ordinary mankind. The *Resurrection*, composed on occasion of his unexpected recovery, is a model of concentrated energy of diction, and *The Song of the Wandering Shepherd in Asia* is one of the highest flights of modern lyric poetry. The range of the author's ideas is still restricted, but his style and melody are unsurpassable. Shortly after the publication of these pieces (October 1831) Leopardi was driven from Florence to Rome by an unhappy attachment. His feelings are powerfully expressed in two poems, *To Himself* and *Aspasia*, which seem to breathe wound pride at least as much as wounded love. In 1832 Leopardi returned to Florence, and there formed acquaintance with a young Neapolitan, Antonio Ranieri, himself an author of merit, and destined to escape towards him the part performed by Severn towards Keats, an enviable title to renown.
LEOPARDI—LEOPOLD I.

if Ranieri had not in his old age tarnished it by assuming the relation of Trelawny to the dead Byron. Leopardi accompanied Ranieri and his sister to Naples, and under their care enjoyed four years of comparative tranquility. The acquaintance of the German poet Platen, his sole modern rival in the classical perfection of form, and composed La Ginestra, the most consummate of all his lyrical masterpieces, strongly resembling Shelley’s Mont Blanc, but more perfect in expression. He also wrote at Naples The Sequel to the Battle of the Frogs and Mice, a satire in ottava rima on the abortive Neapolitan revolution of 1820, clever and humorous, but obscure from the local character of the allusions. The more painful details of his Neapolitan residence may be found by those who care to seek for them in the deplorable publication of Ranieri’s peevish old age (Sette anni di sodalizio). The decay of Leopardi’s constitution continued; he became dropsical; and a sudden crisis of his malady, unanticipated by himself alone, put an end to his life-long sufferings on the 15th of June 1837.

The poems which constitute Leopardi’s principal title to immortality are only forty-one in number, and some of these are merely fragmentary. They may for the most part be described as odes, meditative soliloquies, or impassioned addresses, generally couched in a lyrical form, although a few are in magnificent blank verse. Some of them are inspired beyond the bounds of language by imagining the thoughts of the last book of Spenser’s Faerie Queene in the metre of his Epithalamium. They were first edited complete by Ranieri at Florence in 1845, forming, along with the Ode and the Essay, the first volume of El libro dei Lirici, of which does not, however, include The Sequel to the Battle of the Frogs and Mice, first printed at Paris in 1842, nor the afterwards discovered writings. Vols. ii.-iv. contain the philological essays and translations, with their editors’ pseudo-Lyre being kept to v. and vi. the remainder of the correspondence. Later editions are those of G. Chiarini and G. Mestica. The juvenile essays preserved in his father’s library at Recanati were edited by Cugnoni (Opere inedite) in 1879, with the consent of the firm of Stunt Cappelletti (Edizioni della Letteratura Italiana, Perugia 1882). Leopardi’s biography is mainly in his letters (Epistolario, 1st ed., 1849, 5th ed., 1892), to which his later biographers (Brandes, Bouche-Leclercq, Rosa) have merely added criticisms, excellent in their way, more particularly Brandes’s, but generally over-rating Leopardi’s significance in the history of human thought. W. E. Gladstone’s essay (Quart. Rev., 1856), reprinted in vol. ii. of the author’s Gleanings, is too much pervaded by the theological spirit, but is in the main a pattern of generous and discriminating eulogy. They are excellent Genealogies of the poems by Heyse and Brandes. An English translation of the essays and dialogues by C. Edwards appeared in 1888, and most of the dialogues were translated with extraordinary felicity by James Thomson, author of The Two Destinies of a Night, and originally published in the English Review.

LEOPARDO, ALESSANDRO (d. c. 1512), Italian sculptor, was born and died at Venice. His first known work is the imposing mausoleum of the doge Andrea Vendramini, now in the church of San Giovanni e Paolo; in this he had the cooperation of Tullio Lombardo, but the finest parts are Leopardi’s. Some of the figures have been taken away, and two in the Berlin museum are considered to be certainly his work. He was exiled on a charge of fraud in 1497, and recalled in 1490 by the senate to finish Verrocchio’s colossal statue of Bartolommeo Colleoni. He worked between 1503 and 1505 on the tomb of Cardinal Zeno at St Mark’s, which was finished in 1515 by Pietro Lombardo; and in 1505 he designed and cast the bronze sockets for the three flagstaffs of St Mark’s. In the whole of the decorations suggesting some Greek model. (See Venice.)

LEOPOLD (M.H. Ger. Liepoldt; O.H. Ger. Liepold, from liut, Mod. Ger. Leute, “people,” and bold, “bold,” i.e. “bold for the people”), the name which has been that of several European sovereigns.

LEOPOLD I. (1640-1705), Roman emperor, the second son of the emperor Ferdinand III. and his first wife Maria Anna, daughter of Philip III. of Spain, was born on the 9th of June 1640. Intended for the Church, he received a good education, but his prospects were changed by the death of his elder brother, the German king Ferdinand IV., in July 1654, when he became his father’s heir. In 1653 he was chosen king of Hungary and in 1656 king of Bohemia, and in July 1658, more than a year after his father’s death, he was elected emperor at Frankfurt, in spite of the intrigues of Cardinal Mazarin, who wished to place on the imperial throne Ferdinand, elector of Bavaria, or some other prince whose elevation would break the Habsburg succession. Mazarin, however, obtained a promise from the new emperor that he would not send assistance to Spain, then at war with France, and, by joining a confederation of German princes, called the league of the Rhine, France secured a certain influence in the internal affairs of Germany. Leopold’s long reign covers one of the most important periods of European history; for nearly the whole of its forty-seven years he was pitted against Louis XIV. of France, whose dominant personality completely overshadowed Leopold. The emperor was a man of peace and never led his troops in person; yet the greater part of his public life was spent in arranging and directing wars. The first was with Sweden, whose king Charles X. found a useful ally in the prince of Transylvania, George II. Rakoczy, a rebellious vassal of the Hungarian crown. This war, a legacy of the last reign, was waged by Leopold as the ally of Poland until peace was made at Oliva in 1660. A more dangerous foe next entered the lists. The Turks interfered in the affairs of Transylvania, always an unruly district, and this interference brought on a war with the Empire, which after some desultory operations ended in 1663. By a personal appeal to the diet at Regensburg Leopold induced the princes to send assistance for the campaign; troops were also sent by France, and in August 1664 the great imperialist general, Montecucculi, gained a notable victory at St Gotthard. By the peace of Viesca the emperor made a twenty years’ truce with the sultan, granting more generous terms than his recent victory seemed to render necessary.

After a few years of peace began the first of three wars between France and the Empire. The aggressive policy pursued by Louis XIV. towards Holland had aroused the serious attention of Europe, and steps had been taken to check it. Although the French king had sought the alliance of several German princes and encouraged the Turks in their attacks on Austria the emperor at first took no part in this movement. He was on friendly terms with Louis, to whom he was closely related and with whom he had already discussed the partition of the lands of the Spanish monarchy; moreover, in 1671 he arranged with him a treaty of neutrality. In 1672, however, he was forced to take action. He entered into an alliance for the defence of Holland and war broke out; then, after this league had collapsed owing to the defection of the elector of Brandenburg, another and more durable alliance was formed for the same purpose, including, besides the emperor, the king of Spain and several German princes, and the war was renewed. At this time, twenty-five years after the peace of Westphalia, the Empire was virtually a confederation of independent princes, and it was very difficult for its head to conduct any war with vigour and success, some of its members being in alliance with the enemy and others being only lukewarm in their support of the imperial interests. Thus this struggle, which lasted until the end of 1678, was on the whole unfavourable to Germany, and the advantages of the treaty of Nijmegen (February 1679) were with France.

Almost immediately after the conclusion of peace Louis renewed his aggressions on the German frontier. Engaged in an unsuccessful struggle with Turkey, the emperor was again slow to move, and although he joined a league against France in 1682 he was glad to make a truce at Regensburg two years later. In 1686 the league of Augsburg was formed by the emperor and the imperial princes, to preserve the terms of the treaties of Westphalia and of Nijmegen. The whole European position was now bound up with events in England, and the tension lasted until 1688, when William of Orange won the English crown and Louis invaded Germany. In May 1689 the grand alliance was formed, including the emperor, the kings of England, Spain and Denmark, the elector of Brandenburg and others, and a fierce struggle against France was waged throughout almost the whole of western Europe. In general the several campaigns were favourable to the allies, and in September 1697 England and Holland made peace with Louis at Ryswick.
LEOPOLD II.

To this treaty Leopold refused to assent, as he considered that his allies had somewhat neglected his interests, but in the following month he came to terms and a number of places were transferred from France to Germany. The peace with France lasted for about four years and then Europe was involved in the War of the Spanish Succession. The king of Spain, Charles II., was a Habsburg by descent and was related by marriage to the Austrian branch, while a similar tie bound him to the royal house of France. He was feeble and childless, and attempts had been made by the European powers to arrange for a peaceable division of his extensive kingdom. Leopold refused to consent to any partition, and when in November 1700 Charles died, leaving his crown to Philip, duke of Anjou, a grandson of Louis XIV., all hopes of a peaceable settlement vanished. Under the guidance of William III. a powerful league, the grand alliance, was formed against France; of this the emperor was a prominent member, and in 1703 he transferred his claim on the Spanish monarchy to his second son, the archduke Charles. The early course of the war was not favourable to the imperialists, but the tide of defeat had been rolled back by the great victory of Blenheim before Leopold died on the 5th of May 1705.

In governing his own lands Leopold found his chief difficulties in his countersignature of drafts in which his lack of vigor was felt to crush Protestantism. A rising was suppressed in 1671 and for some years Hungary was treated with great severity. In 1681, after another rising, some grievances were removed and a less repressive policy was adopted, but this did not deter the Hungarians from revolting again. Espousing the cause of the rebels the sultan sent an enormous army into Austria early in 1683; this advanced almost unchecked to Vienna, which was besieged from July to September, while Leopold took refuge at Passau. Realizing the gravity of the situation somewhat tardily, some of the German princes, among them the electors of Saxony and Bavaria, led their contingents to the imperial army which was commanded by the emperor's brother-in-law, Charles, duke of Lorraine, but the most redoubtable of Leopold's allies was the king of Poland, John Sobieski, who was already dreaded by the Turks. On the 12th of September 1683 the allied army fell upon the enemy, who was completely routed, and Vienna was saved. The imperialists, among whom Prince Eugene of Savoy became prominent, steadily drove up the victory with others, notably one near Mohar in 1687 and another near Zenta in 1697, and in January 1699 the sultan signed the treaty of Karlowitz by which he admitted the sovereign rights of the house of Habsburg over nearly the whole of Hungary. Before the conclusion of the war, however, Leopold had taken measures to strengthen his hold upon this country. In 1687 at the diet of Pressburg the constitution was changed, the right of the Habsburgs to succeed to the throne without election was admitted and the emperor's elder son Joseph was crowned hereditary king of Hungary.

During this reign some important changes were made in the constitution of the Empire. In 1663 the imperial diet entered upon the last stage of its existence, and became a body permanently in session at Regensburg; in 1692 the duke of Hanover was raised to the rank of an elector, becoming the ninth member of the electoral college; and in 1700 Leopold, greatly in need of help for the impending war with France, granted the title of king of Prussia to the elector of Brandenburg. The net result of these and similar changes was to weaken the authority of the emperor over the members of the Empire, and to compel him to rely more and more upon his position as ruler of the Austrian archduchies and of Hungary and Bohemia, and Leopold was the first who really appears to have realized this altered state of affairs and to have acted in accordance therewith.

The emperor was married three times. His first wife was Margaret Theresa (d. 1673), daughter of Philip IV. of Spain; his second Claudia Felicitas (d. 1676), the heiress of Tirol; and his third Eleanora, a princess of the Palatinate. By his first two wives he had no sons, but his third wife bore him two, Joseph and Charles, both of whom became emperors. He had also four daughters. Leopold was a man of industry and education, and during his later years he showed some political ability. Extremely tenacious of his rights, and regarding himself as an absolute sovereign, he was also very intolerant and was greatly influenced by the Jesuits. In person he was short, but strong and healthy. Although he had no inclination for a military life he loved exercises in the open air, such as hunting and riding; he had also a taste for music.

Leopold's letters to Marco d'Aviano from 1680 to 1699 were edited by O. Klopp and published at Graz in 1888. Other letters are found in the Fontes rerum Austriacarum, Bände 56 and 57 (Venezia, 1880-1904). See also P. Krones, Handbuch der Geschichte Österreichs (Berlin, 1876-1879); R. Baumstark, Kaiser Leopold I. (1875); and A. F. Pribram, Zur Wahl Leopolds I. (Vienna, 1888).

(A. W. H.*)

LEOPOLD II. (1747-1792), Roman emperor, and grand-duke of Tuscany, son of the empress Maria Theresa and her husband, Francis I., was born in Vienna on the 5th of May 1747. He was a third son, and was at first educated for the priesthood, but the theological studies to which he was forced to apply himself are believed to have influenced his mind in a way unfavourable to the Church. On the death of his elder brother Charles in 1765 he inherited the grand duchy of Tuscany, which was erected into a "secondogeniture" or apanage for a second son. This settlement was the condition of his marriage on the 5th of August 1764 with Maria Luisa, daughter of Charles III. of Spain, and on the death of his father Francis I. (13th August 1765) he succeeded to the grand duchy. For five years he exercised little more than nominal authority under the supervision of counsellors appointed by his mother. In 1770 he made a journey to Vienna to secure the removal of this vexatious guardianship, and returned to Florence with a free hand. During the twenty years which elapsed between his return to Florence and the death of his eldest brother Joseph II. in 1790 he was employed in reforming the administration of his small state. The reformation was carried out by the removal of the ruinous restrictions on industry and personal freedom imposed by his predecessors of the house of Medici, and left untouched during his father's life; by the introduction of a rational system of taxation; and by the execution of profitable public works, such as the drainage of the Val di Chiana. As a reward of his valiant efforts, and of the small naval force kept up by the Medici, the whole of his revenue was left free for the improvement of his state. Leopold was never popular with his Italian subjects. His disposition was cold and retiring. His habits were simple to the verge of sordidness, though he could display splendour on occasion, and he could not help offending those of his subjects who had profited by the abuses of the Medicean régime. But his steady, consistent and intelligent administration, which advanced step by step, making the second only when the first had been justified by results, brought the grand duchy to a high level of material prosperity. His ecclesiastical policy, which disturbed the deeply rooted convictions of his people, and brought him into collision with the pope, was not successful. He was unable to secularize the property of the religious houses, or to put the clergy entirely under the control of the lay power.

During the last few years of his rule in Tuscany Leopold had begun to be frightened by the increasing disorders in the German and Hungarian dominions of his family, which were the direct result of his brother's headlong methods. He and Joseph II. were tenderly attached to one another, and met frequently both before and after the death of their mother, while the portrait by Pompeo Baltoni in which they appear together shows that they bore a strong personal resemblance to one another. But it may be said of Leopold, as of Fontenelle, that his heart was made of brains. He knew that he must succeed his childless eldest brother in Austria, and he was unwilling to inherit his unpopular nature. Therefore, when in 1789 Joseph, who knew himself to be dying, asked him to come to Vienna, and become co-regent, Leopold coldly evaded the request. He was still in Florence when Joseph II. died at Vienna on the 20th of February 1790, and he did not leave his Italian capital till the
LEOPOLD I.

3rd of March. Leopold, during his government in Tuscany, had shown a speculative tendency to grant his subjects a constitutional situation. When he succeeded to the Austrian lands he began by making large concessions to the interests offended by his brother's innovations. He recognized the Estates of his different dominions as "the pillars of the monarchy," pacified the Hungarians and divided the Belgian insurgents by concessions. When these failed to restore order, he marched troops into the country, and re-established at the same time his own authority, and the historic franchises of the Flemings. Yet he did not surrender any part that could be retained of what Maria Theresa and Joseph had done to strengthen the hands of the state. He continued, for instance, to insist that no papal bull could be published in his dominions without his consent (placetum regium).

If Leopold's reign as emperor, and king of Hungary and Bohemia, had been prolonged during years of peace, it is probable that he would have repeated his successes as a reforming ruler in Tuscany on a far larger scale. But he lived for barely two years, and during that period he was hard pressed by peril from west and east alike. The growing revolutionary disorders in France endangered the life of his throne. He was called upon to advise Leopold XVI., and also threatened his own dominions with the spread of a subversive agitation. His sister sent him passionate appeals for help, and he was pestered by the royalist emigrants, who were intriguing both to bring about an armed intervention in France, and against Louis XVI. From the east he was threatened by the aggressive ambition of Catherine II. of Russia, and by the unconspicuous policy of Prussia. Catherine would have been delighted to see Austria and Prussia embark on a crusade in the cause of kings against the Revolution. While they were busy beyond the Rhine, she would have annexed what remained of Poland, and would have made conquests in Turkey. Leopold II. had no difficulty in seeing through the rather transparent cunning of the Russian empress, and he refused to be misled. To his sister he gave good advice and promises of help if she and her husband could escape from Paris. The emigrants who followed him pertinaciously were refused audience, or when they forced themselves on him were peremptorily denied all help. Leopold was too purely a politician not to be seriously pleased at the destruction of the power of France and of the influence in Europe by her internal disorders. Within six weeks of his accession he displayed his contempt for her weakness by practically tearing up the treaty of alliance made by Maria Theresa in 1756 and opening negotiations with England to impose a check on Russia and Prussia. He was able to put pressure on England by threatening to cede his part of the Low Countries to France, and then, when secure of English support, he was in a position to baffle the intrigues of Prussia. A personal appeal to Frederick William II. led to a conference between them at Reichenbach in July 1790, and to an arrangement which was in fact a defeat for Prussia. Leopold's coronation as king of Hungary on the 15th of November 1790, was preceded by a settlement with the diet in which he recognized the dominant position of the Magyars. He had already made an eight months' truce with the Turks in September, which prepared the way for the termination of the war begun by Joseph II. the peace of Sistova being signed in August 1791. The pacification of his eastern dominions left Leopold free to re-establish order in Belgium and to confirm friendly relations with England and Holland.

During 1791 the emperor continued to be increasingly occupied with the affairs of France. In January he had to dismiss the count of Artois, afterwards Charles X., king of France, in a very peremptory way. His good sense was revolted by the folly of the French emigrants, and he did him utmost to avoid being entangled in the affairs of that country. The insults inflicted on Louis XVI. and Marie Antoinette, however, at the time of their attempted flight to Varennes in June, stirred his indignation, and he made a general appeal to the sovereigns of Europe to take common measures in view of events which "immediately compromised the honour of all sovereigns, and the security of all governments." Yet he was most directly interested in the conference at Sistova, which in June led to a final peace with Turkey. On the 25th of August he met the king of Prussia at Pillnitz, near Dresden, and they drew up a declaration of their readiness to intervene in France if and when their assistance was called for by the other powers. The declaration was a mere formality, for, as Leopold knew, neither Russia nor England was prepared to act, and he endeavoured to guard against the use which he foresaw the emigrants would endeavour to make of it. In face of the agitation caused by the Pillnitz declaration in France, the intrigues of the emigrants, and the attacks made by the French revolutionists on the rights of the German princes in Alsace, Leopold continued to hope that intervention might not be required. When Louis XVI. swore to observe the constitution of September 1791, the emperor professed to think that a settlement had been reached in France. The attacks on the rights of the German princes on the left bank of the Rhine, and the increasing violence of the parties in Paris which were agitating to bring about war, soon showed, however, that this hope was vain. Leopold met the threatening language of the revolutionists with dignity and temper. His sudden death on the 1st of March 1792 was an irreparable loss to the world.
of the 24 Articles (see Belgium). From this date until his
death, King Leopold spent all his energies in the wise administra-
tion of the affairs of the newly formed kingdom, which may be
said to owe in a large measure its first consolidation and constant
prosperity to the care and skill of his discreet and fatherly
government. In 1848 the throne of Belgium stood unshaken
amidst the revolutions which marked that year in almost every
European country. On the 8th of August 1832 Leopold married,
as his second wife, Louise of Orleans, daughter of Louis Philippe,
knight of the French. Queen Louise endeared herself to the
Belgian people, and her death in 1850 was felt as a national loss.
This union produced two sons and one daughter—(1) Leopold, 
afterwards king of the Belgians; (2) Philip, count of Flanders;
(3) Marie Charlotte, who married Maximilian of Austria, the
unfortunate emperor of Mexico. Leopold I. died at Laeken
on the 10th of December 1865. He was a most cultured man and
a great reader, and did his utmost during his reign to encourage
art, science and education. His judgment was universally
respected by contemporary sovereigns and statesmen, and he
was frequently spoken of as "the Nestor of Europe" (see also
Victoria, Queen).

See Th. Juste, Leopold Ier, roi des Belges d'après des docs. inéd. 1789-1865 (2 vols., Brussels, 1868), and Les Fondateurs de la monarchie Belge (22 vols., Brussels, 1876-1880); J. J. Thonissen, La Belgique sous le règne de Leopold Ier (Louvain, 1862).

LEOPOLD II. [LEOPOLD LOUIS PHILIPPE MARIE VICTOR] (1835-1909), king of the Belgians, son of the preceding, was born
at Brussels on the 6th of April 1835. In 1846 he was created
duke of Brabant and appointed a sub-lieutenant in the army,
in which he served until his accession, by which time he had
reached the rank of lieutenant-general. On attaining his
majority he was made a member of the senate, in whose proceed-
gings he took a lively interest, especially in matters concerning
the development of Belgium and its trade. On the 22nd of
August 1853 Leopold married Marie Henriette (1836-1902),
dughter of the archduke Joseph of Austria, palatine of Hungary,
by his wife Marie Dorothea, duchess of Württemberg. This
princess, who was a great-granddaughter of the empress Maria
Theresa, and a great-niece of Marie Antoinette, endeared herself
to the people by her elevated character and indefatigable
benevolence, while her beauty gained for her the sobriquet of
"The Rose of Brabant"; she was also an accomplished artist
and musician, and a fine horsewoman. Between the years
1834 and 1865 Leopold travelled much abroad, visiting India
and China as well as Egypt and the countries on the Mediter-
nanean coast of Africa. On the 10th of December 1865 he
succeeded his father. On the 28th of January 1866 he lost his
only son, Leopold (b. 1859), duke of Hainault. The king's
brother Philip, count of Flanders (1837-1905), then became
heir to the throne; and on his death his son Albert (b. 1873)
became heir-presumptive. During the Franco-Prussian War
(1870-1871) the king of the Belgians preserved neutrality in
a period of unusual difficulty and danger. But the most notable
event in Leopold's career was the foundation of the Congo Free
State (q.v.). While still duke of Brabant he had been the first
to call the attention of the Belgians to the need of enlarging
their horizons beyond the Rhine, and after his accession to the throne
he gave the first impulse towards the development of this idea
by founding in 1856 the Association Internationale Africaine.
He enlisted the services of H. M. Stanley, who visited Brussels
in 1878 after exploring the Congo river, and returned in 1879
to the Congo as agent of the Comité d'Études du Haut Congo,
soon afterwards reorganized as the "International Association
of the Congo." This association was, in 1884-1885, recognized
by the powers as a sovereign state under the name of the État
Indépendant du Congo. Leopold's exploitation of this vast
territory, which he administered autocratically, and in which
he associated himself personally with various financial schemes,
was understood to bring him an enormous fortune; it was
the subject of acutely hostile criticism, to a large extent sub-
stituted by the report of a commission of inquiry instituted
by the king himself in 1904, and followed in 1908 by the annexa-
tion of the state to Belgium (see Congo Free State: History).
In 1880 Leopold sought an interview with General G. C. Gordon
and obtained his promise, subject to the approval of the British
government, to enter the Belgian service on the Congo. Three
years later Leopold claimed fulfilment of the promise, and
Gordon was about to proceed to the Congo when the British
government required his services for the Sudan. On the 15th
of November 1902 King Leopold's life was attempted in Brussels
by an Italian anarchist named Rubinio. Queen Marie Henriette
died at Spa on the 15th of September of the same year. Besides
the son already mentioned she had borne to Leopold three
daughters—Louise Marie Amélie (b. 1858), who in 1875 married
Philip of Saxe-Coburg and Gotha, and was divorced in 1906;
Stéphanie (b. 1864), who married Rudolph, crown prince of
Austria, in 1881, and after his death in 1889 married, against
her father's wishes, Elemer, Count Lonyay, in 1900; and
Clémentine (b. 1872). At the time of the queen's death an
unseemly incident was occasioned by Leopold's refusal to see
his daughter Stéphanie, who in consequence was not present at
her mother's funeral. The disagreeable impression on the public
may have been deepened by an unfortunate litigation,
lasting for two years (1904-1906), over the deceased queen's
will, in which the creditors of the princess Louise, together
with princess Stéphanie (Cnrntess Lonyay), claimed that under
the Belgian law the queen's estate was entitled to half of her
husband's property. This claim was disallowed by the Belgian
courts. The king died at Laeken, near Brussels, on the 17th
of December 1909. On the 23rd of that month his nephew
took the oath to observe the constitution, assuming the title of
Albert I. King Leopold was personally a man of considerable
attainments and much strength of character, but he was a
notoriously dissolute monarch, who even to the last offended
decent opinion by his indulgences at Paris and on the Riviera.
The wealth he amassed from the Congo he spent, no doubt,
royally not only in this way but also on public improvements
in Belgium; but he had a hard heart towards the natives of
his distant possession.

LEOPOLD II. (1797-1879), of Habsburg-Lorraine, grand-duke
of Tuscany, was born on the 3rd of October 1797, the son of
the grand-duke Ferdinand III., whom he succeeded in 1824.
During the first twenty years of his reign he devoted himself to
the internal development of the state. His was the mildest and least
reactory of all the Italian despots of the day, and although
always subject to Austrian influence he refused to adopt the
Austrian methods of government, allowed a fair measure of
liberty to the press, and permitted many political exiles from
other states to dwell in Tuscany undisturbed. But when in the
early 'forties a feeling of unrest spread throughout Italy, even
in Tuscany demands for a constitution and other political reforms
were advanced; in 1845-1846 riots broke out in various parts of
the country, and Leopold granted a number of administrative
reforms. But Austrian influence prevented him from going
further, even had he wished to do so. The election of Pope Pius
IX. gave fresh impetus to the Liberal movement, and on the
4th of September 1847 Leopold instituted the National Guard—
a first step towards the constitution; shortly after the marchese
Cosimo Ridelit was appointed prime minister. The granting
of the Neapolitan and Piedmontese constitutions was followed
(17th February 1848) by that of Tuscany, drawn up by Gino
Capponi. The revolution in Milan and Vienna aroused a fever
of patriotic enthusiasm in Tuscany, where war against Austria
was demanded; Leopold, giving way to popular pressure, sent
a force of regulars and volunteers to co-operate with Piedmont
in the Lombard campaign. His speech on their departure was
uncompromisingly Italian and Liberal. "Soldiers," he said,
"the holy cause of Italian freedom is being decided to-day on
the fields of Lombardy. Already the citizens of Milan have
purchased their liberty with their blood and with a heroism of
which history offers few examples. . . . Honour to the arms of Italy! Long
live Italian independence!" The Tuscan contingent fought
bravely, if unsuccessfully, at Curtatone and Montanara. On the
26th of June the first Tuscan parliament assembled, but the
disturbances consequent on the failure of the campaign in Lombardy led to the resignation of the Ridoli ministry, which was succeeded by that of Gino Capponi. The riots continued, especially at Leghorn, which was a prey to actual civil war, and the democratic party of which F. D. Guerrazzi and G. Montanelli were leading lights became every day more influential. Capponi resigned, and Leopold reluctantly agreed to a Montanelli-Guerrazzi ministry, which in its turn had to fight against the extreme republican party. New elections in the autumn of 1848 returned a constitutional majority, but it ended by voting in favour of a constituent assembly. There was talk of instituting a central Italian kingdom with Leopold as king, to form part of a larger Italian federation, but in the meanwhile the grand duke, alarmed at the revolutionary and republican agitations in Tuscany and encouraged by the success of the Austrian arms, was, according to Montanelli, negotiating with Field-Marshal Radetzky and with Pius IX., who had now abandoned his Liberal tendencies, and fled to Gaeta. Leopold had left Florence for Siena, and eventually for Porto S. Stefano, leaving a letter to Guerrazzi in which, on account of a protest from the pope, he declared that he could not agree to the proposed constituent assembly. The utmost confusion prevailed in Florence and other parts of Tuscany. On the 9th of February 1849 the republic was proclaimed, largely as a result of Mazzini’s exhortations, and on the 14th Leopold sailed for Leghorn. A tid was appointed. But there was great discontent, and the defeat of Charles Albert at Novara caused consternation among the Liberals. The majority, while fearing an Austrian invasion, desired the return of the grand-duke who had never been unpopular, and in April 1849 the municipal council usurped the powers of the assembly and invited him to return, “to save us by means of the restoration of the constitutional monarchy surrounded by popular institutions, from the shame and ruin of a foreign invasion.” Leopold accepted, although he said nothing about the foreign invasion, and on the 1st of May sent Count Luigi Serristori to Tuscany with full powers. But at the same time the Austrians occupied Lucca and Leghorn, and although Leopold simulated surprise at their action it has since been proved, as the Austrian general d’Aspre declared at the time, that Austrian intervention was due to the request of the grand-duke. On the 24th of May the latter appointed G. Baldasseroni prime minister, on the 25th the Austrians entered Florence and on the 28th of July Leopold himself returned. In April 1850 he concluded a treaty with Austria sanctioning the continuation for an indefinite period of the Austrian occupation of Leghorn, in exchange for which he dismissed all his disloyal officers, and the following year established a concordat with the Church of a very clerical character. He feebly asked Austria if he might maintain the constitution, and the Austrian premier, Prince Schwarzenberg, advised him to consult the pope, the king of Naples and the dukes of Parma and Modena. On their advice he formally revoked the constitution (1852). Political trials were held, Guerrazzi and many others being condemned to long terms of imprisonment, and although in 1855 the Austrian troops left Tuscany, Leopold’s popularity was gone. A part of the Liberals, however, still believed in the possibility of a constitutional grand-duke who could be induced for a second time to join Piedmont in a war against Austria, whereas the popular party headed by F. Bartolommei and G. Doli realized that only by the expulsion of Leopold could the national aspirations be realized. When in 1859 France and Piedmont made war on Austria, Leopold’s government failed to prevent numbers of young Tuscan volunteers from joining the Franco-Piedmontese forces. Finally an agreement was arrived at between the aristocratic constitutionalists and the popular party, as a result of which the grand-duke’s participation in the war was electorally sanctioned. On the 1st of June Leopold once more appeared at Leghorn, but it was more by the grace of the popes and the Austrians than the admiring crowds, and entrusted Don Nerli Corsini with the formation of a ministry. The popular demands presented by Corsini were for the abdication of Leopold in favour of his son, an alliance with Piedmont and the reorganization of Tuscany in accordance with the eventual and definite reorganization of Italy. Leopold hesitated and finally rejected the proposals as derogatory to his dignity.

On the 27th of April there was great excitement in Florence, Italy. Leopold appeared everywhere, but order was maintained, and the grand-duke and his family departed for Bologna undisturbed. Thus the revolution was accomplished without a drop of blood being shed, and after a period of provisional government Tuscany was incorporated in the kingdom of Italy. On the 21st of July Leopold abdicated in favour of his son Ferdinand IV., who never reigned, but issued a protest from Dresden (26th March 1860). He spent his last years in Austria, and died in Rome on the 29th of January 1870.

Leopold of Tuscany was a well-meaning, not unkindly man, and fonder of his subjects than were the Italian despots, but he was weak, and too closely bound by family ties and Habsburg traditions ever to become a real Liberal. Had he not joined the concourse of autocrats at Gaeta, and, above all, had he not summoned Austrian assistance while denying that he had done so, in 1849, he might yet have preserved his throne, and even changed the whole course of Italian history. At the same time his rule, if not harsh, was enervating and demoralizing.

See G. Baldasseroni, Leopold II (Florence, 1871), useful but reactionary in tendency; the author having been Leopold’s minister;*> . Montanelli, Memorie del principe di Isola Terra (Turin, 1853); F. D. Guerrazzi, Memorie (Leghorn, 1848); Zobi, Storia civile della Toscana, vols. iv.-v. (Florence, 1850-1852); A. von Reumont, Geschicchte Toscanen (2 vols., Gothra, 1876-1877); M. (Turin, 1895). See also Ricassoli; Bartolommei; Capponi, Gino; &c.

LEOPOLD II., a lake of Central Africa in the basin of the Kasaï, cut by 2° S. and 18° 10’ E. It has a length N. to S. of about 75 m., is 30 m. across at its northern end, and 10 m. across at its southern end. Numerous bays and gulfs render its outline highly irregular. Its shores are flat and marshy, the lake being (in all probability) simply the lowest part of a vast lake which existed here before the Kasaï system breached the barrier—at Kwa mouth—separating it from the Congo. The lake is fed by the Lokoro (about 300 m. long) and smaller streams from the east. Its northern and western affluents are comparatively unimportant. It discharges its waters (at its southern end) into the Mfini, which is in reality the lower course of the Lukenyi. The lake is gradually diminishing in area; in the rainy season it overflows its banks. The surrounding country is very flat and densely wooded.

See Kasaï, and articles and maps in Le Mouvement géog., spec. soc., No. 29 (1910) vol, xxiv., No. 38 (1907).

LEOTYCHIDES, Spartan king, of the Euryptodid family, was descended from Theopompos through his younger son Anaxandridas (Herod, viii. 131), and in 491 B.C. succeeded Demaratus (g.v.), whose title to the throne he had with Cleomenes’ aid successfully challenged. He took part in Cleomenes’ second expedition to Aegina, on which ten hostages were seized and handed over to the Athenians for safe custody: for this he narrowly escaped being surrendered to the Aeginetans after Cleomenes’ death. In the spring of 479 he found him in command of the Greek fleet of 110 ships, first at Aegina and afterwards at Delos. In August he attacked the Persian position at Mycale on the coast of Asia Minor opposite Saimos, inflicted a crushing defeat on the land-army, and annihilated the fleet which was drawn up on the shore. Soon afterwards he sailed homeward with the Peloponnesians, leaving the Athenians to prosecute the siege of Sestos. In 476 he led an army to Thessaly to punish the Aleuadae of Larisa for the aid they had rendered to the Persians and to strengthen Spartan influence in northern Greece. After a series of victories he accepted a bribe from the enemy to withdraw. For this he was brought to trial at Sparta, and to save his life he fled to the temple of Athena, Aleaion. Sentence of exile was passed, his house was razed and his grandson Archidamus II. ascended the throne (Herod. vi. 65-87. ix. 90-114; Thucydid s. i. 89; Pausanias iii. 4. 3. 7. 9-10; Plutarch, De malignitate Herodoti, 21, p. 859 d; Diodorus xi. 34-37).
According to Diodorus (xi. 48) Leotychides reigned twenty-two years, his successor Archidamus forty-two years. The total duration of the two reigns, sixty-four years, we know to be correct, for Leotychides came to the throne in 491 and Archidamus (q.v.) died in 472. On this basis, then, Leotychides would fall in 458-459. These years are given as the period of the preceding year (e.g. Meyer, Geschicht der Altertumer, iii. § 287). But Diodorus is not consistent with himself; he attributes (xi. 48) Leotychides’s death to the year 476-475 and he records (xii. 35) Archidamus’s death in 479. But the following years at the head of the Peloponnesian army (xii. 42, 47, 52). Further, he says expressly that Leotychides and Archidamus, kaisaroi kai duxoi, i.e. that he lived twenty-two years after his accession, may succeed to the time which elapsed between his exile and his death. In that case Leotychides died in 469, and 476-475 may be the year in which his reign, though not his life, ended. This date seems to be from what we know of the political situation in general, to be more probable than the later one for the Thessalian campaign.

G. Busolt, Griech. Geschichte, iii. 83, note; J. B. Burry, History of Greece, p. 326; G. Grote, History of Greece, new edition 1888, iv. 349, note; also abridged edition 1897, p. 273, note 3. Beloch’s view (Griech. Geschichte, i. 455, note 2) that the expedition took place in 476, the trial and fight in 469, is not generally accepted. (M. N. T.)

LEOVIGILD, or LÖVENSELD (d. 586), king of the Visigoths, was king in 568 after the short period of anarchy which followed the death of King Athanagild, whose widow, Ingundis, he married. At first he ruled that part of the Visigothic kingdom which lay to the south of the Pyrenees, his brother Liuva or Leova governing the small part to the north of these mountains; but in 572 Liuva died and Leovigild became sole king. At this time the Visigoths who settled in Spain early in the 5th century were menaced by two powerful enemies, the Suevi who had a small kingdom in the north-west of the peninsula, and the Byzantines who had answered Athanagild’s appeal for help by taking possession of the province of Narbonne in the south-west. Their kingdom, too, was divided and weakened by the fierce hostility between the orthodox Christians and those who professed Arianism. Internal and external dangers alike, however, failed to daunt Leovigild, who may fairly be called the restorer of the Visigothic kingdom. He turned first against the Byzantines, who were defeated several times; he took Cordova and chastised the Suevi; and then by stern measures he destroyed the power of those unruyl and rebellious chieftains who had reduced former kings to the position of ciphers. The chronicler tells how, having given peace to his people, he, first of the Visigothic sovereigns, assumed the title of a king and made Toledo his capital. He strengthened the position of his family and provided for the security of his kingdom by associating his two sons, Recared and Hermengild, with himself in the kingly office and placing parts of the land under their rule. Leovigild himself was an Arian, being the last of the Visigothic kings of his line that could claim to be a bishop of orthodox Christians; although he was obliged to punish them when they conspired against him with his external enemies. His son Hermengild, however, was converted to the orthodox faith through the influence of his Frankish wife, Ingundis, daughter of King Sigebert I., and of Leander, metropolitan of Seville. Allying himself with the Byzantines and other enemies of the Visigoths, and supported by most of the orthodox Christians he headed a formidable insurrection. The struggle was fierce; but at length, employing persuasion as well as force, the old king triumphed. Hermengild was captured; he refused to give up his faith and in March or April 585 he was executed. He was canonized at the request of Philip II., king of Spain, by Pope Sixtus V. About this time Leovigild put an end to the kingdom of the Suevi. During his last years he was engaged in a war with the Franks. He died at Toledo on the 21st of April 586 and was buried in the church of San Recto.

LEPAPE, BATTLE OF, fought on the 7th of October 1571. The conquest of Cyprus by the Turks, and their aggressions on the Christian powers, frightened the states of the Mediterranean into forming a holy league for their common defence. The main promoter of the league was Pope Pius V., but the bulk of the forces was supplied by the republic of Venice and Philip II. of Spain, who was peculiarly interested in checking the Turks both because of the Moorish element in the population of Spain, and because he was also sovereign of Naples and Sicily. In compliment to King Philip, the general command of the league’s fleet was given to his natural brother, Don John of Austria. It included, however, only twenty-four Spanish ships. The great majority of the two hundred galleys and eight galleasses, of which the fleet was composed, came from Venice, under the command of the provveditore Barbarigo; from Genoa, which was in close alliance with Spain, under Gianandrea Doria; and from the Pope whose squadron was commanded by Marc Antonio Colonna. The Sicilian and Neapolitan contingents were commanded by the marquis of Santa Cruz, and Cardona, Spanish officers. Eight thousand Spanish soldiers were embarked. The allied fleet was collected slowly at Messina, from whence it advanced by the passage between Ithaca and Cephalonia to Cape Matara near Dragonera. The Turkish fleet which had come up from Cyprus and Crete anchored in the Gulf of Patras. It consisted in all a galleys with nine galleasses of both the Christians’, and less well supplied with cannon or small arms. The Turks still relied mainly on the bow and arrow. Ali, the capitan pasha, was commander-in-chief, and he had with him Chilulok Bey of Alexandria, commonly called Scirocco, and Uluch Ali, dey of Algiers. On the 7th of October the Christian fleet advanced to the neighbourhood of Cape Scrofa. It was formed in the traditional order of the galleys—a long line abreast, subdivided into the centre or “battle” commanded by Don John in person, the left wing under the provveditore Barbarigo, and the right under Gianandrea Doria. A reserve squadron was placed behind the centre under the marquess of Santa Cruz, and the eight lumbering galleasses were stationed at intervals in front of the line to break the formation of the Turks. The capitan pasha left his anchor in the Gulf of Patras with his fleet in a single line, without reserve or advance-guard. He was himself in the centre, with Scirocco at his right and Uluch Ali at his left. The two fleet’s last line of Cape Scrofa, both drawn up from north to south, the land being close to the left flank of the Christians, and the right of the Turks. To the left of the Turks and the right of the Christians, there was open sea. Ali Pasha’s greater numbers enabled him to outflank his enemy. The Turks charged through the intervals between the galleasses, which proved to be of no value. On their right Scirocco outflanked the Venetians of Barbarigo, but the better build of the galleys of Saint Mark and the admirable discipline of their crews gave them the victory. The Turks were almost all sunk or driven on shore. Scirocco and Barbarigo both lost their lives. On the centre Don John and the capitan pasha met prow to prow—the Christians reserving the fire of their bow guns (called di curcio) till the moment of impact, and then boarding. Ali Pasha was slain and his galleys taken. Everywhere on the centre the Christians gained the upper hand, but their victory was almost turned into a defeat by the mishandling of Uluch Ali. In fear lest he should be outflanked by Uluch Ali, he stood out to sea, leaving a gap between himself and the centre. The day of Algiers, who saw the opening, reversed the order of his squadron, and fell on the right of the centre. The galleys of the Order of Malta, which were stationed at this point, suffered severely, and their flagship was taken with great slaughter. A disaster was averted by the marquess of Santa Cruz, who brought up the reserve. Uluch Ali then retreated with sail and oar, bringing most of his division off in good order.

The loss of life in the battle was enormous, being put at 20,000 for the Turks and 8000 for the Christians. The battle of Lepanto was of immense political importance. It gave the naval power of the Turks a blow from which it never recovered, and put a stop to their aggression in the Eastern Mediterranean. Historically the battle is interesting because it was the last example of an encounter on a great scale between fleets of galleys and also because it was the last crusade. The Christian powers of the Mediterranean did really combine to avert the ruin of Christendom. Hardly a noble house of Spain or Italy was not represented in the fleet, and the princes headed the boarders. Volunteers came from all parts of Europe, and it is said that...
LE PATURE—LEPIDOPTERA

among them was Sir Richard Grenville, afterwards famous for his fight in the “Revenge” off Flores in the Azores. Cervantes was undoubtedly present, and had his left hand shattered by a Turkish bullet.

For full accounts of the battle, with copious references to authorities and to ancient controversies, mostly arising out of the conduct of Doria, see Sir W. Stirling Maxwell, Don John of Austria (1863); and in Lepeha, La Guerre de Chypre et la conquête de Lépanto (1888).

LE PATURE, JEAN (1618-1682), French designer and engraver. He was apprenticed to a carpenter and builder and in addition to learning mechanical and constructive work developed considerable facility with the pencil. His designs, which were innumerable in quantity and exuberant in fancy, consisted mainly of ceilings, friezes, chimney-pieces, doorways and mural decorations; he also devised fire-dogs, sideboards, cabinets, console tables, mirrors and other pieces of furniture; he was long employed at the Gobelins. His work is often excessively flamboyant and over-embellished; he revelled in amorini and swags, arabesques and cartouches. His chimney-pieces, however, were frequently simple and elegant. His engraved plates, almost entirely original, are something like 1500 in number and include a portrait of himself. He became a member of the academy of Paris in 1677.

LEPCHA, the name of the aboriginal inhabitants of Sikkim (q.v.). A peace-loving people, the Lepchas have been repeatedly conquered by surrounding hill-tribes, and their ancient patriarchal customs are dying out. The total number of speakers of Lepeha, or Rong, in all India in 1901, was only 10,291. Their rich and beautiful language has been preserved from extinction by the efforts of General Mainwaring and others; but their literature was almost entirely destroyed by the Tibetans, and their traditions are being rapidly forgotten. Once free and independent, they are now the poorest people in Sikkim, and it is from them that the coolie class is drawn. They are above all things woodmen, knowing the ways of beasts and birds, and possessing an extensive zoological and botanical nomenclature of their own.

See Florence Donaldson, Lepcha Land (1900).

LE PELETIER (or LEPETIER), DE SAINT-FARCEAU, LOUIS MICHEL (1760-1793), French politician, was born on the 29th of May 1760 at Paris. He belonged to a well-known family, his great-grandfather, Michel Robert Le Peletier des Forts, count of Saint-Farceau, having been controller-general of finance. He inherited a great fortune, and soon became president of the parlement of Paris and in 1789 he was a deputy of the noblesse to the States-General. At this time he shared the conservative views of the majority of his class; but by slow degrees his ideas changed and became very advanced. On the 13th of July 1789 he demanded the recall of Necker, whose dismissal by the king had aroused great excitement in Paris; and in the Constituent Assembly he had moved the abolition of the penalty of death, of the galleys and of branding, and the substitution of beheading for hanging. This attitude won him great popularity, and on the 21st of June 1790 he was made president of the Constituent Assembly. During the existence of the Legislative Assembly, he was president of the general council for the department of the Yonne, and was afterwards elected by this department as a deputy to the Convention. Here he was in favour of the trial of Louis XVI. by the assembly and voted for the death of the king. This vote, together with his ideas in general, won him the hatred of the royalists, and on the 20th of January 1793, the eve of the execution of the king, he was assassinated in the Palais Royal at Paris by a member of the king’s body-guard. The Convention honoured Le Peletier by a magnificent funeral, and the painter J. L. David represented his death in a famous picture, which was later destroyed by his daughter. Towards the end of his life, Le Peletier had interested himself in the question of public education; he left fragments of a plan, the ideas contained in which were borrowed in later schemes. His assassin fled to Normandy, where, on the point of being discovered, he blew out his brains. Le Peletier had a brother, Félix (1769-1837), well known for his advanced ideas. His daughter, Suzanne Louise, was “adopted” by the French nation.

See Œuvres de M. le Peletier de Saint-Fargeau (Brussels, 1826) with a life by his brother Félix; E. Le Blant, “Le Peletier de St-Fargeau, et son meurtrier,” in the Correspondant (1874); F. Clerembry, Épisodes de la Révolution (Rouen, 1891); Brette, “La Réforme de la législation universelle,” et le plan de Lepeletier Saint-Fargeau, in La Révolution française, sér. (1902); and M. Tourneux, Bibliotheq. de l’hist. de Paris... (vol. i., 1890, Nos. 3896-3970, and vol. iv., 1906, sér. Lepeletier).

LEPIDOLITE, or Lithia-Mica, a mineral of the mica group (see Mica). It is a basic aluminium, potassium and lithium fluo-silicate, with the approximate formula KLi[Al(OH,F)]Al(SiO₃). Lithia and fluorine are each present to the extent of about 5%; rubidium and caesium are sometimes present in small amounts. Distinctly developed monoclinal crystals or cleavage sheets of large size are of rare occurrence, the mineral being usually found as scaly aggregates, and on this account was named lepidolite (from Gr. lepie, scale) by M. H. Klaproth in 1792. It is usually of a lilac or peach-blossom colour, but is sometimes greyish-white, and has a pearly lustre on the cleavage surfaces. The hardness is 2½-3½, and the sp. gr. 2.8-2.9, the optic axial angle measures 50°-70°. It is found in pegmatite-veins, often in association with pink tourmaline (rubellite) and sometimes intergrown in parallel position with muscovite. Scaly masses of considerable extent are found at Rozena near Bystřice in Moravia and at Pala in San Diego county, California. The material from Rozena has been known since 1791, and has sometimes been cut and polished for ornamental purposes: it has a pretty colour and spangled appearance and takes a good polish, but is rather soft. At Pala it has been extensively mined for the preparation of lithium and rubidium salts. Other localities for the mineral are the island of Usö in Sweden, and Auburn and Paris in Maine, U.S.A.; at Alabaska near Mursinka in the Urals large isolated crystals have been found, and from Central Australia transparent cleavage sheets of a fine lilac colour are known.

The lithium-mica zinnwaldite or lithioclase is closely allied to lepidolite, differing from it in containing some ferrous iron in addition to the constituents mentioned above. It occurs as greyish silvery scales with hexagonal outlines in the tin-bearing granites of Zinnwald in the Erzgebirge, Bohemia and of Cornwall.

(L. J. S.)

LEPIDOPTERA (Gr. l³pido, a scale or husk, and πτερον, a wing), a term used in zoological classification for one of the largest and best-known orders of the class Hexapoda (q.v.), in order that comprises the insects popularly called butterflies and moths. The term was first used by Linnaeus (1735) in the sense still accepted by modern zoologists, and there are few

After Edwards, Riley and Howard's Insect Life, vol. 3 (U.S. Dept. Agr.).

**Fig. 1.** a. Cryophasea unipunctata, Donov., Australia. a, Larva; c, pupa, natural size; b, 2nd and 3rd abdominal segments of larva; d, cremaster of pupa, magnified. The groups of animals as to whose limits and distinguishing characters less controversy has arisen

**Characters.**—The name of the order indicates the fact that the wings (and other parts of the body) are clothed with flattened
cuticular structures—the scales (fig. 7)—that may be regarded as modified arthropodan "hairs." Such scales are not peculiar to the Lepidoptera—they are found also on many of the Aptera, on the Psocidea, a family of Corrodentia, on some Coleoptera (beetles) and on the gnats (Culicidae), a family of Diptera. The most distinctive structural features of the Lepidoptera are to be found in the jaws. The mandibles are mere vestiges or entirely absent; the second maxillae are usually reduced to a narrow transverse mentum which bears the scale-covered labial palps, between which project the elongate first maxillae, grooved on their inner faces, so as to form when appended a tubular proboscis adapted for sucking liquid food.

All Lepidoptera are hatched as the cruciform soft-bodied larva (fig. 1, a) known as the caterpillar, with biting mandibles, three pairs of thoracic legs and with a variable number (usually five pairs) of abdominal prolegs, which carry complete or incomplete circles of hooklets. The pupa in a single family only is free (i.e., with the appendages free from the body), and mandibulate. In the vast majority of the order it is more or less obtect (i.e., with the appendages fixed to the cuticle of the body) and without mandibles (fig. 1, c).

**Structure.**—The head in the Lepidoptera is sub-globular in shape with the compound eyes exceedingly well developed, and with a pair of ocelli or "simple eyes" often present on the vertex. It is connected to the thorax by a relatively broad and membranous "neck." The feelers are many-jointed, often they are complex, the sense-organs, the processes arranged in a comb-like manner and furnished with numerous sensory hairs (fig. 2). The complexity of the feelers is carried to its highest development in certain male moths that have a wonderful power of discovering the females by smell or some analogous sense. Often the feelers are so reduced that they take no part in the feeding processes; they are then called vestigial maxillae (fig. 3, A). Throughout the order, as a whole, the jaws are adapted for sucking liquid food, and the sectorial proboscis (often erroneously called a proboscis) is formed as was shown by J. C. Savigny in 1816 by two elongated and flexible outgrowths of the first maxillae, usually regarded as representative since the maxillae are now believed to belong to the labrum, the true mandibles being perhaps represented by rounded prominences, not articulated with the head-cap. The structures are grooved along their inner faces and by means of a series of interlocking hair-like bristles can be joined together so as to form a tubular sucker (fig. 4, C). At their extremities they are beset with clubs, the sense-organs whose function is that of taste. The proboscis when in use is stretched out in front of the head and inserted into the cleft of a flower or elsewhere, for the absorption of liquid nourishment. When at rest, the proboscis is rolled up into a close spiral beneath the head and between the labial palps (fig. 4, A, P). Only in the genus Micropteryx mentioned above is the labial palps (as A. Walter has shown) developed (fig. 3, B, c). The maxillary palp is usually a mere vestige (fig. 4, B, p) though it is conspicuous in a few families of small moths. A considerable number of Lepidoptera take no food in the imaginal state; in these the maxillae are reduced or altogether atrophied. The second maxillae are intimately fused together to form the labium, which consists only of a reduced mentum, bearing sometimes vestigial lobes and always a pair of palps. These have two or three segments and are clothed with scales. The form and direction of the terminal segment of the labial palp afford valuable characters in classification.

In the thorax of the Lepidoptera the foremost segment or prothorax is very small, and not movable on the mesothorax. In many families it carries a pair of small erectile plates—the patagia—which have been regarded as serially homologous with the wings. The mesothorax is the scutum forming most of the dorsal thoracic area and small plates—though sensory hairs—are often present at the base of the forewings, as in Hyrrhopalpus. The tegulae which are beset with large hair-like scales are of the keenest conscious. The metasternum is smaller than the mesothorax. The legs are of the typical insect type, a head palp, 4, first maxilla dissected out of the Vestigial palp. Galea. Further magnified. Part transverse sections showing how the channel (A) of the proboscis is formed by the interlocking of the grooved inner faces of the flexible maxillae. The wings of the Lepidoptera may be said to dominate the structure of the insect; only exceptionally, in certain female moths, are they vestigial or absent (fig. 17). The forewing, with its prominent apex, the hindwing, and the neurosphere of the proboscis (fig. 5) are usually present in the forewing, but the hindwing, in most families, has only a single radial nerve; its anal area is, however, often more highly developed than that of the forewing. The two wings of a side are usually kept together during flight by a few stout bristles—the frenalum (fig. 5, f) projecting from the base of the costa of the hindwing and fitting beneath a membranous fold or a few thickened scales—the retinaculum—on the undersurface of the forewing. In butterflies there is no frenalum, but a costal outgrowth of the
hindwing subserves the same function. In the most primitive moths a small lobate outgrowth—the jugum (fig. 6, j)—from the dorsum of the forewing is present, but it can be of little service in keeping the two wings together. A jugum may also be present on the hindwing. The legs are much reduced or absent, and there are no wings for walking, have five-segmented feet and are covered with scales. In some families the front pair are reduced and without tarsal segments.

Ten abdominal segments are recognizable in many Lepidoptera, but the terminal segments are reduced or modified to form external organs of reproduction. In the male, according to the interpretation of C. Peyrophore, the lateral plates belonging to the ninth segment form paired claspers set in a narrow cavity on the eighth tergum; the tenth segment forms a dorsal hook—the uncus—and its sternum a ventral process or scapeium. In the female the terminal segments form, in some cases, a prostrutable ovispositor, but the typical hexapodan ovispositor with its three pairs of processes is undeveloped in the Lepidoptera.

As already mentioned, the characteristic scales on the wings, legs and body of the Lepidoptera are of cuticular nature. A complete series of transitional forms can be traced between the most elaborate and the simplest. The scales are arranged in rows (fig. 7, A), and the general cuticle is drawn out into a narrow neck or collar around the base of each scale. The scales can be easily rubbed from the surface and the series of collars in which the scales rest are then evident (fig. 7, A, c) on the wing-membrane. On the wings of many male butterflies there are specially modified scales—the androconia (fig. 7, C)—which are formed by glandular cells and diffuse a scented secretion. In some cases, the androconia are mixed among the ordinary scales; in others they are associated into conspicuous "brands" (see fig. 66). The admirable colours of the wings of the Lepidoptera are due partly to pigment in the scales as in the case of yellows, browns, reds and blues, and partly to "interference" effects from the fine striae on the scales as with the blues and greens.

A few points of interest in the internal structure of the Lepidoptera deserve mention. Each mouth opens into a sub-globose, muscular pharynx which is lined with papillae and surmounted by a capsule, where the proboscis ends. The pharynx is muscled to suck the liquid food through the proboscis and force it along the slender gut into a crop-like enlargement or diverticulum of the esophagus, which is a "food-resevoir" or "sucking-stomach." The true stomach is tubular, and beyond it lies the intestine which opens into the three segments of the rectum (fig. 9, a1). The terminal part of the intestine is of wide diameter, and in some cases given off a short caecum. The brain and the sub-esophageal ganglia are closely approximated; there are two or three thoracic and four (rarely five) abdominal ganglia. In the female each ovary has four ovarian tubes, in which the large egg-cells are enclosed in follicles and fertilized with nutritive glands. There is a special genus which in the Hesperidinae opens with the vagina on the eighth abdominal sterm. In the Micropterigidae, Eriocraniidae and the Lower Tineidae, the duct of the bursa leads into the vagina, which still opens on the eighth sternum. But in most Lepidoptera, the bursa opens into a vesicle, the vagina, and from this vesicle, distinct from the vagina, whose opening shifts back to the ninth, the duct of the bursa being connected with the vagina by a canal which opens opposite to the spermatheca. In the male, the testes are usually fused into a single mass, and the spermatic ducts open into the vasa deferentia or into the ejaculatory duct. In a few families—the Hesperidinae and Saturniidae for example—the testes retain the primitive paired arrangement. These details have been worked out by various students, among whom W. H. Jackson and W. Petersen deserve special mention. Summing up the developmental history of the genital ducts, Jackson and Petersen have described an entirely new stage, which ends with the close of larval life, an Orthopteran stage, indicated during the quiescent period preceding pupation, and a Lepidopteran stage which begins with the commencement of pupal life.

**Development**—Many observations have been made on the embryology of the Lepidoptera, for some of the more important results of these see HEXAPODA. The post-embryonic development of Lepidoptera is more familiar, perhaps, than that of any other group of animals. The egg shows great variation in its outward form, the outer envelope or chorion being in some families globular, in others flattened, in others again erect and sub-conical or cylindrical; while its surface often exhibits a beautifully regular series of ribs and furrows. Throughout the order the larva is of the form known as the caterpillar (fig. 1, a, b, fig. 8 b).

**Fig. 8 A.**—Cosus maculatus. (MacMurtrie’s Goat Moth.) N. America.

**Fig. 8 b.**—Larva of Cosus cosus. (Goat Moth.) Europe.

characterized by the presence of three pairs of jointed and clawed legs, a pair of感觉器官 and a variable number of pairs of abdominal "prolegs"—sub-cylindrical outgrowths of the abdominal segments, provided with a complete or incomplete circle of hooklets at the extremity.

There are ten abdominal segments—the ninth often small and concealed; prolegs are usually present on the third, fourth, fifth, sixth and seventh. The head of the caterpillar (fig. 9) is large and firm. The head is virtually chitinized cuticle; it exhibits usually twelve simple eyes; a pair of short feelers (fig. 9 A1) and a pair of strong mandibles (fig. 9 Mm), for the caterpillar feeds by biting leaves or other plants. The mouth parts developed in the imago, are in the larva small and inconspicuous appendages, each bearing two short jointed processes—the galea and the palps (fig. 9, Ms). The second maxillae form a plate-like labium on whose surface projects the spinneret which is usually regarded as modified hypopharynx (fig. 9, Lm). The silk-glands whose ducts open on this spinneret are paired convoluted tubes lying alongside the elongate cylindrical stomach. In the common "silkworm" these glands are five times as long as the body of the caterpillar. They are regarded as modified salivary glands, though their function is known by some students. The body of the caterpillar is usually cylindrical and worm-like, with the
segmentation well marked and the cuticle feebly chitinized and flexible. Firm chitinous plates are, however, not seldom present on the prothorax and on the hindmost abdominal segment. The segments are mostly provided with bristle or spine-bearing tubercles, which latter are sometimes set off by a thinicate plate. The spiracles are very conspicuous on the body of a caterpillar, occurring on the prothorax and on the first eight abdominal segments. Various tubercles may become coalesced or aborted (fig. 10, B); often, in conjunction with the spines that they bear, the tubercles serve as a valuable protective armature for the caterpillar. Much discussion has taken place as to whether the abdominal prolegs are or are not developed directly from the embryonic abdominal appendages. In the more lowly families of Lepidoptera, these organs are provided with the extremity with a complete circle of hooklets, but in the more highly organized families, only the inner half of this circle is retained.

The typical Lepidopterous pupa, or "chrysalis," as shown in the higher families, is an oblong pupa (fig. 11) with no trace of mandibles, the appendages being glued to the body by an exudation, and air in front of the flower by means of excessively rapid vibration of the wings, and quickly unrolling the proboscs sip the nectar. Certain flowers with remarkably long tubular corollas seem to be specially adapted for the visits of hawk moths. Some Lepidoptera have other sources of food-supply. The juices of fruit are often sought for, and certain moths can pierce the envelope of a succulent fruit with the rough cuticular outgrowths at the tips of the maxillae, so as to reach the soft tissue within. Animal juices attract other Lepidoptera, which have been observed to suck blood from a wounded mammal; while putrid meat is a familiar "lure" for the gorgeous "purple emperor" butterfly (Apatula irta). The water of streams or the dew on leaves may be frequently sought by Lepidoptera desirous of quenching their thirst, possibly with fatal results, the insects being sometimes drowned in rivers in large numbers. Members of several families of the Lepidoptera—the Hepialidae, Lasiocampidae and Saturniidae, for example—have the maxillae vestigial or aborted, and take no food at all after attaining the winged condition. In such insects there is a complete "division of labour" between the larval and the imaginal instars, the former being entirely devoted to nutritive, the latter to reproductive functions.

Of much interest is the variety displayed among the Lepidoptera in the season and the duration of the various instars. The brightly colored Vanessa butterflies, for example, emerge from the pupa in the late summer and live through the winter in sheltered situations, reappearing to lay their eggs in the succeeding spring. Many species, such as the vapourer moths (Orgyia), lay eggs in the autumn, which remain unhatched through the winter. The eggs of the well-known magpie moths (Abraxas) hatch in autumn and the caterpillar hibernates while still quite small, awaiting for its growth the abundant food-supply to be afforded by the next year's foliage. The codlin moths (Carposca) pass the winter as resting full-grown larvae, which seek shelter and spin cocoons in autumn, but do not pupate until the succeeding spring. Lastly, many of the Lepidoptera hibernate in the larval stage; thus the death's head moth (Acherontia) and the cabbage-white butterflies (Pieris) are familiar examples of such. The last-named insects afford instances of the "double-brooded" condition, two complete life-cycles being passed through in a year. The flour moth (Ephestia kühniella) is said to have five successive generations in a twelvemonth. On the other hand, certain species whose larve feed in wood or on roots take two or three years to reach the adult stage.

The rate of growth of the larva depends to a great extent on the nature of its food, and the feeding-habits of caterpillars afford much of interest and variety to the student. The contrast among the Lepidoptera between the suckorial mouth of the imago and the biting jaws of the caterpillar is very striking (cf. figs. 4 and 9), and the profound transformation in structure which takes place is necessarily accompanied by the change from solid to liquid food. The first meal of a young caterpillar is well楼房 to be other than an empty egg-shell; from this it turns to feed on the leaves whereas its progenitor has laid her eggs. But in a few cases hatching takes place in winter or early spring, and the young larvae have then to find a temporary food, until their own special plant is available. For example, the caterpillars of some species of Xanthia and other noctuid moths feed at first upon willow-catskins. On the other hand, the caterpillars of the moth (Blástodacna) hatched at midsummer, feed on leaves when young, and burrow into woody shoots in autumn. All who have tried to rear caterpillars know that, while those of some species will feed only on one particular species of plant, others will eat several species of the same genus or family, while others again are still less particular, some being able to feed on almost any green herb. It is curious to note how certain species change their food in different localities, a caterpillar confined to one plant in some localities being less particular elsewhere. Individual aberrations in food are of special interest in suggesting the starting-point for a change in the race. When we consider the vast numbers of the Lepidoptera and the structural modifications which they have undergone, their generally faithful adherence to a vegetable diet is remarkable.
of caterpillars eat leaves, usually devouring them openly, and, if of large size, quickly reducing the amount of foliage on the plant. But many small caterpillars keep, apparently for the sake of concealment, to the under surface of the leaf, while others burrow into the green tissue, forming a characteristic sinuous “mine” between the two leaf-skins. In several families we find the habit of burrowing in woody stems,—the “goat” (Cassia, fig. 8) and the clearings (Sesiidae), for example, while others, like the larvae of the swift moths (Hepialidae) live underground devouring roots (fig. 12). The richer nutrition in the green food is usually shown by the quicker growth of the numerous caterpillars that feed on it, as compared with the slower development of the wood and root-feeding species. Aquatic larvae are very rare among the Lepidoptera. The caterpillars of the pyralid “china-mark” moths (Hydrocampus, fig. 13), however, live under water, feeding on duckweed (Lemma) and breathing atmospheric air, a film of which is enclosed in a spun-up shelter beneath the leaves, while the larvae of Paraponyx, which feed on Stratiotes, have closed spiracles and breathe dissolved air by means of branchial filaments along the sides of the body.

Fig. 12.—Larva of Hepialus humuli (ghost moth).

Fig. 13.—Hydrocampus aquaticus (water moth).

We may now turn to instances of more anomalous modes of feeding. The clothes moths (Tineaids) have invaded our dwellings and found a congenial food-stuff for their larvae in our garments. A few small species of the same group are reared in meal and other human food-stores; so are the caterpillars of some pyralid moths (Ephestia), while others (Asopis, Aglossa) feed upon kitchen refuse. Two species of crabid moth (Aphomia sociella and Galleria melonella) find a home in bee-hives, where their caterpillars feed upon the wax, while the waxy secretion from the body of the great American lantern-fly (Fulgora candelaria) serves both as shelter and food for the caterpillar of the moth Epipryrops anomala. Very few caterpillars have developed a thoroughly carnivorous habit. That of Cosmia trapezina feeds on oak and other leaves, but devours smaller caterpillars which happen to get in its way, and if shaken from the tree, eats other larvae while climbing the trunk. Xylina ornithopus and a few other species are said to be always carnivorous when opportunity offers; the small looping caterpillar of a “pug” moth (Euptychæa coronata) has been observed to eat a larva three times as big as itself. The caterpillars of Orthia pisiana live together in peace while their food is moist, but devours other when it dries up; this is true cannibalism—a term which should not be applied to the habit of preying on another species. A few carnivorous caterpillars do not attack other caterpillars, but prey upon insects of another order; among these Fenesia tarquinia, which eats aphides, and Erasistria scitula, which feeds upon scale insects, must be reckoned as benefactors to mankind. The life-history of the latter moth has been worked out by H. Rouzaud. It inhabits the shores of the Mediterranean, and its caterpillar devours the coccids upon various fruit-trees, especially the black-scale (Lecanium oleae) of the olive. The moth, which is a small noctuid, the white markings on whose wings give it the appearance of a bird-dropping when at rest in the daytime, appears in May, and lays her eggs, singly and far apart, upon the trees infested by the coccids. When hatched, the young caterpillar selects a large female coccid, eats its way through the scale, and devours the insect beneath; having done this it makes its way to a fresh victim. As it increases in size it forms a case for itself made of the scales of its victims, excrement, &c., bound together by silk which it spins, and, protected by this covering, which closely resembles the smut-covered bark of the tree, it roams about during its later stages, devouring several coccids every day. So nutritious is the food, that four or five successive broods follow each other through the summer.

The habit just mentioned of forming some kind of protective covering out of foreign substances spun together by silk is practised by caterpillars of different families. The clothes moth larvae (Tinea, fig. 14), for example, make a tubular dwelling out of the pellets of wool passed from their own intestines, while the allied Tortricid caterpillars roll up leaves and spin for themselves cylindrical shelters. The habit of spinning over the food plant a protective mass of web, wherenon the caterpillars of a family can live together socially is not uncommon. In the case of the small ermine moths (Yponomeuta) the caterpillars remain associated throughout their lives and pupate in cocoons on the mass of web produced by their common labour. But the larger, spiny caterpillars of the Vanessa butterflies usually scatter away from the nest of their infancy when they have attained a certain size.

Spines and hairs seem to be often effective protections for caterpillars; the experiments of E. B. Poulton and others tend to show that hairy caterpillars (fig. 15) are distasteful to birds. Many caterpillars are protected by the harmony of their general green coloration with their surroundings. When the insect attains a large size—as in the case of the hawk moth (Sphinxid) caterpillars—the extensive green surface becomes broken up by diagonal dark markings (fig. 468), thus simulating the effect of light and shade among the foliage. A remarkable result of Poulton's experiments has been the establishment of a reflex effect through the skin on the colour of a caterpillar. Some species of “loopers” (Geometridae, fig. 43) for example, if placed when young among surroundings of a certain colour, become closely assimilated thereto—dark brown among dark twigs, green among green leaves. These colour-reflexes in conjunction with the elongate twig-like shape of the caterpillars and their habit of stretching themselves straight out from a branch, afford some of the best and most familiar examples of “protective resemblance.” The “terrifying attitude” of caterpillars, and the supposed resemblance borne by some of them to serpents and ‘other formidable vertebrates or arthropods, are discussed in the article MIMICRY.

The silk produced by a caterpillar is, as we have seen, often advantageous in its own life-relations, but its great use is in connexion with the pupal stage. In the life-history of many Lepidoptera, the last act of the caterpillar is to spin a cocoon which may afford protection to the pupa. In some cases this is formed entirely of the silk produced by the spinning-glands, and may vary from the loose meshwork that clothes the pupa of the
diamond-back moth (*Plutella crucifera*) to the densely waven cocoon of the silkworms (Bombycidae and Saturniidae) or the hard shell-like covering of the eggars (Lasiocampidae). Frequently foreign substances are worked up with the silk and serve to strengthen the cocoon, such as hairs from the body of the caterpillar itself, as among the "tigers" (Arctiidae) or chips of wood, as with the timber-burrowing larva of the "goat" (*Cossus*). In many families of Lepidoptera we can trace a degeneration of the cocoon. Thus, the pupae of most owl moths (Noctuidae) and hawk moths (Sphingidae) lie buried in an earthen cell. Among the butterflies we find that the cocoon is reduced to a pad of silk which gives attachment to the cremaster; in the Pieridae there is in addition a girdle of silk around the waist-region of the pupa, but the pupae of the Nymphalidae (figs. 11, 65) simply hang from the supporting pad by the tail-end. Poultan has shown that the colours of some exposed pupae vary with the nature of the surroundings of the larva during the final stage. When the pupal stage is complete the insect has to make its way out of the cocoon. In the lower families of moths it is the pupa which comes out at least partially, working itself onwards by the spines on its abdominal segments; the pupa of the primitive *Micropteryx* has functional mandibles with which it bites through the cocoon. In the higher Lepidoptera the pupa is immovable, and the imago, after the ecdysis of the pupal cuticle, must emerge. This emergence is in some cases facilitated by the secretion of an acid or alkaline solvent discharged from the mouth or from the hind-gut, which weakens the cocoon—so that the delicate moth can break through without injury.

As might be expected, the conditions to which larva and pupa are subjected have often a marked influence on the nature of the imago. An indifferent food-supply for the larva leads to a dwarving of the moth or butterfly. Many converging lines of experiment and observation tend to show that cool conditions during the pupal stage frequently induce darkening of pigment in the imago, while a warm temperature brightens the colours of the perfect insect. For example, in many species of butterfly that are double-broded, the spring brood emerging from the wintering pupae are more darkly coloured than the summer brood, but if the pupae producing the latter be subjected artificially to cold conditions, the winter form of imago results. It is usually impossible, however, to produce the summer form of the species from wintering pupae by artificial heat. From this A. Weissmann argued that the more stable winter form must be regarded as representing the true "type" of the species. Further examples of this "seasonal dimorphism" are afforded by many tropical butterflies which possess a darker "wet-season" and a brighter "dry-season" generation. So different in appearance are often these two seasonal forms that before their true relationship was worked out they had been naturally regarded as independent species. The darkening of wing-patterns in many species of Lepidoptera has been carefully studied in our own British fauna. Melanic or melanochroic varieties are specially characteristic of western and hilly regions, and some remarkable dark races (fig. 43) of certain geometrid moths have arisen and become perpetuated in the manufacturing districts of the north of England. The production of these melanic forms is explained by J. W. Tutt and others as largely due to the action of natural selection, the damp and sooty conditions of the districts where they occur rendering unusually dark the surfaces—such as rocks, tree-trunks and palings—on which moths habitually rest and so favouring the survival of dark, and the elimination of pale varieties, as the latter would be conspicuous to their enemies. Breeding experiments have shown that these melanic races are sometimes "dominant" to their parent-stock. An evidently adaptive connexion can be frequently traced between the resting situation and attitude of the insect and the colour and pattern of its wings. Moths that rest with the hindwings concealed beneath the forewings (fig. 34, f) often have the latter dull and mottled, while the former are sometimes highly coloured. Butterflies whose normal resting attitude is with the wings closed vertically over the back (fig. 63) so that the under surface is exposed to view, often have this under surface mottled and inconspicuous although the upper surface may be bright with flashing colours. Various degrees of such "protective resemblance" can be traced, culminating in the wonderful "imitation" of its surroundings shown by the tropical "leaf-butterflies" (*Kalima*), the under surfaces of whose wings, though varying greatly, yet form in every case a perfect representation of a leaf in some stage or other of decay, the butterfly at the same time disposing of the rest of its body so as to bear out the deception. How this is effected is best told by A. K. Wallace, who was the first to observe it, in his work *The Malay Archipelago*—

"...The habit of the species is always to rest on a twig and among dead or dried leaves, and in this position, with the wings closely pressed together, their outline is exactly that of a moderately sized leaf slightly curved or shrivelled. The tail of the hindwings forms a perfect stalk and touches the stick, while the insect is supported by the middle pair of legs, which are not noticed among the twigs and fibres that surround it. The head and antennae are drawn back between the wings so as to be quite concealed, and there is a little notch hollowed out at the very base of the wings, which allows the head to be retracted sufficiently."

But the British Vanessids often rest on a bare patch of ground with the brightly coloured upper surface of their wings fully exposed to view, and even make themselves still more conspicuous by fanning their wings up and down. Some genera and families of Lepidoptera, believed to secrete noxious juices that render them distasteful, are adorned with the staring contrasts of colour usually regarded as "warning" while other genera, having no harmless families sought for as food by birds and lizards, are believed to obtain complete or partial immunity by their likeness to the conspicuous noxious groups. (See Mimicry.)

Sexual dimorphism is frequent among the Lepidoptera. In many families this takes the form of more elaborate feelers in the male than in the female moth. Such complex feelers (fig. 2) bear numerous sensory (olfactory) nerve-endings and give to the males that possess them a wonderful power of discovering their mates. A single captive female of the Endromiidae or Lasiocampidae often causes hundreds of males of her species to "assemble" around her prison, and this character is made use of by collectors who want to secure specimens. In many butterflies—notably the "blues" (*Lycaenidae*)—the male is brilliant while the female is dull, and in other groups (the Danaidae for example) he is provided with scent-producing glands which the females are not provided with. This is the "alluring" function. The apparent evidence given by the sexual differences among the Lepidoptera in favour of C. Darwin's theory of sexual selection finds no support from a study of their habits. The male indeed usually seeks the female, but she appears to exercise no choice in pairing. In some cases the females is attracted by the male, and here a modified form of sexual selection appears to be operative. The ghost swift moth (*Hepialus humuli*) affords a curious and interesting example of this condition, the female showing the usual brown and buff coloration of her genus, while the wings of the male are pure white, rendering him conspicuous in the dusky evening when pairing takes place. But in the northernmost
haunts of the species, where there is no midsummer night, the male closely resembles the female in wing patterns, the development of the conspicuous white being needless. A very interesting sexual dimorphism is seen in the wingless condition of several female moths—the winter moths (Hybernia and Cheimatobia) among the Geometridae and the vapourers (Orgyia and Ocneria) among the Lymantriidae for example (fig. 17). It might be thought that the loss of power of flight by the female would seriously restrict the range of the species. In such insects, however, the caterpillars are often active and travel far.

**Distribution and Migration.**—The range of the Lepidoptera is practically world-wide; they are absent from the most remote and inhospitable of the arctic and antarctic lands, but even Kerguelen possesses a few small indigenous moths. Many of the large and dominant families have a range wide as that of the order, and certain species that have attached themselves to man—like the meal moths and the clothes moths—have become almost cosmopolitan. Interesting and suggestive restrictions of range can, however, be often traced. Although butterflies have been found in 52° N. latitude in Greenland, they are unknown in Iceland, and only a few species of the group reach New England. Three large sections of seven families, Chiloepidae and Bressolinae, of the great butterfly family Nymphalidae are peculiar to the Neotropical region, while the Morphinae, a characteristically South American group, have a few Oriental genera in India and Indo-Malaya. The Acraeinae, another section of the same family, have the vast majority of their species in Ethopic Africa, but are represented eastwards in the Oriental and Australian regions and westwards in South America. A comparison of the lepidopterous faunas of Ireland, Great Britain and the European continent is very instructive, and suggests strongly that, despite their power of flight the Lepidoptera are mostly dependent on land-connexions for the extension of their range. For example, Ireland has only forty of the seventy species of British butterflies. The range of many Lepidoptera is of course determined by the distribution of the plants on which their larvae feed.

Nevertheless certain species of powerful flight, and some that might be thought feeble on the wing, often cross sea-channels and establish or reinforce distant colonies. Caterpillars of the great beach moth (Plotosus angustatus) are found every summer feeding in British and Irish potato fields, but it is doubtful if any of the pupae resulting from them survive the winter in our climate. It is believed by Tutt that the species is only maintained by a fresh immigration of moths from the South each summer. Hosts of white butterflies (Pieris) have been frequently observed crossing the English Channel from France to Kent. Migrating swarms of Lepidoptera have often been met by sailors in mid-ocean; thus, Tutt records the presence around a sailing ship in the Atlantic of such a swarm of the rather feeble moth Desiopea pulchella, nearly 1000 m. from its nearest known habitat. This migratory instinct is connected with the gregarious habits of many Lepidoptera. For example, H. W. Bates states that at one place in South America he noticed eighty four different species flying about in enormous numbers in the sunshine, and these, with few exceptions, were males, the females remaining within the forest shades. Darwin describes a "butterfly shower," which he observed 10 m. off the South American coast, extending as far as the eye of the spectator could reach, as "even by the aid of the telescope," he adds, "it was not possible to see a space free from butterflies." Sir J. Emerson Tennent, witnessed in Ceylon a mighty host of butterflies of white or pale yellow hue, "apparently miles in breadth and of such prodigious extension as to occupy hours and even days uninterrupted in their passage." Observations at Heligoland by H. Gütke have shown that migrating moths "travel under the same conditions as migrating birds, and for the most part in their company, in an east to west direction; they fly in swarms, the numbers of which defy all attempts at computation and can only be expressed by millions." The painted lady butterfly (Pyrameis cardu) comes in repeated swarms from the Mediterranean region into northern and western Europe, while in North America companies of the monarch (Anisia archippus) invade Canada every summer from the United States, and are believed to return southwards in autumn. This latter species has, during the last half-century, extended its range south-westwards across the Pacific and reached the Austro-Malayan islands, while several specimens have occurred in southern and western England, though it has not established itself on this side of the Atlantic. It is noteworthy that the introduction of its food-plant—Asclepias—into the Sandwich Islands in 1850 apparently enabled it to spread across the Pacific.

**Fossil History.**—Our knowledge of the geological history of the Lepidoptera is but scanty. Certain Oolitic fossil insects from the lithographic stone of Solenhofen, Bavaria, have been described as moths, but it is only in Tertiary deposits that undoubted Lepidoptera occur, and these, all referable to existing families, are very scarce. Most of them come from the Oligocene beds of Florissant, Colorado, and have been described by S. H. Scudder. The paucity of Lepidoptera among the fossils is not surprising when we consider the delicacy of their structure, and though their past history cannot be traced back beyond early Cenozoic times, we can have little doubt from the geographical distribution of the living forms that the order originated with the other higher Endopterygota in the Mesozoic epoch.

**Classification.**—The order Lepidoptera contains more than fifty families, the discussion of whose mutual relationships has given rise to much difference of opinion. The generally received distinction is between butterflies or Rhopalocera (Lepidoptera with clubbed feelers, whose habit is to fly by day) and moths or Heterocera (Lepidoptera with variously shaped feelers, mostly crepuscular or nocturnal in habit). This distinction is quite untenable as a zoological conception, for the relationship of butterflies to some moths is closer than that of many families of Heterocera to each other. Still more objectionable is the division of the order into Macrolepidoptera (including the butterflies and large moths) and the Microlepidoptera (comprising the smaller moths). Most of the recent suggestions for the division of the Lepidoptera into sub-orders depend upon some single character. Thus J. H. Comstock has proposed to separate the three lowest families, which have, like caddis-flies (Trichoptera)—a jugum on each forewing, as a sub-order Jugatae, distinct from all the rest of the Lepidoptera—the Frenatae mostly possessing a frenulum on the hindwing. A. S. Packard places one family (Micropterygidae) with functional mandibles and a lacinia in the first maxilla alone in a sub-order Laciniata, all the rest of the order forming the sub-order Haustellata. T. A. Chapman divides the families with free or incompletely obsect and mobile pupae (Incompletea) from those with obsect pupae which never leave the cocoon (Obiecta), and this is probably the most natural primary division of the Lepidoptera that has as yet been suggested. Dyar puts forward a classification founded entirely on the structure of the larva, while Tutt divides the Lepidoptera into three great stirs characterized by the shape of the chorion of the egg. The primitive form of the egg is oval, globular, or flattened with the micropyle at one end; from this has apparently been derived the upright form of egg with the micropyle on top which characterizes the butterflies and the higher moths. These schemes, though helpful in pointing out important differences, are unnatural in that they lay stress on one adaptive characters to the exclusion of others equally important. Although it is perhaps best to establish no division among the Lepidoptera between the order and the family, an attempt has been made in the classification adopted in this article to group the families into tribes or super-families which may indicate their probable affinities. The systematic work of G. F. Hampson, A. R. Grote and E. Meyrick has done much to place the classification of the Lepidoptera on a sound basis, so far as the characters of the imago are concerned, but attention must also be paid to the preparatory stages if a truly natural system is to be reached.

**Jugatae.**—Three families are included in this group having in common certain primitive characters of the wings and noturation (see fig. 6),

---

**geographical and ecological notes added:**

- The painted lady butterfly (Pyrameis cardu) is a well-known species that migrates across Europe and North America.
- The monarch (Anisia archippus) travels vast distances, often crossing the Pacific Ocean.
- The geological history of Lepidoptera is still not fully understood, with fossils from Solenhofen being key examples.
- The classification of butterflies and moths is complex and evolving, with various schemes proposed over time.

---

**Additional notes:**

- The presence of certain species in specific latitudes and their migration patterns are critical for understanding their ecological roles.
- The evolution of wing structures and noturations provides insights into biodiversity and evolutionary pathways.

---

**Further reading:**

- Further details on specific species, migration patterns, and geological history can be found in contemporary scientific literature.
- The use of modern taxonomic frameworks continues to evolve, reflecting ongoing research and insights into evolutionary biology.
as well as of the larva and pupa. There is a membranous lobe or jugum near the base of the wing, and the neurites of the hindwing is closely like that of the forewing, the radial neurite being five-branched in both. The pupa has four or five movable segments, and the larval prolegs have complete circles of hooks.

The three families of the Jugatae are not very closely related to each other. The Micropterigidae (often known as Erioccephalidae), comprising a few small moths with metallic wings, are the most primitive of all Lepidoptera (Lepidoptera). The abdomen of the female carries a spermatheca piercing process, and the eggs are laid in the leaves of deciduous trees, the white larvae, with aborted legs, mining in the leaf tissue. The fully-fed larva winters in an underground cocoon and emerges in the spring as the most remarkable of all known neolectusous pupae, with relatively enormous toothed mandibles which bite a way out of the cocoon in preparation for the final change. These pupal mandibles of the Erioccephalidae, together with the nature of the imaginal maxillae in the Micropterigidae (Erioccephalidae) and the wing folding of both these families, suggest a strong relationship between the Lepidoptera and the Trichoptera.

The Heptapalidae or swift moths—the third family of the Jugatae—are in some respects specialized. The moths are of large or moderate size, with a black and white or reddish body, and having tufts of hair, vestigial feelers, and vestigial maxillae at rest. The antennae are large and clubbed. The female larvae feed on the roots and stems of plants and the pupal structure resembles that of the Trottidae and Psychidae. The distribution of the family is confined to Tropical America and the Indo-Malayan and Australian regions.

The Zygaenidae (burnet moths) are a large family of day-flying moths, closely allied to the Zygaenidae and agreeing with them in the structure of the pupa. The larva in this family is also an exposed feeder, but it is remarkable in form, being flattened and slug-like, without prolegs and adorned with curious pinacoid processes.

The Castniidae are a large family of small, narrow-winged moths, the sub-costal neurite of the hindwing being absent and the wings being for the most part destitute of scales (fig. 22). The maxillae are developed but their palps are vestigial, while the terminal segment of the labial palp is short and pointed. Many of these insects have their heads banded with black and yellow; this in conjunction with the transparent wings makes some of them like wasps or hornets in appearance. The larvae feed in the woody stems of various plants. The pupa, with four true abdominal segments, remains within its cocoon, formed with chips of wood, until the time for its final change draws near; then it works itself partly out of the tree by means of the spines on its abdominal segments.

The Nepicidae are the smallest of all the Lepidoptera, measuring only 3-8 mm. across the outspread wings, which are all laciniate and pointed at the tip. The sucking portions of the maxillae are vestigial, but the palps are long and jointed. The larvae, without
LEPIDOPTERA

thoracic limbs or prolegs, but sometimes with paired rudimentary processes on some of the segments, mine in the leaves of plants. The pupa, with four free abdominal segments in the female and five in the male, rests in a cocoon usually outside the mine.

The Adelidae are a family of delicate, but large moths with very long feelers (fig. 23) especially in the males. The larvae feed, when young, in flowers, later, protected by a flat case, they devour leaves, the pupa resembles that of the Nepticulidae in structure. The female has an ovipositor adapted for piercing plant tissues.

The Tineidae are a large and important family of small moths (figs. 14, 24, 25) with rough-haired heads, and with the maxillae and their palps usually well developed. Many of the genera have narrow pointed wings with degraded neuration. The larvae differ in their habits, some—Gracillaria—for example—mine in leaves, while others, like the well-known caterpillars of the clothes moth (Tinea), surround themselves with portable cases (fig. 14) formed by spinning together their own excrement. The female pupa has three, the male four free abdominal segments.

**Plutellidae.**

This group includes a few large families of small moths that are linked by their imaginal and larval structure to the Tineidae, to which they have often been included, and by their palpal structure to the higher groups that have yet to be considered. The moths have labial palps with slender pointed terminal segments, and narrow pointed wings, but the neuration (except in the Euchalcidinae) is less degenerate than in most Tineidae. The hairy covering of the head is smooth, and the maxillary palps are usually vestigial. The egg is flat, and the larval prolegs have complete circles of hooklets. The pupa is obtect, and free, but not more than one of them is usually present. The larva, usually with two prolegs, whose hooklets are arranged on the edge of the inner edge, while the immobile pupa is always obtect, and free, with only two free abdominal segments (the fifth and sixth) in both sexes and does not move out of the case.

Four families are included in this group. The Plutellidae (fig. 26) have the maxillary palps developed, in some genera, as slender threadlike appendages directed straight forward. The larva do not usually mine in leaves, but feed openly, keeping to the underside for protection (Plutella), or by their united labour a mass of web over the food-plant (Hyponemia). In the other three families the maxillary palps are vestigial or obsolete. The Euchalcidinae have remarkably narrow, pointed wings, and their larvae are also obtect, and free, but not more than one of them is usually present. The larva, usually with two prolegs, whose hooklets are arranged on the edge of the inner edge, while the immobile pupa is always obtect, and free, with only two free abdominal segments (the fifth and sixth) in both sexes and does not move out of the case.

**Pyralidae.**

This group includes a number of moths of delicate build with elongate legs, the maxillae and their palps being usually well developed. The forewings have two anal nervures, the hindwings three (fig. 30, h, i); in the hindwing the subcostal nervure bends towards and often connect with the radial, and the frenulum is usually present. The egg is flat.

The larva has complete circles of hooklets on its five pairs of prolegs, and the pupa (usually completely obtect) does not move at all from its cocoon. This group includes the only Lepidoptera that have aquatic larvae.

Of the families comprised in this division three deserve special mention. The Pierophoridae (plume moths, fig. 28) usually have the wings deeply cleft—a single cleft in the forewing and two in the hindwing. The hairy larvae feed openly on leaves, while the soft and hairy pupa remains attached to its cocoon by the cremaster, although it is incompletely obtect and has three or four free abdominal segments. The Orneoidae (multiplume moths) have all the wings six-cleft. Our British species, Orneodes hexadactyla (fig. 29), is an exquisite little insect, whose larva feeds on the blossoms of honeysuckle. The pupa is completely obtect, with only two free abdominal segments. The Pyralidae (figs. 13, 30), a large family with numerous divisions, have entire wings, and their pupae are obtect. The caterpillars feed in some kind of shelter, some spinning a loose case among leaves, while others burrowing into dry vegetable substances or eating the water-cells of bees.

Several species of this group, such as the Mediterranean flour moth, Ephesia kühniella (fig. 30), become serious pests in storehouses and granaries, their larvae devouring flour and similar food-stuffs.

**Noctuidae.**

In this group may be included a number of families of moths with the second median nervure of the forewing arising close to the third. This feature of neuration characterizes also the Notiidae (see fig. 6). Tineidae, Plutellidae and Pyralidae. But the Noctuidae differ from these groups in having only two anal nervures in the hindwing. The maxillary palps are absent or vestigial, and a frenulum is usually present on the hindwing. The larva has usually ten prolegs, whose hooklets are arranged on the edge of the inner edge, while the immobile pupa is always obtect, with only two free abdominal segments (the fifth and sixth) in both sexes and does not move out of the case. The larva, usually with two prolegs, whose hooklets are arranged on the edge of the inner edge, while the immobile pupa is always obtect, with only two free abdominal segments (the fifth and sixth) in both sexes and does not move out of the case.

The Lasiocampidæ, together with a few small families, differ from the majority of this group in wanting a frenulum. The maxillæ of the Lasiocampidæ are so reduced that no food is taken in the imaginal state, and in correlation with this condition the feelers of the male are strongly (those of the female more feebly) bipapillated. The moths are stout, hairy insects, usually brown or yellow in the pattern of their wings. The caterpillars are densely hairy and many species hibernate in the larval stage. The pupa is enclosed in a hard, dense cocoon, wherein the male "eggs" can be seen applied to the female, and the female "eggs" are absent. The hook-tip moths represent this family in the British fauna.

The Bombyzidae resemble the Lasiocampidæ in their hairy bodies and vestigial maxillæ, but the frenulum is not always present on the hindwing and the feelers are bipapillated only in the males. The same is true of the vaneur moth. (Orgyia and allies, fig. 17), for example—are degenerate creatures with vestigial wings. The larvae (fig. 15) are very hairy, and often carry dense tufts on some of their segments; hence the name of "tussaks," frequently applied to them. The pupa is also hairy (fig. 16)—an
exceptional condition—and are protected by a cocoon of silk mixed with some of the larval hairs, while the female sheds some hairs from her own abdomen to cover the eggs. The family is widely distributed, its headquarters being the eastern tropics. To that part of the world is restricted the allied family of the Hyspidae, and the caterpillars are often densely covered with long smooth hairs. The pupae are enclosed in silken cocoons (fig. 38). The highest specialization of structure in this group of the Lepidoptera is reached by the Syntomidae, a family nearly allied to the Arctiidae, but with the sub-costal nervure in the hindwing absent. The Syntomidae have elongate narrow forewings and short hindwings, usually dark in colour with clear spots and dashes destitute of scales (fig. 40). The body, on the other hand, is often brilliantly adorned. The family, abundant in the tropics of the Old World, has only two European species.

**Sphingidae.**

This group includes a series of families which agree with the Noctuides in most points, but are distinguished by the origin of the second median nervure of the forewing close to the first, or from the disocellular nervure midway between the first and third medians (see fig. 5). These neuronal characters may appear somewhat insignificant, but such slight though constant distinctions in structures of so adaptive value may be safely regarded as truly significant of relationship. Several of the families in this group have lost the frenulum. In larval and pupal characters the Sphingidae generally resemble the Noctuides, but in some families there is a reduction in the number of the larval prolegs. The egg is spherical or flat, upright only in the Notodontidae.

The Notodontidae are stout, hairy moths (figs. 5, 41, 42 a) with maxillae and frenulum developed. In the larva the prolegs on the hindmost segment are sometimes modified into pointed outgrowths which are carried erect when the caterpillar moves about. From these structures whip-like, coloured processes are protruded by the caterpillar (fig. 42 b) of the puss moth (*Cerura*) when alarmed; these processes are believed to help in "terrifying" the caterpillar's enemies. Allied to the Notodontidae are the Cymatophoridae—a family of moths agreeing with the Noctuidae in appearance and habits—and the large and important family of the Geometridae.
The moths (fig. 43) of this family are distinguished from the Notodontidae by their delicate build and elongate feet, the caterpillars (fig. 43, c) by the absence or vestigial condition of the three anterior pairs of prolegs. The two hinder pairs of prolegs are therefore alone functional and the larva progresses by "looping," i.e. bending the body so as to bring these prolegs close up to the thoracic legs, and then, taking a fresh grip on the twig whereon it walks, stretching the body straight out again. Many of these larvae have a striking resemblance both in form and colour to the twigs of their food-plant. In some of the species the female has the wings reduced to useless vestiges. The family is world-wide in its range. The tropical Uraniidae are large handsome moths (figs. 44, 45), often with exquisite wing-patterns, allied to the Geometridae, but distinguished by the absence of a frenulum in the moth and the presence of the normal ten prolegs in the larva.

A group of families in which the first maxillae are vestigial, the feelers bipectinate and the pupa enclosed in a dense silken cocoon, have been regarded as the most highly specialized of all the moths, though according to some views the whole series of the Lepidoptera culminates in the Syntomidae. Of these cocoon-spinning families may be specially mentioned the Eupterotidae, large brown or yellow moths inhabiting tropical Asia and Africa, and represented in Europe only by the "processionary moth" (Cnestocampa processionea). In this family the frenulum is present, and the larvae are protected with tufts of long hair. The Bombycidae have no frenulum, and...
is tropical in its distribution, but the common silkworm (Bombbyx mori, fig. 48) has become acclimatized in southern Europe and is the source of most of the silk used in manufacture and art. Of

communal value also is the silk spun by the great moths of the family Saturniidae, well represented in warm countries and contributing a single species (Saturnia pavonia-minor) to the British fauna. These moths (fig. 49) have but a single anal nervure in the hindwing and only three radial nervures in the forewing. The wing-patterns are handsome and striking; usually an unscaled "eyespot" is conspicuous at the end of each discoidal areol. The
caterpillars are protected by remarkable spine-bearing tubercles (fig. 19, B).

Grypoenidae.

This group stands at the base of the series of families that are usually distinguished as "butterflies." The feelers are recurved at the tip, and thickened just before the extremity. The forewing has the full number of radial nervures, distinct and evenly spaced, and two anal nervures; the frenulum is usually absent. The larvae (fig. 51) have prolegs with complex circles of hooklets, and often feed in concealed situations, while the pupa is protected by a light cocoon. The affinities of this group are clearly not with the higher groups of moths just described, but with some of the lower families. According to Meyrick they are most closely related to the Pyralidae, but Hampson and most other students would derive them (through the Castniidae) from a primitive Tineoid stock allied to the Cossidae and Zygaenidae.

Three families are included in the section. The North American Megathyminidae and the Australian Euchromiidae have a frenulum and are usually reckoned among the "moths." The Hesperidae in which the frenulum is wanting form the large family of the skipper butterflies, represented in our own fauna by several species. They are insects with broad head—the feelers being widely separated—usually brown or grey wings (fig. 50) and a peculiar jerky flight. The family has an extensive range but is unknown in Greenland, New Zealand, and in many oceanic islands.

Rhopalocera.

This group comprises the typical butterflies which are much more highly specialized than the Grypoenidae, and may be readily distinguished by the knobbed or clubbed feelers and by the absence of a frenulum. Two or more of the radial nervures in the forewing arise from a common stalk or are suppressed. The egg is "upright." The larvae have hooklets only on the inner edges of the prolegs. The pupa is very highly modified, only two free abdominal segments are ever recognizable, and in some genera these have become consolidated. The cocoon is reduced to a pad of silk, to which the pupa is attached, suspended by the cremastral hooks; in some families there is also a silken girdle around the waist-region. In correlation with the exposed condition of the pupa, we find the presence of a specially developed "head-piece" or "nose-horn" to protect the head-region of the contained imago. Their bright colours and conspicuous flight in the sunshine has made the Rhopalocera the most admired of all insects by the casual observer.

A modification that has taken place in several families of butterflies is the reduction of the first pair of legs. H. W. Bates arranged the families in a series depending on this character, but nomenclatorial pupal features must be taken

into account as well, and the sequence followed here is modified from that proposed by A. R. Grote and J. W. Tutt.

The Lycaenidae are a large family including the small butterflies (figs. 58, 59, 54) popularly known as blues, coppers and hairstreaks. The forelegs in the female are normal, but in the male the tarsal segments are shortened and the claws sometimes are absent. The forewing has only three or four radial nervures (fig. 53), the last two of which arise from a common stalk; the feelers are inserted close together on the head. The males are short and hairy, somewhat like a woodlouse in shape, the broad sides concealing the legs and prolegs, while the pupa, which is also hairy or bristly, is attached by the cremaster to a silken pad and cinctured with a silken thread. The upper surfaces of the wings of these insects are usually of a bright metallic hue—blue or coppery—while beneath there are often numerous dark centres "eye-spots." The family is widely distributed. Nearly related are the Lemoniidae, a family abundantly represented in the Neotropical Region, but scarce in the Old World and having only a single European species (Nemocobis lucinia) which occurs also in England. In the Lemoniidae (figs. 56, 57) the fore of the male are reduced and useless for walking. The Lithycidae may be recognized by the elongate snout-like palps,
LEPIDOPTERA

The five-branched radial nervure of the forewing, the cylindrical hairy larva, and the pupa attached only by the cremaster.

The Papilionidae are large butterflies with ample wings, and all six legs fully developed in both sexes. The forewing has five radial and two anal nervures, the second of the latter being free from the first and running to the dorsum of the wing, while the hindwing has but a single anal, and is frequently prolonged into a "tail" at the third median nervure (fig. 58). The larva is cylindrical, never hairy but often tuberculate and provided with a dorsal retractile tentacle (osmaterium) on the prothorax. The pupa, which has a double "nose-horn," is attached by the cremaster and a waist-girdle to the food-plant in the Papilioninae (fig. 58), but lies in a web on the ground among the Parnasinae (figs. 59, 60). The latter sub-family includes the well-known Apollo butterflies of the Alps.

The former is represented in the British fauna by the East Anglian swallow-tail (Papilio machaon), and is very abundant in the warmer regions of the world, including some of the most magnificent and brilliant of insects.

Agreeing with the Papilionidae in the six perfect legs of both sexes and the cincture-support of the pupa we find the Pieridae—the family of the white and yellow butterflies (figs. 61, 62)—represented by tenspecies in the British fauna and very widely spread over the earth's surface. In the Pieridae there are two anal nervures in the hindwing, while the second anal nervure in the forewing runs into the first; the larva is cylindrical and hairy without an osmaterium. The pupa has a single "nose-horn," and in the more highly organized genera there is no mobility whatever between its abdominal segments. The wintering pupae of the common cabbage butterflies (Pieris brassicae and P. rapae) are common objects attached to walls and fences and their colour harmonizes, to a great extent, with that of their surroundings.

The Nymphalidae are by far the largest and most dominant family of butterflies. In both sexes the forelegs are useless for walking (fig. 63), the tarsal segments being absent and the short shins clothed with long hairs, whence the name of brush-footed butterflies is often applied to the family. The neuration of the wings resembles that found among the Pieridae, but in the Nymphalidae the pupa, which has a double nose-horn (fig. 65)—as in Papilio—is suspended from the cremaster only, no girdling thread being present, or it lies simply on the ground. The egg is elongate and sub-conical in form and ornamented with numerous ribs, while the larva is usually protected by numerous spines (fig. 64) arising from the segmental tubercles. To this family belong our common gaily-coloured butterflies—the tortoiseshells, peacock (fig. 65), admirals, fritillaries.
LEPIDOPTERA

and emperors. In most cases the bright colouring is confined to the upper surface of the wings, the under-side being mottled and often inconspicuous. Most members of the group Vanessa—the peacock and tortoiseshells (Vanessa) and the red admiral (Pyranthes) for example—hibernate in the imaginal state. This large family is divided into several sub-families whose characters may be briefly given, as they are considered to be distinct families by many entomologists. The Danainae (or Euploea, fig. 66) have the anal nervures of the forewing arising from a common stalk, the discoidal areolets in both wings closed, and the front feet of the female thickened; their larvae are smooth with fleshy processes. The danaine butterflies range over all the warmer parts of the world, becoming most numerous in the eastern tropics, where flourish the handsome purple Euploea whose males often have "brands" on the wings; these insects are conspicuously marked and are believed to be distasteful to birds and lizards. So are the South American Ithominae, distinguished from the Danainae by the slender feet of the females; the narrow winged, tawny Acrainae, with simple anal nervures, thick hairy palps and spiny larvae; and the Heliconiinae whose palps are compressed, scaly at the sides and hairy in front. This last named sub-family is confined to the Neotropical Region, while the Acrainae are most numerous in the Ethiopian. The Nymphalinae include the British vanessids (fig. 65), and a vast assemblage of exotic genera (figs. 68, 70), characterized by the "open" discoidal areolets (fig. 67) owing to the absence of the transverse "disco-cellular" nervules. In the Morphinae—including some magnificent South American insects with deep or azure blue wings, and a few rather dull-coloured Oriental genera—the areolets are closed in the forewings and often in the hindwings. The larvae of the Morphinae (fig. 71) are smooth.
LEPIDUS

or hairy with a curiously forked tail-segment. A similar larva characterizes the South American Brassoïnae or owl-butterflies—

including our native browns and the Alpine Erebiæ, resemble the foregoing group in many respects of structure, but the sub-costal nervure is greatly thickened at the base (fig. 74). This sub-family is world-wide in its distribution. One genus (Oeneis, fig. 75) is found in high northern latitudes, but reappears in South America. The species, split into twelve genera, are familiar butterflies among the Alps; yet butterflies nearly related to these Alpines occur in Patagonia, in South Africa and in New Zealand. Such facts of distribution clearly show that though the Nymphalidae have attained a high degree of specialization among butterflies, some of their genera have a history which goes back to a time when the distribution of land and water on the earth's surface must have been very different from what it is to-day.

(Ch. C.)

LEPIDUS, the name of a Roman patrician family in the Aemilian gens.

1. Marcus Aemilius Lepidus, one of the three ambassadors sent to Egypt in 201 B.C. as guardians of the infant king Ptolemy V. He was consul in 187 and 175, censor 179, pontifex maximus from 180 onwards, and was six times chosen by the censors princeps senatus. He died in 152. He distinguished himself in the war with Antiochus III. of Syria, and against the Ligurians. He made the Via Aemilia from Ariminum to Placentia, and led colonies to Mutina and Parma.

Livy xl. 42-46, epit. 48; Polybius xvi. 34.

2. Marcus Aemilius Lepidus, surnamed Porcinus (probably from his personal appearance), consul 137 B.C. Being sent to Spain to conduct the Numantine war, he began against the will of the senate to attack the Vaeclae. This enterprise was so unsuccessful that he was deprived of his command in 136 and condemned to pay a fine. He was among the greatest of the earlier Roman orators, and Cicero praises him for having
introduced the well-constructed sentence and even flow of language from Greek into Roman oratory.

3. Marcus Aemilius Lepidus, father of the triumvir. In 81 B.C. he was praetor of Sicily, where he made himself detested by oppression and extortion. In the civil wars he sided with Sulla and bought much of the confiscated property of the Marian partisans. Afterwards he became leader of the popular party, and with the help of Pompey he was elected consul for 78, in spite of the opposition of Sulla. When the dictator died, Lepidus tried in vain to prevent the burial of his body in the Campus Martius, and to alter the constitution established by him. His colleague Lutatius Catulus found a tribunal to place his veto on Lepidus's proposals; and the quarrel between the two parties in the state became so acute that the senate made the consuls swear not to take up arms. Lepidus was then ordered by the senate to go to his province, Transalpine Gaul; but he stopped in Etruria on his way from the city and began to levy an army. He was declared a public enemy early in 77, and forthwith marched against Rome. A battle took place in the Campus Martius, Pompey and Catulus commanding the senatorial army, and Lepidus was defeated. He sailed to Sardinia, in order to put himself into connexion with Sertorius in Spain, but here also suffered a repulse, and died shortly afterwards.

Plutarch, Sulla, 34, 38; Pompey, 15; Appian, B.C. i. 106, 107; Livy, *epit.* 90; Florus iii. 23; Cicero, *Balbus*, 15.

4. Marcus Aemilius Lepidus, the triumvir. He joined the party of Julius Caesar in the civil wars, and was by the dictator thrice nominated *magister equitum* and raised to the consulsip in 46 B.C. He was a man of great wealth and influence, and it was probably more on this ground than on account of his ability that Caesar raised him to such honours. In the beginning of 44 B.C. he was sent to Gallia Narbonensis, but before he had left the city with his army Caesar was murdered. Lepidus, as commander of the only army near Rome, became a man of great importance in the troubles which followed. Taking part with Marcus Antonius (Mark Antony), he joined in the reconciliation which the latter effected with the senatorial party, and afterwards sided with him when open war broke out. Antony, after his defeat at Mutina, joined Lepidus in Gaul, and in August 43 Octavian (afterwards the emperor Augustus), who had forced the senate to make him consul, effected an arrangement with Antony and Lepidus, and their triumvirate was organized at Bononia. Antony and Octavian soon reduced Lepidus to an inferior position. His province of Gaul and Spain was taken from him; and, though he was included in the triumvirate when it was renewed in 37, his power was only nominal. He made an effort in the following year to regain some reality of power, conquered part of Sicily, and claimed the whole island as his province, but Octavian found means to sap the fidelity of his soldiers, and he was obliged to supplicate for his life. He was allowed to retain his fortune and the office of *pontifex maximus* to which he had been appointed in 44, but had to retire into private life. According to Suetonius (*Augustus*, 16) he died at Circeii in the year 13.

**LE PLAY—LEPROSY**

LE PLAY, PIERRE GUILLAUME FRÉDRIC (1806-1882), French engineer and economist, was born at La Rivière-Saint-Sauveur (Calvados) on the 11th of April 1806, the son of a custom-house official. He was educated at the École Polytechnique, and from there passed into the State Department of Mines. In 1834 he was appointed head of the permanent committee of mining statistics, and in 1840 engineer-in-chief and professor of metallurgy at the school of mines, where he became director in 1848. For nearly a quarter of a century Le Play spent his vacations travelling in the various countries of Europe, and collected a vast quantity of material bearing upon the social condition of the working classes. In 1855 he published *Les Ouvriers européens*, which comprised a series of thirty-six monographs on the budgets of typical families selected from the most diverse industries. The Académie des Sciences conferred on him the Montyon prize. Napoleon III., who held him in high esteem, entrusted him with the organization of the Exhibition of 1855, and appointed him councillor of state, commissioner general of the Exhibition of 1857, senator of the empire and grand officer of the Legion of Honour. He died in Paris on the 5th of April 1882.

In 1856 Le Play founded the *Société internationale des études pratiques d'Economie sociale*, which has devoted its energies principally to forwarding social studies on the lines laid down by its founder. The journal of the society, *La Réforme sociale*, founded in 1881, is published once a month. Le Play was also chief editor of the *Revue trimestrielle d'histoire et de géographie sociale* (2 vols., 1884; 7th ed., 3 vols., 1887); *L'Organisation de la famille* (1871); *La Constitution de l'Angleterre* (in collaboration with M. Delairé, 1875). See article in *Harvard Quarterly Journal of Economics* (June 1890), by H. Joesting.

**LEPROSY** (Lepra Arabum, *Elephantiasis Gracorum*, Aussata, Spadalshuk), the greatest disease of medieval Christendom, identified, is, the one hand, with a disease endemic from the earliest historical times (1500 B.C.) in the delta and valley of the Nile, and, on the other hand, with a disease now common in Asia, Africa, South America, the West Indies, and certain isolated localities of Europe. An authentic representation of the leprosy of the middle ages exists in a picture at Munich by Holbein, painted at Augsburg in 1516; St Elizabeth gives bread and wine to a prostrate group of lepers, including a bearded man whose face is covered with large round reddish knobs, an old woman whose arm is covered with brown blotches, the leg swathed in bandages through which matter oozes, the bare knee also marked with discoloured spots, and on the head a white rag or plaster, and, thirdly, a young man whose neck and face (especially round the somewhat hairless eyebrows) are spotted with brown patches of various size. It is conjectured by Virchow that the painter had made studies of lepers from the leper-houses then existing at Augsburg. These external characters of medieval leprosy agree with the disease depicted by the ancients, and with the pictures of modern leprosy given by Danielssen and Boeck for Norway, by various authors for sporadic European cases, by Anderson for Malacca, by Carter for India, by Wolff for Madeira and by Hills for British Guiana. There has been some confusion in the technical name of the disease; it is called *Elephantiasis* (Leontiasis, Satyriasis) by the Greek writers, and *Lepræ* by the Arabs.

Leprosy is now included among the parasitic diseases (see *Parasitic Diseases*). The cause is believed to be infection by the bacillus leprae, a specific microbe discovered by Armauer Hansen in 1871. It is worthy of note that tuberculosis is very common among lepers, and especially attacks the serous membranes. The essential character of leprosy is a great multiplication of cells, resembling the "granulation cells" of lupus and syphilis, in the tissues affected, which become infiltrated and thickened, with degeneration and destruction of their normal structure. The new cells vary in size from ordinary leucocytes to giant cells three or four times larger. The bacilli are found in these cells, sometimes in small numbers, sometimes in masses. The structures most affected are the skin, nerves, mucous membranes and lymphatic glands.

The symptoms arise from the anatomical changes indicated, and they vary according to the parts attacked. Three types of disease are usually described—(1) nodular, (2) smooth or anaesthetic, (3) mixed. In the first the skin is chiefly affected, in the second the nerves; the third combines the features of both. It should be understood that this classification is purely a matter of convenience, and is based on the relative prominence of symptoms, which may be combined in all degrees. The incubation period of leprosy—assuming it to be due to infection—is unknown, but cases are on record which can only be explained on the hypothesis that it may be many years. The invasion is usually slow and intermittent. There are occasional feverish attacks, with the usual constitutional disturbances and other slight premonitory signs, such as changes in the colour of the skin and in its sensibility. Sometimes, but rarely, the onset is acute and the characteristic symptoms develop rapidly. These begin with
LEPROSY

an eruption which differs markedly according to the type of disease. In the nodular form, dark red or coppery patches appear on the face, backs of the hands, and feet, or on the body; they are generally symmetrical, and vary from the size of a shilling upwards. They come with one of the feverish attacks and fade away when it has gone, but only to return. After a time infiltration and thickening of the skin become noticeable, and the nodules appear. They are lumpy excrescences, at first pink but changing to brown. Thickening of the skin of the face produces a highly characteristic appearance, recalling the aspect of a lion. The tissues of the eye undergo degenerative changes; the mucous membrane of the nose and throat is thickened, impairing the breathing and the voice; the eyebrows fall off; the ears and nose become thickened and enlarged. As the disease progresses the nodules tend to break down and ulcerate, leaving open sores. The patient, whose condition is extremely wretched, gradually becomes weaker, and eventually succumbs to exhaustion or is carried off by some intercurrent disease, usually inflammation of the kidneys or tuberculosis. A severe case may end fatally in two years, but, as a rule, when patients are well cared for the illness lasts several years. There is often temporary improvement, but complete recovery from this form of leprosy rarely or never occurs. The smooth type is less severe and more chronic. The eruption consists of patches of dry, slightly discoloured skin; not elevated above the surface. There are the result of morbid changes affecting the cutaneous nerves, and are accompanied by diminished sensibility over the areas of skin affected. At the same time certain nerve trunks in the arm and leg, and particularly the ulnar nerve, are found to be thickened. In the further stages the symptoms are those of increasing degeneration of the nerves. Bullae form on the skin, and the discoloured patches become enlarged; sensation is lost, muscular power diminished, with wasting, contraction of tendons, and all the signs of impaired nutrition. The nails become hard and clawed; perforating ulcers of the feet are common; portions of the extremities, including whole fingers and toes, die and drop off. Later, paralysis becomes more marked, affecting the muscles of the face and limbs. The disease runs a very chronic course, and may last twenty or thirty years. Recovery occasionally occurs. In the mixed form, which is probably the most common, the symptoms described are combined in varying degrees. Leprosy may be mistaken for syphilis, tuberculosis, ainhum (an obscure disease affecting negroes, in which the little toe drops off), and several affections of the skin. Diagnosis is established by the presence of the bacillus leprae in the nodules or bullae. The signs of cutaneous sensitisation exhibited by the anaesthetic patches of skin and the thickened nerve trunks.

In former times leprosy was often confounded with other skin diseases, especially psoriasis and leucoderma; the white leprosy of the Old Testament was probably a form of the latter. But there is no doubt that true leprosy has existed from time immemorial. Prescriptions for treating it have been found in Egypt, to which a date of about 4000 B.C. is assigned. The disease is described by Aristotle and by later Greek writers, but not by Hippocrates, though leprosy derives its name from his "lepra" or "scaly" disease, which was no doubt psoriasis. In ancient times it was widely prevalent throughout Asia as well as in Egypt, and among the Greeks and Romans. In the middle ages it became extensively diffused in Europe, and in some countries—France, England, Germany and Spain—very considerable town had its leper-house, in which the patients were segregated. The total number of such houses has been reckoned at 19,000. The earliest one in England was established at Canterbury in 1096, and the latest at Highgate in 1472. At one time there were at least 65 religious hospitals for lepers in Great Britain and 14 in Ireland (Sir James Simpson). During the 15th century the disease underwent great diminution. It practically disappeared in the civilized parts of Europe, and the leper-houses were given up. It is a singular fact that this diminution was coincident with the great extension of syphilis (see PROSTITUTION). The general disappearance of leprosy at this time is more unintelligible because it did not take effect everywhere. In Scotland the disease lingered until the 19th century, and in some other parts it has never died out at all. At the present time it still exists in Norway, Iceland, along the shores of the Baltic, in South Russia, Greece, Turkey, several Mediterranean islands, the Riviera, Spain and Portugal. Isolated cases occasionally occur elsewhere, but they are usually imported. The Teutonic races seem to be especially free from the taint. Leper asylums are maintained in Norway and at two or three places in the Baltic, San Remo, Cyprus, Constantinople, Alicante and Lisbon. Except in Spain, where some increase has taken place, the disease is dying out. The number of lepers in Norway was 3000 in 1856, but has now dwindled to a few hundreds. They are no longer numerous in any part of Europe. On the other hand, leprosy prevails extensively throughout Asia, from the Mediterranean to Japan, and from Arabia to Siberia. It is also found in nearly all parts of Africa, particularly on the east and west coasts near the equator. In South Africa it has greatly increased, and attacks the Dutch as well as natives. Leper asylums have been established at Robben Island near Cape Town, and in Tembulpul. In Australia, where it was introduced by Chinese, it has also spread to Europeans. In New Zealand the Maoris are affected; but the amount of leprosy is not large in either country. A much more remarkable case is that of the Hawaiian Islands, where the disease is believed to have been imported by Chinese. It was unknown before 1846, but in 1866 the number of lepers had risen to 230 and in 1882 to 4000 (Living). All attempts to stop it by segregating lepers in the settlement of Molokai appear to have been fruitless. In the West Indies and on the American continent, again, leprosy has a wide distribution. It is found in nearly all parts of South and Central America, and in certain parts of North America—namely, Louisiana, California (among Chinese), Minnesota, Wisconsin and South Dakota (Norwegians), New Brunswick (French Canadians).

It is difficult to find any explanation of the geographical distribution and behaviour of leprosy. It seems to affect islands and the sea-coast more than the interior, and to some extent this gives colour to the old belief that it is caused or fostered by a fish diet, which has been revived by Mr Jonathan Hutchinson, but is not generally accepted. Leprosy is found in interiors where fish is not an article of diet. Climate, again, has obviously little, if any, influence. The theory of heredity is equally at fault, whether it be applied to account for the spread of the disease by transmission or for its disappearance by the elimination of susceptible persons. The latter is the manner in which leprosy might be if it was contagious, for leprosy is remarkably sterile. But we see the disease persisting among the Eastern races, who have been continuously exposed to its selective influence from the earliest times, while it has disappeared among the Europeans, who were affected very much later. The opposite theory of hereditary transmission from parents to offspring is also at variance with many observed facts. Leprosy is very rarely congenital, and no cases have occurred among the descendants to the third generation of 160 Norwegian lepers settled in the United States. Again, if hereditary transmission were an effective influence, the disease could hardly have died down so rapidly as it did in Europe in the 15th century. Then we have the theory of contagion. There is no doubt that human beings are inoculable with leprosy, and that the disease may be communicated by close contact. Cases have been recorded which prove it conclusively; for instance, that of a man who had never been out of the British islands, but developed leprosy after sharing for a time the bed and clothes of his brother, who had contracted the disease in the West Indies. Some of the facts noted, such as the extensive dissemination of the disease in Europe during the middle ages, and its subsequent rapid decline, suggest the existence of a mild and its subsequent rapid decline, suggest the existence of an endemic factor. Poverty and insanitation are said to go with the prevalence of leprosy, but they go with every malady, and there is nothing to show that they have any special influence. Vaccination has been blamed for spreading it, and a few cases of communication by arm to arm inoculation are recorded. The influence of this
factor, however, can only be trifling. Vaccination is a new thing, leprosy a very old one; where there is most vaccination there is no leprosy, and where there is most leprosy there is no or no vaccination. In India 78% of the lepers are unvaccinated, and in Canton since vaccination was introduced leprosy has declined (Cantlie). On the whole we must conclude that there is still much to be learnt about the conditions which govern the prevalence of leprosy.

With regard to prevention, the isolation of patients is obviously desirable, especially in the later stages, when open sores may disseminate the bacilli; but complete segregation, which has been urged, is regarded as impracticable by those who have had most experience in leprous districts. Scrupulous cleanliness should be exercised by persons attending on lepers or brought into close contact with them. In treatment the most essential thing is general care of the health, with good food and clothing. The tendency of modern therapeutics to attach increasing importance to nutrition in various morbid states, and perhaps in diseases of degeneration, such as tuberculosis and affections of the nervous system, is borne out by experience in leprosy, which has affinities to both; and this suggests the application to it of modern methods for improving local as well as general nutrition by physical means. A large number of internal remedies have been tried with varying results; those most recommended are chaulmoogra oil, arsenic, salicylate of soda, salol and chlorate of potash. Vergyueira uses Collargol intravenously and subcutaneously, and states that in all the cases treated there was marked improvement, and hair that had been lost grew again. Calmette's Anterennere injected subcutaneously has been followed by good results. Deycke together with R. Bey isolated from a non-ulerated leperous nodule a streptothrix which they call S. leproides. Its relation to the bacillus is uncertain. They found that injections of this organism had much curative power, due to a neutral fat which they named "Nastin." Injections of Nastin together with Benzoyl Chloride directed on the lepra bacilli. Some cases were unaffected by this treatment, but with others the effect was marvellous. Dr W. A. Pusey of Chicago uses applications of carbon dioxide snow with good effect. In the later stages of the disease there is a wide field for surgery, which is able to give much relief to sufferers.

LEPSIUS, KARL RICHARD (1810–1884), German Egyptologist, was born at Naumburg-am-Saale on the 23rd of December 1810, and in 1823 was sent to the "Schulpforta" school near Naumburg, where he came under the influence of Professor Lange. In 1829 he entered the university of Leipzig, and one year later that of Göttingen, where, under the influence of Oftried Muller, he finally decided to devote himself to the archaeological side of philology. From Göttingen he proceeded to Berlin, where he graduated in 1833 as doctor with the thesis De tableis Eugubinis. In the same year he proceeded to study in Paris, and was commissioned by the duc de Luynes to collect material from the Greek and Latin writers for his work on the weapons of the ancients. In 1834 he took the Voney prize with his Palographie als Mittel der Sprachforschung. Befriended by Bunsen and Humboldt, Lepsius threw himself with great ardour into Egyptological studies, which, since the death of Champollion in 1832, had attracted no scholar of eminence and weight. Here Lepsius found an ample field for his powers. After four years spent in visiting the Egyptian collections of Italy, Holland and England, he returned to Germany, where Humboldt and Bunsen united their influence to make his projected visit to Egypt a scientific expedition with royal support. For three years Lepsius and his party explored the whole of the region in which monuments of ancient Egyptian and Ethiopian occupation are found, from the Sudan above Khartum to the Syrian coast. At the end of 1845 they returned home, and the results of the expedition, consisting of casts, drawings and squeezes of inscriptions and scenes, maps and plans collected with the utmost thoroughness, as well as antiquities and papyri, far surpassed expectations. In 1846 he married Elisabeth Klein, and his appointment to a professorship in Berlin University in the following August afforded him the leisure necessary for the completion of his work. In 1859 the twelve volumes of his vast Denkmäler aus Ägypten und Äthiopien were finished, supplemented later by a text prepared from the note-books of the expedition; they comprise its entire archaeological, palaeographical and historical results. In 1866 Lepsius again went to Egypt, and discovered the famous Decree of Tanis or Table of Canopus, an inscription of the same character as the Rosetta Stone, in hieroglyphic, demotic and Greek. In 1873 he was appointed keeper of the Royal Library, Berlin, which, like the Berlin Museum, owes much to his care. About ten years later he was appointed Geheimer Oberregierungsrath. He died at Berlin on the 1st of July 1884. Besides the colossal Denkmäler and other publications of texts such as the Totenbuch der Ägypter (Book of the Dead, 1842) his other works, amongst which may be specially named his Königsbuch der Ägypter (1858) and Chronologie der Ägypter (1840), are characterized by a quality of permanence that is very remarkable in a subject of such rapid development as Egyptology. In spite of his scientific training in philology Lepsius left behind few translations of inscriptions or discussions of the meanings: by preference he attacked historical and archaeological problems connected with the ancient texts, the alphabet, the metrology, the names of metals and minerals, the chronology, the royal names. On the other hand one of his latest works, the Nubische Grammatik (1880), is an elaborate grammar of the then little-known Nubian language, preceded by a linguistic sketch of the continent. Throughout his life he profited by the gift of attaching himself to the right men, whether as patrons or, like Weidenbach and Stern, as assistants. Lepsius was a fine specimen of the best type of German scholar.

See Richard Lepsius, by Georg Ebers (New York, 1887), and art. EGYPT, section Exploration and Research.

LEPTINES, an Athenian orator, known as the proposer of a law that no Athenian, whether citizen or resident alien (with the sole exception of the descendants of Harmodius and Aristogeiton), should be exempt from the public charges (mestaypeis) for the state festivals. The object was to provide funds for the festivals and public spectacles at a time when both the treasury and the citizens generally were short of money. It was further asserted that many of the recipients of immunity were really unworthy of it. Against this law Demosthenes delivered (554 B.C.) his well-known speech Against Leptines in support of the proposal that all who took the census of immunity should be carefully investigated. Great stress is laid on the reputation for ingratitude and breach of faith which the abolition of immunities would bring upon the state. Besides, the law itself had been passed unconstitutionally, for an existing law confirmed these privileges, and by the constitution of Solon no law could be enacted until any existing law which it contravened had been repealed. The law was probably condemned. Nothing further is known of Leptines.

See the edition of the speech by J. E. Sandys (1890).
LEPTIS—

Cinyps; 482 Jug. Punic allegiance Italicum. born the city rendus Ganneau, Leptis 1 cotniti of Phoenician continent. Augustus, xxxiv. centuries (Ammian. to Leptis byzantine, Massinissa (C.I.L. Herodotus Acad., in Punic of the Marc, 106). During the Jugurthine War it appealed for protection to Rome (Sallust, Jug. 78). Though captured and plundered by Juba, it maintained its allegiance to Rome, supported the senatorial cause, received Caesars’ victory and the remains of the Roman forces after Pharsalus 48 B.C. After his victory Julius Caesar imposed upon it an annual contribution of 300,000 measures of oil. Nevertheless, it preserved its position as a free city governed by its own magistrates (C.I.L. vii. 7). It received the title of municipium (C.I.L. viii. 8), and was subsequently made a colonia by Trajan (C.I.L. viii. 10). Septimius Severus, who was born there, beautified the place and conferred upon it the Ius Italicum. Leptis Magna was the limit of the Roman state, the last station of the itineraries Tripolitanus; hence, especially during the last centuries of the Empire, it suffered much from the Nomads of the desert, the Garamantes, the Austurian and the Levathae (Amman. Marc. xxvii. 6; Procop. De Aedif. v. 4). Its commerce declined and its harbour silted up. Justinian made a vain attempt to rebuild it (Procop. ibid.; Ch. Diehl, L’Afrique byzantine, p. 388). It was the seat of a bishopric, but no mention is made of its bishop after 462.

Leptis Magna had a cathedral which protected the commercial city which was generally called Neapolis, the situation of which may be compared with that of Carthage at the foot of Byrsa. Its ruins are still imposing; remains of ramparts and docks, a theatre, a circus and various buildings of the Roman period still exist. Inscriptions show that the current pronunciation of the name was Lepeis, Lepcitania, instead of Leptis, Leptitana (Tissot, Geogr. comp. de la prov. d’Afrique, ii. 219; Clermont-Ganneau, Recueil d’archéologie orientale, vii. 41; Comptes rendus de l’Acad. des Inscr. et B-Lettres, 1903, p. 333; Cagnat, C.R. Acad., 1905, p. 531). The coins of Leptis Magna, like the majority of the emporia in the neighbourhood, present a series from the Punic period. They are of bronze with the legend ὄνομα (Lepō). They have on one side the head of Bacchus, Hercules or Cybele, and on the other various emblems of these deities. From the Roman period we have also coins bearing the heads of Augustus, Livia and Tiberius, which still have the name of the city in the Neo-Punic script (Lud. Müller, Numism. de l’Afr. étrangère, ii. 2).

The ruins of Leptis Magna have been visited by numerous travellers since the time of Frederick William and Henry William Beechey (Travels, pp. 51 and 74) and Heinrich Barth (Wanderungen, pp. 306-307); they are described by Ch. Tissot (Geogr. comp. ii. 210 et seq.); Cl. Perroud, De Systels emporis, p. 33 (Paris, 1881, in 8°); see also a description in the New York journal, The Nation (1877), vol. xxvii. No. 653, M. Meihler de Mathius explored the site afresh in 1901; his account is inserted in the Nouvelles Archeologiques, 1901, pp. 242-245, and 1902, pp. 125-126. See also J. Tournoir, "Le Limes Tripolitanus in Tripolitaine," in the Bulletin archéologique du comité des travaux historiques (1905).

2. Leptis Parva (Lamat), 7½ m. from Monastir, which is often confused by modern writers with Leptis Magna in their interpretation of ancient texts (Tissot, Geogr. comp. ii. 169), was, according to the Tabula Peutingeriana, 18 m. south of Hadrumetum. Evidently Phoenician in origin like Leptis Magna, it was in the Punic period of comparatively slight importance. Nevertheless, it had fortifications, and the French engineer, A. Daux, has discovered a probable line of ramparts. Like its neighbour Hadrumetum, Leptis Parva declared for Rome after the last Punic War. Also after the fall of Carthage in 146 it preserved its autonomy and was declared a civitas libera et immunitas (Appian, Panica, 94; C.I.L. i. 200; De bell. Afric. xii. 2). Julius Caesar made it the base of his operations before the battle of Thapsus in 46 (Ch. Tissot, Geogr. comp. ii. 728). Under the Empire Leptis Parva became extremely prosperous: its bishops appeared in the African councils from 258 onwards. In Justinian’s reorganization of Africa we find that Leptis Parva was with Capsa one of the two residences of the Dux Byzacaeae (Tissot, op. cit. p. 171). The town had coins under Augustus and Tiberius. On the obverse is the imperial effigy with a Latin legend, and on the reverse the Greek legend ΛΕΠΙΤΙΟΝ with the bust of Mercury (Lud. Müller, Numism. de l’Anc. Africa, ii. 49). The ruins extend along the sea-coast to the north-west of Leptis; the remains of docks, the amphitheatre and the acropolis can be distinguished; a Christian cemetery has furnished tombs adorned with curious mosaics.

Cagnat, Explorations archéol. en Tunisie, 3 vols. fasc. pp. 9-16, and 12-16; Cagnat, Mission à Carthage (1896); Mission à Thysdrus (1896); Mission à Tunisie (1896), pp. 9-20; Bulletin archéol. du comité des travaux historiques (1895), pp. 69-71 (inscriptions of Leptis); Bulletin de la Soc. archéol. de Sousse (1905); plan of the ruins of Leptis. (E. B.)

LE PUY, or LE PUY EN VELAY, a town of south-eastern France, capital of the department of Haute-Loire, 90 m. S.W. of Lyons on the Paris-Lyon railway. Pop. (1906) town, 17,201; commune, 21,420. Le Puy rises in the form of an amphitheatre from a height of 2050 ft. above sea-level upon Mont Brion, a hill that divides the left bank of the Dolezon from the right bank of the Borne (a rapid stream joining the Loire 3 m. below). From the new town, which lies east and west in the valley of the Dolezon, the traveller ascends the old feudal and ecclesiastical town through narrow steep streets, paved with pebbles of lava, to the cathedral commanded by the fantastic pinnacle of Mont Corneille. Mont Corneille, which is 433 ft. above the Place de Brueil (in the lower town), is a steep rock of volcanic breccia, surmounted by an iron statue of the Virgin (53 ft. high) cast, after a model by Bonnassieux, out of guns taken at Sebastopol. Another statue, that of Mgr. de Morhon, bishop of Le Puy, also sculptured by Bonnassieux, faces that of the Virgin. From the platform of Mont Corneille a magnificent panoramic view is obtained of the town and of the volcanic mountains, which make this region one of the most interesting parts of France.

The Romanesque cathedral (Notre-Dame), dating chiefly from the first half of the 12th century, has a particularised façade of white sandstone and black volcanic breccia, which is reached by a flight of sixty steps, and consists of three tiers, the lowest composed of three high arcades opening into the porch, which extends beneath the first bays of the nave; above are three windows lighting the nave; and these in turn are surmounted by three gables, two of which are on the right and the left, are of open work. The staircase continues within the porch, where it divides, leading on the left to the cloister, on the right into the church. The doorway of the south transept is sheltered by a fine Romanesque porch. The isolated bell-tower (184 ft.), which rises behind the choir in seven stores, is one of the most beautiful examples of the Romanesque transition period. The bays of the nave are covered in by octagonal cupolas, the central cupola forming a lantern. The choir and transepts are barrel-vaulted. Much veneration is paid to a small image of the Virgin on the high altar, a modern copy of the medieval image destroyed at the Revolution. The cloister, to the north of the choir, is striking, owing to its various-coloured materials and elegant shafts. Violet-le-Duc considered one of its galleries to belong to the oldest known type of cathedral cloister (8th or 9th century). Connected by the cloister are remains of fortifications of the 15th century, by which it was separated from the rest of the city. Near the cathedral the
baptistery of St John (11th century), built on the foundations of a Roman building, is situated by walls and numerous remains of the period, partly uncovered by excavations. The church of St Lawrence (14th century) contains the tomb and statue of Bertrand du Guesclin, whose ashes were afterwards carried to St Denis.

Le Puy possesses fragmentary remains of its old line of fortifications, among them a machicolated tower, which has been restored, and a few curious old houses dating from the 12th to the 17th century. In front of the hospital there is a fine medieval porch under which a street passes. Of the modern monuments the statue of Marie Joseph Paul, marquis of La Fayette, and a fountain in the Place de Breuil, executed in marble, bronze and syenite, may be specially mentioned. The museum, named after Charles Crozatier, a native sculptor and metal-worker to whose munificence it principally owes its existence, contains antiquities, engravings, a collection of lace and ethnographical and natural历史收集. Among the curiosities of Le Puy should be noted the church of St Michel d'Aiguilhe, beside the gate of the town, perched on an isolated rock like Mont Cornelle, the top of which is reached by a staircase of 271 steps. The church dates from the end of the 10th century and its chancel is still older. The steeple is of the same type as that of the cathedral. Three miles from Le Puy are the ruins of the Château de Polignac, one of the most important feudal strongholds of France.

Le Puy is the seat of a bishopric, a prefect and a court of assizes, and has tribunals of first instance and of commerce, a board of trade arbitration, a chamber of commerce, and a branch of the Bank of France. Its educational institutions include ecclesiastical seminaries, lycées and training colleges for both sexes and municipal industrial schools of drawing, architecture and mechanics applied to arts and industries. The principal manufacture is that of lace and gipürine (in woollen, linen, cotton, silk and gold and silver threads), and distilling, leather-dressing, matting and the manufacture of chocolate and cloth are carried on. Cattle, woolens, grain and vegetables are the chief articles of trade.

It is not known whether Le Puy existed previously to the Roman invasion. Towards the end of the 4th or beginning of the 5th century it became the capital of the country of the Vellati, at which period the bishopric, originally at Revessèm, now St Paulien, was transferred thither. Gregory of Tours speaks of it by the name of Anicium, because a chapel ad Deum had been built on the mountain above the town of Mont Aigouilhe or Aiguilhe. In the 10th century it was called Podicum Sanctae Marine, whence Le Puy. In the middle ages there was a double enclosure, one for the cloister, the other for the town. The sanctuary of Nôtre Dame des Tours, which was much frequented by pilgrims, and the city grew famous and populous. Rivalries between the bishops who held directly the see of Rome and had the right of confining money, and the lords of Polignac, revolts of the town against the royal authority, and the encroachments of the feudal jurisdiction, kept its tranquillity and strongholds, but never brought it to its knees. Popes and cardinals often disturbed the quiet of the town. The Saracens in the 8th century, the Bourgeois in the 12th, the English in the 14th, the Burgundians in the 15th, successively ravaged the neighbourhood. Le Puy was of no importance to the Counts of Auvergne until the time of Raymond d'Aiguilhe, called d'Agiles, one of its sons, was their historian. Many councils and various assemblies of the states of Languedoc met within its walls; popes and sovereigns, among the latter Charlemagne and Francis I., visited its sanctuary. Posteriorly the Leaguers, it did not submit to Henry IV. until many years after his accession.

**LERDO DE TEJADA, SEBASTIAN** (1825-1886), president of Mexico, was born at Jalapa on the 25th of April 1825. He was educated as a lawyer and became a member of the supreme court; he became a supporter of President Juarez. He was minister of foreign affairs for three months in 1857, and became president of the Chamber of Deputies in 1861. During the French intervention and the reign of the emperor Maximilian he continued loyal to the patriotic party, and had an active share in conducting the national resistance. He was minister of foreign affairs to President Juarez, and he showed an implacable resolution in carrying out the execution of Maximilian at Queretaro. When Juarez died in 1872 Lerro succeeded him in office in the midst of a confused civil war. He achieved some success in pacifying the country and began the construction of railways. He was re-elected on the 24th of July 1876, but was expelled in January of the following year by Porfirio Diaz. He had made himself unpopular by the means he took to secure his re-election and by his disposition to limit state rights in favour of a strongly centralized government. He fled to the United States and died in obscurity at New York in 1889.

**LÉRIDA**, a province of northern Spain, formed in 1833 of districts previously included in the ancient province of Catalonia, and bounded on the N. by France and Andorra, E. by Gerona and Barcelona, S. by Tarragona and W. by Saragossa and Huesca. Pop. (1900) 274,590; area 4500 sq. m. The northern half of Lérida belongs entirely to the Mediterranean or eastern section of the Pyrenees, and comprises some of the finest scenery in the whole chain, including the valleys of Aran and La Cerdaña, and large tracts of forest. It is watered by many rivers, the largest of which is the Segre, a left-hand tributary of the Ebro. South of the point at which the Segre is joined on the right by the Noguera Pallaresa, the character of the country completely alters. The Llanos of Urgel, which comprise the greater part of southern Lérida, are extensive plains forming part of the Ebro valley, but redeemed by an elaborate system of canals from the sterility which characterizes so much of that region in Aragon. Lérida is traversed by the main railway from Barcelona to Saragossa, and by a line from Tarragona to the city of Lérida. In 1904 the Spanish government agreed with France to carry another line to the mouth of an international tunnel through the Pyrenees. Industries are in a more backward condition than in any other province of Catalonia, despite the abundance of water-power. There are, however, many saw-mills, flour-mills, and distilleries of alcohol and liqueurs, besides a smaller number of cotton and linen factories, paper-mills, soap-works, and oil and leather factories. Zinc, lignite and common salt are mined, but the output is small and of slight value. There is a thriving trade in wine, olive oil, wool, woolen goods, mules, horses, cattle, and sheep, but the general agricultural is far less prosperous than in the maritime provinces of Catalonia. Lérida (pop. 840,000) is the capital (pop. 21,432), and the only town with more than 5000 inhabitants. Só de Urgel, near the headwaters of the Segre, is a fortified city which has been an episcopal see since 840, and has had a close historical connexion with Andorra (q.v.). Solsona, on a small tributary of the Cardoner, which flows through Barcelona to the Mediterranean, is the *Setelis* of the Romans, and contains in its parish church an image of the Virgin said to possess miraculous powers, and visited every year by many hundreds of pilgrims. Cervera, on a small river of the same name, contains the buildings of a university which Philip V. established here in 1717. This university had originally been founded at Barcelona in the 15th century, and was reopened there in 1842. In character, and especially in their industry, intelligence and local patriotism, the inhabitants of Lérida are typical Catalans. (See *Catalonia*.)

**LÉRIDA**, the capital of the Spanish province of Lérida, on the river Segre and the Barcelona-Saragossa and Lérida-Tarragona railways. Pop. (1900) 21,432. The older parts of the city, on the right bank of the river, are a maze of narrow and crooked streets, surrounded by ruined walls and a moat, and commanded by the ancient citadel, which stands on a height overlooking the plains of Noguera on the north and of Urgel on the south. On the left bank, connected with the older quarters by a fine
stone bridge and an iron railway bridge, are the suburbs, laid out after 1880 in broad and regular avenues of modern houses. The old cathedral, last used for public worship in 1707, is a very interesting late Romanesque building, with Gothic and Maurelquesque additions; but the interior was much defaced by its conversion into barracks after 1717. It was founded in 1293 by Pedro II. of Aragon, and consecrated in 1278. The fine octagonal belfry was built early in the 13th century. A second cathedral, with a Corinthian façade, was completed in 1781. The church of San Lorenzo (1270-1300) is noteworthy for the beautiful tracery of its Gothic windows; its nave is said to have been a Roman temple, converted by the Moors into a mosque and by Ramon Berenguer IV., last count of Barcelona, into a church. Other interesting buildings are the Romanesque town hall, founded in the 13th century but several times restored, the bishop’s palace and the military hospital, formerly a convent. The museum contains a good collection of Roman and Romanesque antiquities; and there are a school for teachers, a theological seminary and academies of literature and science. Leather, paper, glass, silk, linen and cloth are manufactured in the city, which has also some trade in agricultural produce.

Lérida is the Tiera of the Romans, and was the capital of the people whom they called Iberenses (Fliny) or Ilergetes (Ptolomy). By situation the key of Catalonia and Aragon, it was from a very early period an important military station. In the Punic Wars it sided with the Carthaginians and suffered much from the Roman arms. In its immediate neighbourhood Hanno was defeated by Scipio in 216 B.C., and it afterwards became famous as the scene of Caesar’s arduous struggle with Pompey’s generals Afranius and Petreius in the first year of the civil war (49 B.C.). It was already a municipium in the time of Augustus, and enjoyed great prosperity under later emperors. Under the Visigoths it became an episcopal see, and at least one ecclesiastical council is recorded to have met here (in 546). Under the Moors Laredo became one of the principal cities of the province of Saragossa; it became tributary to the Franks in 703, but was reconquered in 707. In 1140 it fell into the hands of Ramon Berenguer IV. In modern times it has come through numerous sieges, having been taken by the French in November 1717 during the War of Succession, and again in 1810. In 1300 James II. of Aragon founded a university at Lérida, which achieved some repute in its day, but was suppressed in 1717, when the university of Cervera was founded.

LERMA—LERMONTOV

Lerma, Francisco de Sandoval y Rojas, Duke of (1552-1625), Spanish minister, was born in 1552. At the age of thirteen he entered the royal palace as a page. The family of Sandoval was ancient and powerful, but under Philip II. (1556-1598) the nobles, with the exception of a few who held vicerealties or commanded armies abroad, had little share in the government. The future duke of Lerma, who was by descent marquis of Denia, passed his life as a courtier, and possessed no political power till the accession of Philip III. in 1598. He had already made himself a favourite with the prince, and was in fact one of the incapable men who, as the dying king Philip II. foresaw, were likely to mislead the new sovereign. The old king’s fears were fully justified. No sooner was Philip III. king than he entrusted all authority to his favourite, whom he created duke of Lerma, by which title he was afterwards enabled to lavish an immense list of offices and grants. The favour of Lerma lasted for twenty years till it was destroyed by a palace intrigue carried out by his own son. Philip III. not only entrusted the entire direction of his government to Lerma, but authorized him to affix the royal signature to documents, and to take whatever presents were made to him. No royal favourite was ever more amply trusted, or made a worse use of power. At a time when the state was practically bankrupt, he encouraged the king in extravagance, and accumulated for himself a fortune estimated by contemporaries at forty-four millions of ducats. Lerma was pious withal, spending largely on religious houses, and he carried out the ruinous measures for the expulsion of the Moriscos in 1610—a policy which secured him the admiration of the clergy and was popular with the mass of the nation. He persisted in costly and useless hostilities with England till, in 1604, Spain was forced by exhaustion to make peace, and he used all his influence against a recognition of the independence of the Low Countries. The fleet was neglected, and the State was reduced to bankruptcy; and the finances ruined beyond recovery. His only resources as a finance minister were the debasing of the coinage, and foolish edicts against luxury and the making of silver plate. Yet it is probable that he would never have lost the confidence of Philip III., who divided his life between festivals and prayers, but for the domestic treachery of his son, the duke of Uceda, who combined with the king’s confessor, Aligia, whom Lerma had introduced to the place, to turn him out. After a long intrigue in which the king was all but entirely dumb and passive, Lerma was at last compelled to leave the court, on the 4th of October 1618. As a protection, and as a means of retaining some measure of power in case he fell from favour, he had persuaded Pope Paul V. to create him cardinal, in the year of his fall. He retired to the town of Lerma in Old Castle, where he had built himself a splendid palace, and then to Valladolid. Under the reign of Philip IV., which began in 1621 he was despoiled of part of his wealth, and died in 1625.

The history of Lerma’s tenure of office is in vol. xv. of the Historia General de España of Modesto Lafuente (Madrid, 1855)—with references to contemporary authorities.

Lermontov, Mikhail Yurevich (1814-1841), Russian poet and novelist, often styled the poet of the Caucasus, was born in Moscow, of Scottish descent, but belonged to a respectable family of the Tula government, and was brought up in the village of Tarkhami (in the Penzensk government), which now preserves his birthplace. By his paternal grandmother—on whom the whole care of his childhood was devolved by his mother’s early death and his father’s military service—no cost nor pains was spared to give him the best education she could think of. The intellectual atmosphere which he breathed in his youth differed little from that in which Pushkin had grown up, though the domination of French had begun to give way before the fancy for English, and Lamartine shared his popularity with Byron. From the academic gymnasium in Moscow Lermontov passed in 1830 to the university, but there his career came to an untimely close through the part he took in some acts of insubordination to an obnoxious teacher. From 1830 to 1834 he attended the school of cadets at St Petersburg, and in due course he became an officer in the guards. To his own and the nation’s anger at the loss of Pushkin (1837) the young soldier gave vent in a passionate poem addressed to the tsar, and the very voice which proclaimed that, if Russia took it into her vengeance on the assassin of her poet, no second poet would be left her. There is an indication that a poet had come already. The tsar, however, seems to have given no importance than inspiration in the address, for Lermontov was forthwith sent off to the Caucasus as an officer of dragoons. He had been in the Caucasus with his grandmother as a boy of ten, and he found himself at home by yet deeper sympathies than those of childish recollection. The stern and rocky virtues of the mountaineers against whom he had to fight, no less than the scenery of the rocks and mountains themselves, proved akin to his heart; the emperor had exiled him to his native land. He was in St Petersburg in 1838 and 1839, and in the latter year wrote the novel, A Hero of Our Time, which is said to have been the occasion of the duel in which he lost his life in July 1841. In this contest he had purposely selected the edge of a precipice, so that if either combatant was wounded so as to fall his fate should be sealed.

Lermontov published only one small collection of poems in 1840. The work was, much mutilated by the censorship, was issued in 1842 by Glazounov; and there have been full editions of his works in 1860 and 1863. To Bodenstein’s German translation of his poems (Mikhail Lermontov’s poetischer Nachlass, Berlin, 1842, 2 vols.) which indeed was the first satisfactory collection, he is indebted for a wide reputation outside of Russia. His novel was found several translators (August Boltz, Berlin, 1852, &c.). Among his best-known pieces are “Ismail-Bey,” “Hadji Abrek,” “Walerik,” “The Novice,” and, remarkable as an imitation of the old Russian ballad “The song of the tsar Ivan Vasilvitch, his young bodyguard, and the bold merchant Kalashnikov.”

(February 1855), reprinted in Allemagne et Russie (Paris, 1856); Dudushkin's "Materials for the Biography of Lermontov," prefixed to the 1863 edition of his works, The Demon, translated by Sir Alexander Condie Stephen (1875), is an English version of one of his longer poems.

LE ROUX, PIERRE (1798–1871), French philosopher and economist, was born at Bercy near Paris on the 7th of April 1818, the son of an artisan. His education was interrupted by the death of his father, which compelled him to support his mother and family. Having worked first as a mason and then as a compositor, he joined P. Dubois in the foundation of Le Globe which became in 1831 the official organ of the Saint-Simonian community, of which he became a prominent member. In November of the same year, when Enfantin preached the emancipation of women and the functions of the couple-prêtre, Leroux separated himself from the sect. In 1838, with J. Regnaud, who had succeeded with him, he founded the Encyclopédie nouvelle (eds. 1838–41). Amongst the articles which he inserted in it were De l'égalité et Réjection de l'éclatisme, which afterwards appeared as separate works. In 1840 he published his treatise De l'humanité (2nd ed, 1841), which contains the fullest exposition of his system, and was regarded as the philosophical manifesto of the Humanitarians. In 1841 he established the Revue indépendante, with the aid of George Sand, over whom he had great influence. Her Spiridons, which was dedicated to him, Sept cordes de la lyre, Consulde, and La Comtesse de Rudolstadt, were written under the Humanitarian inspiration. In 1842 he established at Boussac (Creuse) a printing association organized according to his systematic ideas, and founded the Revue sociale. After the outbreak of the revolution of 1848 he was elected to the Constituent Assembly, and in 1840 to the Legislative Assembly, but his speeches on behalf of the extreme socialist wing of so abstract and mystical a character that they had no effect. After the coup d'état of 1851 he settled with his family in Jersey, where he pursued agricultural experiments and wrote his socialist poem La Grèce de Samara. On the definitive amnesty of 1869 he returned to Paris, where he died in April 1871, during the Commune.

The writings of Leroux have no permanent significance in the history of thought. He was the propagandist of sentiments and aspirations rather than the expounder of a systematic theory. He has, indeed, a system, but it is a singular medley of doctrines borrowed from Saint-Simon, Saint-Simonism, and Buddhistism. In philosophy his fundamental principle is that of what he calls the "triad"—a trinity which he finds to pervade all things, which in God is "power, intelligence and love," in man "sentiment, sentiment and knowledge." His religious doctrine is Pantheistic; and rejecting the belief in a future life commonly received, he substitutes for it a theory of metempsychosis. In social economy his views are very vague; he preserves the family, country and property, but finds in all three, as they now are, a despotism which must be eliminated. He imagines certain combinations by which this triple tyranny can be abolished, but his solution seems to require the creation of families without heads, countries without governments and property without rights of possession. In politics he advocates absolute equality—a democracy pushed to anarchy.

LE ROY-BAULIEU, HENRI JEAN BAPTISTE ANATOLE (1842-1898), French publicist, was born at Lisieux, on the 12th of February 1842. In 1866 he published Une troisière de comédies, and afterwards Essai sur la restauration de nos monuments historiques devant l'art et devant le budget, which deals particularly with the restoration of the cathedral of Evreux. He visited Russia in order to collect documents on the political and economic organization of the Slav nations, and on his return published in the Revue des deux mondes (1882–1886) a series of articles, which appeared shortly afterwards in book form under the title L'Empire des Russes (4th ed., revised in 3 vols., 1887–1893). The work entitled Un empereur, un roi, un peuple, une restauration, published in 1879, was an analysis and criticism of the politics of the Second Empire. Un homme d'état russe (1884) gave the history of the emancipation of the serfs by Alexander II.

Other works are Les Catholiques libéraux, l'église et le libéralisme (1880), La Papauté, le socialisme et la démocratie (1882), Les Juifs et l'autisme (1883), Les Arméniens et la question arménienne (1886), L'Autisme (1897), Études russes et européennes (1897). These writings, mainly collections of articles and lectures intended for the general public, display enlightened views and wide information. In 1881 Leroy-Beaulieu was elected professor of contemporary history and eastern affairs at the École Libre des Sciences Politiques, becoming director of this institution on the death of Albert Sorel in 1896, and in 1887 he became a member of the Académie des Sciences Morales et Politiques.

Two of Leroy-Beaulieu's works have been translated into English: one, Les études de Pierre Leroy-Beaulieu, by L. A. Regozin (New York, 1883–1896), and another as Papacy, Socialism, Democracy, by B. L. O'Donnell (1892). See W. E. H. Lecky, Historical and Political Essays (1908).

LE ROY-BAULIEU, PIERRE PAUL (1843-1909), French economist, brother of the preceding, was born at Saumur on the 9th of December 1843, and educated in Paris at the Lycée Bonaparte and the Ecole de Droit. He afterwards studied at Bonn and Berlin, and on his return to Paris began to write for Le Temps, Revue nationale and Revue contemporaine. In 1867 he won a prize offered by the Academy of Moral Science with an essay entitled "L'Influence de l'état moral et intellecutuel des populations ouvrières sur le taux des salaires." In 1870 he gained three prizes for essays on "La Colonization chez les peuples modernes," "L'Administration en France et en Angleterre," and "L'Empôt foncier et ses conséquences économiques."

In 1872 Leroy-Beaulieu became professor of finance at the newly-founded École Libre des Sciences Politiques, and in 1880 he succeeded his father-in-law, Michel Chevalier, in the chair of political economy in the Collège de France. Several of his works have made their mark beyond the borders of his own country. Among these may be mentioned his Recherches économiques, historiques et statistiques sur les guerres contemporaines, a series of studies published between 1863 and 1896, in which he calculated the loss of men and capital caused by the great European conflicts. Other works by him are—La Question monnaiue au dix-neuvième siècle (1861), Le Travail des femmes au dix-neuvième siècle (1873), Traité de la science des finances (1877), Essai sur la répartition des richesses (1882), L'Algérie et la Tunisie (1888), Précis d'économie politique (1888), and L'État moderne et ses fonctions (1888). He also founded in 1873 the Économiste français, on the model of the English Economist. Leroy-Beaulieu may be regarded as the leading representative in France of orthodox political economy, and the most pronounced opponent of protectionist and collectivist doctrines.

LERWICK, a municipal and police burgh of Shetland, Scotland, the most northerly town in the British Isles. Pop. (1901) 1,461. It is situated on Brassy Sound, a fine natural harbour, on the east coast of the island called Mainland, 115 m. N.E. of Kirkwall, in Orkney, and 310 m. from Leith by steamer. The town dates from the beginning of the 17th century, and the older part consists of a flagged causeway called Commercial Street, running for 1 m., parallel with the town quay, and giving access (from the quay) to several of the quaint-looking houses stand), and so narrow in places as not to allow of two vehicles passing each other. At right angles to this street lanes ascend the hill-side to Hillhead, where the more modern structures and villas have been built. At the north end stands Fort Charlotte, erected by Cromwell, repaired in 1665 by Charles II. and altered in 1781 by George III., after whose queen it was named. It is now used as a depôt for the Naval Reserve, for whom a large drill hall was added. The Anderson Institute, at the south end, was constructed as a secondary school in 1862 by Arthur Anderson, a native, who also presented the Widows' Asylum in the same quarter, an institution intended by preference for widows of Shetland sailors. The town hall, built in 1881, contains several stained-glass windows, two of which were the gift of citizens of Amsterdam and Hamburg, in gratitude for services rendered by the islanders to fishermen and seamen of those parts. Lerwick's main industries are connected with the fisheries, of which it is an
important centre. Docks, wharves, piers, curving stations and warehouses have been provided or enlarged to cope with the growth of the trade, and an esplanade has been constructed along the front. The town is also the chief distributing agency for the islands, and carries on some business in knitted woollen goods. One mile west of Lerwick is Clickimin Loch, separated from the sea by a narrow strip of land. On an islet in the lake stands a ruined "broch" or round tower.

LE SAGE, ALAIN RENÉ (1668-1747), French novelist and dramatist, was born at Sarzeau in the peninsula of Rhuys, between the Morbihan and the sea, on the 13th of December 1668. Rhuys was a legal district, and Claude Le Sage, the father of the novelist, held the united positions of advocate, notary and registrar. The legal career pursued by Jeanne, the writer's mother, was altered by his death, and his property was wasted and embezzled by his guardians. Little is known of his youth except that he went to school with the Jesuits at Vannes until he was eighteen. Conjecture has it that he continued his studies at Paris, and it is certain that he was called to the bar at the capital in 1692. In August 1694 he married the daughter of a joiner, Marie Elizabeth Huyard. She was beautiful but had no fortune, and Le Sage had little practice. About this time he met his old schoolfellow, the dramatist Danchet, and is said to have been advised by him to betake himself to literature. He began modestly as a translator, and published in 1695 a French version of the Epistles of Aristaenus, which was not successful. Shortly afterwards he translated the plays of Calderon, and went to Paris in the abè de Lyonne, who bestowed on him an annuity of 600 livres, and recommended him to exchange the classics for Spanish literature, of which he was himself a student and collector.

Le Sage began by translating plays chiefly from Rojas and Lope de Vega. Le Traité puni and Le Point d'honneur from the former, Don Félix de Mendoc from the latter, were acted or published in the first two or three years of the 18th century. In 1704 he translated the continuation of Don Quijote by Avellaneda, and soon afterwards adapted a play from Calderon, Don César Ursin, which had a divided fate, being successful at court and damned in the city. He was, however, nearly forty before he obtained anything like decided success. But in 1707 his admirable farce of Crispin rival de son maître was acted with great success. Diable boiteux. This latter went through several editions in the same year, and was frequently reprinted till 1725, when Le Sage altered and improved it considerably, giving it its present form. Notwithstanding the success of Crispin, the actors did not like Le Sage, and refused a small piece of his called Les Étrennes (1707). He thereupon altered it into Turcaret, his theatrical masterpiece, and one of the best comedies in French literature. This appeared in 1709. Some years passed before he again attempted romance writing, and then the first two parts of Gil Bias de Santillano appeared in 1715. Strange to say, it was not so popular as Le Diable boiteux. Le Sage worked at it for a long time, and did not bring out the third part till 1724, nor the fourth till 1735. For a greater part of his life he passed as the author of these two parts of which he had the brain and nervous control. He thus poked and piloted them some years before its appearance. During these twenty years he was, however, continually busy. Notwithstanding the great merit and success of Turcaret and Crispin, the Théâtre Français did not welcome him, and in the year of the publication of Gil Bias he began to write for the Théâtre de la Foire—the comic opera held in booths at festival time. This, though not a very dignified occupation, was followed by many writers of distinction at this date, and by none more assiduously than by Le Sage. According to one computation he produced, either alone or with others, about a hundred pieces, varying from strings of songs with no regular dialogues, to comediettas only distinguished from regular plays by the introduction of music. He was also industrious in prose fiction. Besides finishing Gil Bias, he translated the Orlando innamorato (1721), rearranged Guzmán d'Alfarache (1732), published two more or less original novels, Le Batcheur de Salamanque and Estébanille Gonsales, and in 1733 produced the Vie et aventure de M. de Beauchene, which is curiously like certain works of Defoe. Besides all this, Le Sage was also the author of La Valise trouvée, a collection of imaginary letters, and of some minor pieces, of which Une journée des parques is the most remarkable. This laborious life he continued until 1740, when he was more than seventy years of age. His eldest son had become an actor, and Le Sage had disowned him, but the second was a canon at Boulogne in comfortable circumstances. In the year just mentioned his father and mother went to live with him. At Boulogne Le Sage spent the last seven years of his life, dying on the 17th of November 1747. His last work, Mélange amusant de saillies d'esprit et de traits historiques les plus frappants, had appeared in 1743.

Not much is known of Le Sage's life and personality, and there are few authentic facts about his life more important but almost the only facts available for it. The few anecdotes which we have of him represent him as a man of very independent temper, declining to accept the condescending patronage which in the earlier part of the century was still the portion of men of letters. Thus it is said that, on being remonstrated with, as he thought impolitely, for an unavoidable delay in appearing at the duchess of Bouillon's house to read Turcaret, he at once put the play in his pocket and retired, refusing absolutely to return. It may, however, be said that as in time so in position he occupies a place apart from most of the great writers of the 17th and 18th centuries respectively. He was not the object of royal patronage like the first, nor the pet of salons and coteries like the second. Indeed, he seems all his life to have been purely domestic in his home and local relations. Le Sage's style is frequently compared with that of his countryman, Manon, but he is very different from her, and has been called in some respects more akin to the Italian happier wit of Ariosto and Castiglione. Le Sage's style is also compared with that of the German and Dutch novelists. But all these comparisons are unjust. Le Sage did not merely translate, or make light and pretty stories, but he added his own. His subjects are more serious, and his thoughts are profound. He seems to be of a nature more capable of serious reflection than of good humour, and his works are more serious than comic. This peculiarity of his is visible in his criticism of Molière, who, in the opinion of Le Sage, was neither a poet nor a wit.

The importance of Le Sage in French and in European literature is not entirely the same, and he has the rare distinction of being more important in the latter than in the former. His literary work may be divided into three parts. The first contains his Théâtre de la Foire and his few miscellaneous writings, the second his two remarkable plays Crispin and Turcaret, the third his prose fictions. In the first two he swims within the general literary current in France; he can be and must be compared with others of his own nation. But in the third he emerges altogether from merely national comparison. It is not with Frenchmen that he is to be measured. He formed no school in France; he followed no French models. His work, admirable as it is from the mere point of view of style and form, is a parenthesis in the general development of the French novel. That product works its way from Madame de la Fayette through Marivaux and Prévost, not through Le Sage. His literary ancestors are Spaniards, his literary contemporaries and successors are Englishmen. The position is almost unique; it is certainly interesting and remarkable in the highest degree.

Of Le Sage's miscellaneous work, including his numerous farce-operettas, there is not much to be said except that they are the very best kind of literary hack-work. The pure and original style of the author, his abundant wit, his cool, humoristic attitude towards human life, which wanted only greater earnestness and a wider conception of that life to turn it into true humour, are discernible throughout. But this portion of his work is typically French, and the comic spirit is predominant only on the critic. Crispin and Turcaret show a stronger and more deeply marked genius, which, but for the ill-will of the actors, might have gone far in this direction. But Le Sage's peculiar unwillingness to attempt anything absolutely new discovered itself here. Even when he had devoted himself to the Foire theatre, it seems that he was unwilling to attempt, when occasion called for it, the absolute innovation of a piece with only one actor, a crux which Alexis Piron, a lesser but a bolder genius, accepted and carried through. Crispin and Turcaret are unquestionably Molièresque, though they are perhaps more original in their following of Molière than any other plays that can be named. For this also was part of Le Sage's idiosyncrasy that, while he was apparently unable or unwilling to strike out an entirely new line for himself, he had no sooner entered upon the beaten path than he left it to follow his own devices. Crispin rival de son maître is a farce in one act and many scenes, after the earlier manner of motion. Its
plot is somewhat extravagant, inasmuch as it lies in the effort of a knavish valet, not as usual to further his master's interests, but to supplant that master in love and gain. But the charm of the piece consists first in the lively bustling action of the short scenes which take each other up so promptly and smartly that the spectator has not time to dwell at the improbability of the action, and secondly in the abundant wit of the dialogue. Turcaret is a far more important piece of work and ranks high among comedies dealing with the actual society of their time. The only thing which prevents it from holding the very highest place is a certain want of unity in the plot. This want, however, is compensated in Turcaret by the most masterly profusion of character-drawing in the separate parts. Turcaret, the ruthless, dishonest and disolute financier, his vulgar wife as dissolute as himself, the hare-brained marquis, the knavish chevalier, the baroness (a coquette with the finer edge taken off her fineness, yet by no means unlovable), are each and all finished portraits of the best comic type, while most as much as can be said of the minor characters. The style and dialogue are also worthy of the highest praise; the wit never degenerates into mere "wit-combats."

It is, however, as a novelist that the world has agreed to remember Le Sage. A great deal of unnecessary labour has been spent on the discussion of his claims to originality. What has been already said will give a sufficient clue through this thorny ground. In mere form Le Sage is not original. He does little more than adopt that of the Spanish picaroon romance of the 16th and 17th century. Often, too, he prefers merely to rearrange and adapt existing work, and still oftener to give himself a kind of start by adopting the work of a preceding writer as a basis. But it may be laid down as a positive truth that he never, in any work that pretends to originality at all, is guilty of anything that can fairly be called plagiarism. Indeed we may go further, and say that he is very fond of asserting or suggesting his indebtedness when he is really dealing with his own funds. Thus the Diable boiteux borrows the title, and for a chapter or two the plan and almost the words, of the Diablo Cojuelo of Luis Velez de Guevara. But after a few pages Le Sage leaves his predecessor alone. Even the plan of the Spanish original is entirely discarded, and the incidents, the episodes, the style, are as independent as if such a book as the Diablo Cojuelo had never existed. The case of Gil Blas is still more remarkable. It was at first alleged that Le Sage had borrowed it from the Marcos de Obregon of Vincent Espinel, a curiously rash assertion, inasmuch as that work exists and is easily accessible, and as the slightest consultation of it proves that, though it furnished Le Sage with separate incidents and hints for more than a third of his book, Gil Blas as a whole is not in the least indebted to it. Afterwards Father Isla asserted that Gil Blas was a mere translation from an actual Spanish book—an assertion at once incapable of proof and disproved, inasmuch as there is no trace whatever of any such book. A third hypothesis is that there was some manuscript original which Le Sage may have worked up in his usual way, in the same way, for instance, as he professes himself to have worked up the Bachelor of Salamanca. This also is in the nature of it incapable of refutation, though the argument from the Bachelor is strong against it, for there could be no reason why Le Sage should be more reticent of his obligations in the one case than in the other. Except, however, for historical reasons, the controversy is one which may be safely neglected, nor is there very much importance in the more impartial indication of sources—chiefly works on the history of Olivarès—which has sometimes been attempted. That Le Sage knew Spanish literature well is of course obvious, but this is as little doubt (with the limitations already laid down of his real originality as of that of any great writer in the world.) Gil Blas then remains his property, and it is admittedly the capital example of its own style. For Le Sage has not only the characteristic, which Homer and Shakespeare have, of absolute truth to human nature as distinguished from truth to this or that national character, but he has what has been called the quality of detachment, which they also have. He never takes sides with his characters as Fielding (whose master, with Cervantes, he certainly was) sometimes does. Asmodeus and Don Cleofas, Gil Blas and the Archbishop and Doctor Sangrado, are produced by him with exactly the same impartiality of attitude. Except that he brought into novel writing this highest quality of artistic truth, it perhaps cannot be said that he did much to advance prose fiction in itself. He invented, as has been said, no new genre; he did not, as Marivaux and Prévost did, help on the novel as it is said to have been distinguished from the romance. In form his books are undistinguishable, nor merely from the Spanish romances which are, as has been said, their direct originals, but from the medieval romans d'aventures and the Greek prose romances. But in individual excellence they have few rivals. Nor should it be forgotten, as it sometimes is, that Le Sage was a great master of French style, the greatest unquestionably between the classics of the 17th century and the class of the 18th. He is perhaps the last great writer before the decadence (for since the time of Paul Louis Courier it has not been denied that the philosophe period is in point of style a period of decadence). His style is perfectly easy at the same time that it is often admirably epigrammatic. It has plenty of colour, plenty of flexibility, and may be said to be exceptionally well fitted for general literary work.

The dates of the original editions of Le Sage's most important works have already been given. He published during his life a collection of his regular dramatic works, and also one of his pieces other than drama, but there is no evidence that they were issued in any edition which can be called so, though the Oeuvres choisies of 1782 and 1818 are useful, and there are so-called Oeuvres complètes of 1821 and 1830. Besides critical articles by the chief literary critics of the day, Étienne Canivet, Pierre Talairan, L'abbé de Saint-Martin, Charles Garnier, and many others, in four volumes of Garnier's Bibliothèque amusante (Paris, 1865). Turcaret and Crispin are to be found in all collected editions of the French drama. There is a useful edition of them, with ample specimens of Le Sage's work for the Poire, in two volumes (Paris, 1821).

LES ANDELYS—LES BAUX

LES ANDELYS, a town of northern France, capital of an arrondissement in the department of Eure about 30 m. S.E. of Rouen by rail. Pop. (1906) 3955. Les Andelys is formed by the union of Le Grand Andely and Le Petit Andely, the latter situated on the right bank of the Seine, the former about half a mile from the river. Grand Andely, founded, according to tradition, in the 6th century, has a church (13th, 14th and 15th centuries) parts of which are of fine late Gothic and Renaissance architecture. The works of art in the interior include beautiful stained glass of the latter period. Other interesting buildings are the hôtel du Grand Cerf dating from the first half of the 16th century, and the chapel of Sainte-Clotilde, close by a spring which, owing to its supposed healing powers, is the object of a pilgrimage. Grand Andely has a fine view of the town and of the place. Petit Andely sprang up at the foot of the eminence on which stands the château Gaillard, now in ruins, but formerly one of the strongest fortresses in France (see FORTIFICATION AND SIEGECRAFT AND CASTLE). It was built by Richard Cœur de Lion at the end of the 12th century to protect the Norman frontier, was captured by the French in 1204 and passed finally into their possession in 1440. The church of St. Sauveur at Petit Andely also dates from the end of the 12th century. Les Andelys is the seat of a sub-prefect and of a tribunal of first instance, has a preparatory infantry school; it carries on silk milling; and the manufacture of leather, organs and sugar. It has trade in cattle, grain, flour, &c.

LES BAUX, a village of south-eastern France, in the department of Bouches-du-Rhône, 11 m. N.E. of Arles by road. Pop. (1906) 1000. Les Baux, which in the middle ages was a flourishing town, is now almost deserted. Among the few inhabited dwellings, it consists of an assemblage of ruined towers, fallen walls and other débris, which cover the slope of a hill crowned by the remains of a huge château, once the seat of a celebrated "court of love." The ramparts, a medieval church, the château, parts of which date to the 11th century, and many of the dwellings are,
in great hollow, hewn out of the white friable limestone on which they stand. Here and there may be found houses preserving carved façades of Renaissance workmanship. Les Baux has given its name to the reddish rock (bauxite) which is plentiful in the neighbourhood and from which aluminium is obtained. In the middle ages Les Baux was the seat of a powerful family which owned the Terre Bauxsennes, extensive domains in Provence and Dauphiné. The influence of the seigneurs de Baux in Provence declined before the power of the house of Anjou, to which they abandoned many of their possessions. In 1632 the château and the ramparts were dismantled.

LESBONAX, of Mytilène, Greek sophist and rhetorician, flourished in the time of Augustus. According to Ptolemy (Cod. 74) he was the author of sixteen political speeches, of which two are extant, a hortatory speech after the style of Thucydidès, and a speech on the Corinthian War. In the first he exhorts the Athenians against the Spartans, in the second (the title of which is misleading) against the Thébans (edition by F. Kiech, Lesbonacis quaes supersunti, Leipzig, 1907). Some erotic letters are also attributed to him.

The Lesbonas described in Suidas as the author of a large number of philosophical works is probably of much earlier date; on the other hand, the author of a small treatise Πείρα Σωματικον on grammatical figures (ed. Rudolf Müller, Leipzig, 1900) is probably later.

LESBOS (Mytilên, Turk. Midûlû), an island in the Aegean sea, off the coast of Mysia, N. of the entrance of the Gulf of Smyrna, forming the main part of a sanjak in the archipelago of European Turkey. It is divided into three districts, Mytilène or Kastro in the E., Melivo in the N., and Calloni in the W. Since the middle ages it has been known as Mytilén, from the name of its principal town. Strabo estimated the circumference of the island at 1100 stadia, or about 138 m., and Scylax reckoned it seventh in size of the islands of the Mediterranean. The width of the channel between it and the mainland varies from 7 to 10 m. The island is roughly triangular in shape; the three towns are joined by causeways on N. (Sithoû), the W. and the E. (Malá) on the S.E. The Eupiros Pyrrhæus (Calloni) is a deep gulf on the west between Sígrium and Malá. The country though mountainous is very fertile, Lesbos being celebrated in ancient times for its wine, oil and grain. Homer refers to its wealth. Its chief produce now is olives, which also form its principal export. Soap, skins and valona are also exported, and mules and cattle are extensively bred. The sardine fishery is an important trade, and antimony, marble and coal are found on the island. The surface is rugged and mountainous, the highest point, Mount Olympus (Hagios Elias) being 3080 ft. The island has suffered from periodical earthquakes. The roads were remade in 1830, and there is telegraphic communication on the island, and to the mainland by cable. The ports are Sígria and Mytilène. The Gulf of Calloni and Hiera or Olivieri can only be entered by vessels of small draught.

The chief town, called Mytilène, is built in amphitheatre shape round a small bay, crowned by remains of an ancient fortress. There are now 14 mosques and 7 churches, including a cathedral. It was originally built on an island close to the eastern coast of Lesbos, and afterwards when the town became too large for the island, it was joined to Lesbos by a causeway, and the city spread along the coast. There was a harbour on each side of the small island. Malacós, by some surmised to be the northern of these, was not far away. Besides the five cities which gave the island the name of Pentapolis (Mytilène, Methymna, Antissa, Eresus, Pyrrha), there was a town called Arisha, destroyed by an earthquake in the time of Herodotus. Professor Conze thinks that this is the site now called Palaikastro, N.E. of Calloni. Pyrrha lay S.E. of Calloni, and is now also called Palaikastro. Antissa was on the N. coast near Sígria. It was destroyed by the Romans in 168 b.c. Eresus was also near Sígri on the S. coast. Methymna was on the N. coast, on the site of Melivo, still the second city in importance and commerce. The name Methymna is derived from the wine (Gr. μέθυ) for which it was famous. Considerable remains of town walls and other buildings are to be seen on all these sites.

(E. Gr.)

History.—Although the position of Lesbos near the old-established trade-route to the Hellespont marks it out as an important site even in pre-historic days, no evidence on the early condition of the island is as yet obtainable, beyond the Greek tradition which represented it at the time of the Trojan War as inhabited by an original stock of Pelasgi and an immigrant population of Ionians. In historic times it was peopled by an "Aeolian" race who reckoned Boeotia as their motherland and claimed to have migrated about 1050 b.c.; its principal nobles traced their pedigree to Orestes, son of Agamemnon. Lesbos was the most prominent of Aeolian settlements, and indeed played a large part in the early development of Greek life. Its commercial activity is attested by several colonies in Thrace and the Troad, and by the participation of its traders in the settlement of Naucratis in Egypt; hence also the town of Mytiléné, by virtue of its good harbour, became the political capital of the island. The climax of its prosperity was reached about 600 B.C., when a client named Pittacus was appointed as symnhec (dictator) to adjust the balance between the governing nobility and the insurgent commons and by his wise administration and legislation won a place among the Seven Sages of Greece. These years also constitute the golden age of Lesbian culture. The lyric poetry of Greece, which owed much to two Lesbians of the 7th century, the musician Terpander and the dithyrambist Arion, attains the standard of classical excellence under Pittacus' contemporaries Alcaeus and Sappho. In the 6th century the importance of the island declined, partly through a protracted and unsuccessful struggle with Athens for the possession of Sigeum near the Hellespont, partly through a crushing naval defeat inflicted by Polykrates of Samos (about 550). The Lesbians readily submitted to Persia after the fall of Creso of Lydia, and although hatred of their tyrant Coès, a Persian protégé, drove them to take part in the Ionian revolt (499-493), they made little use of their large navy and displayed poor spirit at the decisive battle of Lade. In the 5th century Lesbos, with a population of 70,000, was a member of the Delian League (q.v.), with full rights of self-administration, and under the sole obligation of assisting Athens with naval contingents. Nevertheless at the beginning of the Peloponnesian War the ruling oligarchy of Mytilénè forced on a revolt, which was ended after a two years' siege of that town (429-427). The Athenians, who had intended to punish the rebels by a wholesale execution, contented themselves with killing the ringleaders, confiscating the land and establishing a garrison. In the later years of the war Lesbos was repeatedly attacked by the Peloponnesians, and in 405 the harbour of Mytilène was the scene of a battle between the admirals Callicrátidas and Conon. In 389 most of the island was recovered for the Athenians by Thrasylalus; in 377 it joined the Second Delian League, and maintained throughout a loyal member, although in the second half of the century the dominant democracy was for a while supplanted by a tyranny. In 334 Lesbos served as a base for the Persian admiral Memnon, but was taken by Alexander of Macedon. During the Third Macedonian War the Lesbians sided with Perseus against Rome; similarly in 88 they became eager allies of Mithradates VI of Pontus, and Mytilène stood a protracted siege on his behalf. This town, nevertheless, was raised by Pompey to the status of a free community, thanks no doubt to his confidant Theophanes, a native of Mytilène.

Of the other towns on the island, Antissa, Eresus and Pyrrha possess no separate history. Methymna in the 5th and 4th centuries sometimes figures as a rival of Mytilène, with an independent policy. Among the distinguished Lesbians, in addition to those cited, may be mentioned the clycic poet Lesches, the historian Hellanicus and the philosophers Theophrastus and Cratippus.

During the Byzantine age the island, which now assumes the name of Mytilène, continued to flourish. In 1091 it fell for a while into the hands of the Seljuk, and in the following century it was repeatedly occupied by the Venetians. In 1224 it was recovered by the Byzantine emperors, who in 1354 gave it as a dowry to the Genoese family Gattilusio. After prospering under
their administration. Mytlene passed in 1462 under Turkish control, and has since had an uneventful history. The present population is about 15,000 of whom 13,000 are Turks and Moslems and 11,000 Greeks. See Strabo, xi. pp. 617-619; Herodotus ii. 178, iii. 39, vi. 8, 14; Thucydides iii. 2-50; Xenophon, Hellenica, i., ii.; S. Pleni, Lesbiacorum Liber (Berlin, 1828); C. T. Newton, Travels and Discoveries in the Levant (London, 1865); B. V. Head, History of Greece (Oxford, 1887), pp. 487-488; E. L. Hicks and G. F. Hill, Greek Historical Inscriptions (Oxford, 1901), Nos. 61, 94, 101, 139, 164; Conze, Reise auf der Insel Lesbos (1865); Koldewey, Antike Bausteine auf Lesbos (Berlin, 1890).

LESCHES. See Marquis de la Rochetaule, one of the cyclic poems. According to the usually accepted tradition, he was a native of Pyrrha in Lesbos, and flourished about 660 B.C. (other places him about 50 years earlier). The Little Iliad (Ἰδία ἡμίπηθ) of the Epic Cycle is the principal source for the Iliad and the Trojan War. It is a short but vivid account of the war between the Greeks and the Trojans, and is an important source for understanding the political and social background of the time. The work is attributed to Homer, the greatest Greek poet, who lived around 800 BC. The Iliad is a key text in the Western tradition of literature and culture, and has had a profound influence on the development of Western thought and civilization.
LESINA—LESLEY, J.

Kurina or Lesghians proper. Komarov \(^1\) gives the total number of the tribes as twenty-seven, all speaking distinct dialects. Despite this, the Lesghian peoples, with the exception of the Udi and Kubatschi, are held to be ethnically identical. The Lesghians are not usually so good-looking as the Circassians or the Chechenzes. They are tall, powerfully built, and their hybrid descent is suggested by the range of colouring, some of the tribes exhibiting quite fair, others quite dark, individuals. Among some there is an obvious mongoloid strain. In disposition they are intelligent, bold and persistent, and capable of reckless bravery, as was proved in their struggle to maintain their independence. They are capable of enduring great physical fatigue. They live a semi-savage life on their mountain slopes, for the most part living by hunting and stock-breeding. Little agriculture is possible. Their industries are mainly restricted to smith-work and cutlery and the making of felt cloaks, and the women weave excellent shawls. They are for the most part fanatical Mahommedans.

See Moritz Wagger, Schamyl (Leipzig, 1854); von Seidlitz, "Ethnographie des Kaukasus," in Petermann's Mitteilungen (1880); Ernest Chantre, Recherches anthropologiques dans le Caucasé (Lyon, 1885-1887); J. de Morgan, Recherches sur les origines des peuples du Caucasé (Paris, 1889).

LESINA (Serbo-Croatian, Hvar), an island in the Adriatic Sea, forming part of Dalmatia, Austria. Lesina lies between the islands of Braza on the north and Curzola on the south; and is divided by a channel of Sabinocello by the Narenta river. Its length is 41 m.; its greatest breadth less than 4 m. It has a steep rocky coast with a chain of thinly wooded limestone hills. The climate is mild, and not only the grape and olive, but dates, figs and the carob or locust-bean flourish.

The cultivation of these fruits, boat-building, fishing and the preparation of rosemary essence and liqueurs are the principal resources of the islanders. Lesina (Hvar) and Cittavecchia (Starigrad) are the principal towns and seaports, having respectively 2138 and 3120 inhabitants. Lesina, the capital, contains an arsenal, an observatory and some interesting old buildings of the 16th century. It is a Roman Catholic bishopric, and the centre of an administrative district, which includes Cittavecchia, Lissa, and some small neighbouring islands. Pop. (1900) of island 18,091, of district 27,028.

To the primitive "Illyrian" race, whose stone cists and bronze implements have been disinterred from barrows near the capital, may perhaps be attributed the " Cyclopean" walls at Cittavecchia. About 385 B.C., a Greek colony from Paros built a city on the site of the present Lesina, naming it Paros or Pharos. The forms Phara, Pharia (common among Latin writers), and Pityeia, also occur. In 220 B.C. the island was betrayed to the Romans by Demetrius, lieutenant of the Illyrian queen Teuta; but in 219, as Demetrius proved false to Rome also, his capital was razed by Lucius Aemilius Paullus. Neos Pharos, now Cittavecchia, took its place, and flourished until the 6th century, when it was laid waste by barbarian invaders. Constantine Porphyrogenitus mentions Lesina as a colony of pagan Slavs, in the 10th century. Throughout the middle ages it remained a purely Slavonic community; and its name, which appears in old documents as Lina, Lenua or Lysena, is almost certainly derived from the Slavonic *lye*, "forest," not from the Italian lesina, "an awl." But the old form Pharia persisted, as Far or Hvar, with the curious result that the modern Serbo-Croatian name is Greek, and the modern Italian name Slavonic in origin. Lesina became a bishopric in 1145, and received a charter from Venice in 1331. It was sacked by the enemies of Venice in 1534 and 1538; ceded to Hungary in the same year; held by Ragusa from 1413 to 1416; and incorporated in the Venetian dominions in 1420. During the 16th century Lesina city had a considerable maritime trade, and, though sacked and partly burned by the Turks in 1571, it remained the chief naval station of Venice, in these waters, until 1726, when it was superseded by Curzola. Passing to Austria in 1707, and to France in 1805, it withstood a Russian attack in 1807, but was surrendered by the French in 1813, and finally annexed to Austria in 1815.

LESION (through Fr. from Lat. laesio injury, laedere, to hurt), an injury, hurt, damage. In Scots law the term is used of damage suffered by a party in a contract sufficient to enable him to bring an action for setting it aside. In pathology, the chief use, the word is applied to any morbid change in the structure of an organ, whether shown by visible changes or by disturbance of function.

LESKOVATS (Leskovatz or Leskovac), a town in Servia, between Nish and Vranja, on the railway line from Nish to Salonica. Pop. (1901) 13,707. It is the headquarters of the Servian hemp industry, the extensive plain in which the town lies growing the best flax and hemp in all the Balkan peninsula. The plain is not only the most fertile portion of Servia, but also the best cultivated. Besides flax and hemp, excellent tobacco is grown. Five valleys converge on the plain from different directions, and the inhabitants of the villages in these valleys are all occupied in growing flax and hemp, which they send to Leskovats to be stored or manufactured into ropes. After Belgrade and Nish, Leskovats is the most prosperous town in Servia.

LESLEY, JOHN (1527-1596), Scottish bishop and historian, was born in 1527. His father was Gavin Lesley, rector of Kingussie. He was educated at the university of Aberdeen, where he took the degree of M.A. In 1538 he obtained a dispensation permitting him to hold a benefice, notwithstanding his being a natural son, and in June 1546 he was made an acolyte in the cathedral church of Aberdeen, of which he was afterwards appointed a canon and prebendary. He also studied at Poitiers, at Toulouse and at Paris, where he was made doctor of laws in 1553. In 1558 he took orders and was appointed official of Aberdeen, and inducted into the parsonage and prebend of Oxne. At the Reformation Lesley became a champion of Catholicism. He was present at the disputation held in Edinburgh in 1561, when Knox and Willoch were his antagonists. He was one of the commissioners sent the same year to bring over the young Queen Mary to take the government of Scotland. He returned in her train, and was appointed a privy councillor and professor of canon law in King's College, Aberdeen, and in 1565 one of the senators of the college of justice. Shortly afterwards he was made abbot of Lindores, and in 1565 bishop of Ross, the election to the see being confirmed in the following year. He was one of the sixteen commissioners appointed to revise the laws of Scotland, and the volume of the Acts and Constitutions of the Realm of Scotland known as the Black Acts was, chiefly owing to his care, printed in 1566.

The bishop was one of the most steadfast friends of Queen Mary. After the failure of the royal cause, and whilst Mary was a captive in England, Lesley (who had gone to her at Bolton) continued to exert himself on her behalf. He was one of the commissioners at the conference at York in 1568. He appeared as her ambassador at the court of Elizabeth to complain of the injustice done to her, and when he found he was not listened to he laid plans for her escape. He also projected a marriage for her with the duke of Norfolk, which ended in the execution of that nobleman. For this he was put under the charge of the bishop of London, and then of the bishop of Ely (in Holborn), and afterwards imprisoned in the Tower of London. During his confinement he collected materials for his history of Scotland, by which his name is now chiefly known. In 1571 he presented the latter portion of this work, written in Scots, to Queen Mary to amuse her; and he wrote for her use his Pax Consolationis, and the queen devoted some of the hours of her captivity to translating a portion of it into French verse. In 1573 he was liberated from prison, but was banished from England. For two years he attempted unsuccessfully to obtain the assistance of Continental princes in favour of Queen Mary. While at Rome in 1578 he published his Latin history De Origine, Moribus, et Rebus Gestis Scotiorum. In 1579 he went to France, and was made suffragan and vicar-general of the archbishopric.
of Rouen. Whilst visiting his diocese, however, he was thrown into prison, and had to pay 3000 pistoles to prevent his being given up to Elizabeth. During the remainder of the reign of Henry III. he lived unmolested, but on the accession of the Protestant Henry IV. he again fell into trouble. In 1590 he was thrown into prison, and had to purchase his freedom at the same expense as before. In 1593 he was made bishop of Coutances in Normandy, and had licence to hold the bishopric of Ross till he should obtain peaceable possession of the former see. He retired to an Augustinian monastery near Brussels, where he died on the 31st of May 1596.

The chief works of Lesley are as follows: A Defence of the Honour of ... Marie, Queen of Scotland, by Eugenius Ducepaulus (London, 1607); translation of the Terzi della Regione, or a Treatise concerning the Defence of the Honour of Marie, Queen of Scotland, made by Morgan Philippis, Bachelor of Divinitie, Piae effectus animi consolationes, ad Mariam Scot. Reg. (Paris, 1574); De novis, mortuis et rebus gestis Societatis Ibrici decem (Rome, 1578); De illustrissim. feminarum in republica administrando autoritate libellus (Reims, 1580; a Latin version of a tract on "The Lawfulness of the Regiment of Women", cf. Knox's pamphlet on the subject); De successione Ibrici, or the "History of the succession sibi justae vindicat" (Reims, 1580; translated in 1834). The history of Scotland from 1436 to 1561 owes much, in its earlier chapters, to the accounts of Hector Boece (q. v.) and John Major (q. v.), though the chief part of the topographical matter is first-hand. In the later sections he gives an independent account (from the Catholic point of view) which is a valuable supplement and a corrective in many details, to the works of Buchanan and Knox. A Scots version of the history was written in 1613, by John Deverie, in the Scottish Cloister at Regensburg. It has been printed for the Scottish Text Society (2 vols., 1888-95) under the editorship of the Rev. E. G. Cody, O.S.B. A slight sketch by Lesley of Scottish history, from 1562 to 1571, has been translated by Forbes-Leith in his Narrative of Scottish Catholics (1883), from the original MS. now in the Vatican.

LESLEY, J. Peter (1819-1903), American geologist, was born in Philadelphia on the 17th of September 1819. It is recorded by Sir A. Geikie that "He was christened Peter after his father and grandfather, and at first wrote his name 'Peter Lesley, Jr.,' but disliking the Christian appellation that had been given to him, he eventually transformed his signature by putting the J. of 'Junior' at the beginning." He was educated for the ministry at the university of Pennsylvania, where he graduated in 1838; but the extent of his religious studies having told upon his health, he served for a time as sub-assistant on the first geological survey of Pennsylvania under Professor H. D. Rogers, and was afterwards engaged in a special examination of the coal regions. On the termination of the survey in 1841 he entered Princeton seminary and renewed his theological studies, at the same time giving his leisure time to assist Professor Rogers in preparing the final report and map of Pennsylvania. He was licensed to preach in 1844; he then paid a visit to Europe and entered on a short course of study at the university of Halle. Returning to America he worked during two years for the American Tract Society, and at the close of 1847 he joined Professor Rogers again in preparing geological maps and sections at Boston. He then accepted the pastorate of the Congregational church at Milton, a suburb of Boston, where he remained until 1851, when, his position being vacated in consequence of the anomalous nature of the church, he abandoned the ministry and entered into practice as a consulting geologist. In the course of his work he made elaborate surveys of the Cape Breton coal-field, and of other coal and iron regions. From 1855 to 1859 he was secretary of the American Iron Association; for twenty-seven years (1858-1885) he was secretary and librarian of the American Philosophical Society; from 1872 to 1878 he was professor of geology and dean of the faculty of science in the university of Pennsylvania, and from 1874-1893 he was in charge of the second geological survey of the state. He then retired to Milton, Mass., where he died on the 1st of June 1903. He published Manual of Coal and its Topography (1859); The Iron Manufacturer's Guide to the Furnaces, Forges and Rolling Mills of the United States (1859).

Leslie, Charles (1569-1721), Anglican primate, divine, son of John Leslie (1571-1657), bishop of Bapteme and afterwards of Clogher, was born in July 1650 in Dublin, and was educated at Enniskillen school and Trinity College, Dublin. Going to England he read law for a time, but soon turned his attention to theology, and took orders in 1680. In 1687 he became chancellor of the cathedral of Connor and a justice of the peace, and began a long career of public controversy by responding in public disputation at Monaghan to the challenge of the Roman Catholic bishop of Clogher. Although a vigorous opponent of Roman Catholicism, Leslie was a firm supporter of the Stuart dynasty, and, having declined at the Revolution to take the oath to William and Mary, he was on this account deprived of his benefice. In 1689 the growing troubles in Ireland induced him to withdraw to England, where he employed himself for the next twenty years in writing various controversial pamphlets in favour of the nonjurating cause, and in numerous polemics against the Quakers, Jews, Socinians and Roman Catholics, and especially in that against the Deists with which his name is now most commonly associated. He had the keenest sense for every form of heresy and was especially zealous in his defence of the sacra-
ments. A warrant having been issued against him in 1710 for his pamphlet The Good Old Cause, or, Lying in Truth, he resolved to quit England and to accept an offer made by the Pretender (with whom he had previously been in frequent correspondence) that he should reside with him at Bar-le-Duc. After the failure of the Stuart cause in 1715, Leslie accompanied his patron into Italy, where he remained until 1721, in which year, having found his sojourn amongst Roman Catholics extremely unpleasant, he sought and obtained permission to return to his native country. He died at Glaslough, Monaghan, on the 13th of April 1722.

Theological Works of Leslie were collected and published by himself in 2 vols. folio in 1721; a later edition, slightly enlarged, appeared at Oxford in 1832 (7 vols. 8vo). Though marred by persistent arguing in a circle they are written in lively style and show considerable acquaintance with the most recent methods of dealing with the controversies of his time. He was a cautious and careful writer, and his opinions are given in a way that makes several converts by his reasonings, and Johnson declared that "Leslie was a reasoner, and a reasoner who was not to be reasoned against." An historical interest in all that now attaches to Leslie besides and to his method of writing, as may be seen and promised in the title of his best-known work is contrasted with the actual performance. The book professes to be A Short and Easy Method with the Deists, wherein the certainty of the Christian Religion is Demonstrated by Infallible Proof from Four Rules, which are inapplicable to any imposture that ever yet has been, or that possibly be (1697). The four rules which, according to Leslie, have only to be rigorously applied in order to establish not the probability merely but the complete certainty of Christianity, are simply these: (1) that the matter of fact be such as that man's outward senses, their eyes and ears, may be judges of it; (2) that it be done publicly, in the face of the world; (3) that not only public monuments be kept up in memory of it, but some outward actions be performed; (4) that such monuments and such actions or observances be instituted and do commence from the time that the matter of fact was done. Other publications of Leslie are The Snake in the Grass (1696); against the Quakers; A Short Method of the same (1685); Gallant Resistance an attack on Villian III. (1695); The Socinian Controversy Discussed (1697); The True Notion of the Catholic Church (1703); and The Case Stated between the Church of Rome and the Church of England (1713).

Leslie, Charles Robert (1794-1859), English gene-
ra painter, was born in London on the 13th of October 1794. His parents were both American. At the age of five he returned with them to their native country. They settled in Philadelphia, where their son was educated and afterwards apprenticed to a bookseller. He was, however, mainly interested in painting and the drama, and when George Frederick Cooke visited the city he executed a portrait of the actor, from re-
collection of him on the stage, which was considered a work of such promise that a fund was raised to enable the young artist to study in Europe. He left for London in 1811, bearing introductions which procured for him the friendship of West, Beechy, Allston, Coleridge and Washington Irving, and was admitted as a student of the Royal Academy, where he carried off two silver medals. At first, influenced by West and Fuseli, he essayed "high art," and his earliest important subject depicted Saul and the Witch of Endor; but he soon discovered his true
aptitude and became a painter of cabinet-pictures, dealing, not like those of Wilkie, with the contemporary life that surrounded him, but with scenes from the great masters of fiction, from Chasteauneuf and Cervantes, Addison and Molière, Swift, Sterne, Fielding and Smollett. Of individual paintings we may specify “Sir Roger de Coverley going to Church” (1819); “May-day in the Time of Queen Elizabeth” (1821); “Sancho Panza and the Duchess” (1824); “Uncle Toby and the Widow Wadman” (1831); La Malade Imaginaire, act iii. sc. 6 (1843); and the “Duke’s Chaplain Enraged leaving the Table,” from Don Quixote (1849). Many of his more important subjects exist in varying replicas. He possessed a sympathetic imagination, which enabled him to enter freely into the spirit of the author whom he illustrated, a delicate perception for female beauty, an unfailing eye for character and its outward manifestation in face and figure, and a genial and sunny sense of humour, guided by an instinctive refinement which prevented it from overstepping the bounds of good taste. In 1821 Leslie was elected A.R.A., and five years later full academician. In 1833 he left for America to become teacher of drawing in the military academy at West Point, but the post proved an irksome one, and in some six months he returned to England. He died on the 6th of May 1859.

In addition to his skill as an artist, Leslie was a ready and pleasant writer. His Life of his friend Constable, the landscape painter, appeared in 1843, and his Handbook for Young Painters, a volume compiled of his best letters and reminiscences, was published by the Royal Academy, in 1855. In 1860 Tom Taylor edited his Auto-

Leslie, Fred [Frederick Hobson] (1855–1892), English actor, was born at Woolwich on the 1st of April 1855. He made his first stage appearance in London as Colonel Hardy in Paul Pry in 1878. He had a good voice, and in 1882 made a great reputation as Rip Van Winkle in Planquette’s opera of that name at the Comedy. In 1885 he appeared at the Gaiety as Jonathan Wild in H. P. Stephens and W. Yardley’s burlesque Little Jack Sheppard. His extraordinary success in this part determined his subsequent career, and for some years he and Nelly Farren, with whom he played in perfect association, were the pillars of Gaiety burlesque. Leslie’s “Don Caesar de Bazan” in Rey Blas, or the Blasé Rout, was perhaps the most popular of his later parts. In all of them it was his own versatility and entertaining personality which formed the attraction; whether he sang, danced, whistled or “gagged,” his performance was an unending flow of high spirits and ludicrous charm. Under the pseudonym of “A. C. Torr” he was acknowledged on the programmes as part-author of these burlesques, and while on occasion he acted in more serious comedy, for which he had undoubtedly capacity, his fame rests on his connexion with them. In 1881 and 1883 he played in America. He died on the 7th of December 1892.

See W. T. Vincent, Recollections of Fred Leslie (1894).

Leslie, Sir John (1766–1832), Scottish mathematician and physicist, was born of humble parentage at Largo, Fifeshire, on the 16th of April 1766, and received his early education there and at Leven. In his thirteenth year, encouraged by friends who had even then remarked his aptitude for mathematical and physical science, he entered the university of St Andrews. On the completion of his arts course, he nominally studied divinity at Edinburgh until 1787; in 1788–1789 he spent rather more than a year as private tutor in a Virginian family, and from 1790 till the close of 1792 he held a similar appointment at Etruria in Staffordshire, with the family of Josiah Wedgwood, employing his spare time in experimental research and in preparing a translation of Buffon’s Natural History of Birds, which was published in eight volumes, 1793. In 1793 he returned to the university.

For the next twelve years (passed chiefly in London or at Largo, with an occasional visit to the continent of Europe) he continued his physical studies, which resulted in numerous papers contributed by him to Nicholson’s Philosophical Journal, and in the publication (1804) of the Experimental Inquiry into the Nature and Properties of Heat, a work which gained him the Rumford Medal of the Royal Society of London. In 1805 he was elected to succeed John Playfair in the chair of mathematics at Edinburgh, not, however, without violent though unsuccessful opposition on the part of a narrow-minded clerical party who accused him of heresy in something he had said as to the “unsophis-
ticated notions of mankind” about the relation of cause and effect. During his tenure of this chair he published two volumes of a Course of Mathematics—the first, entitled Elements of Geo-

metry, Geometrical Analysis and Plane Trigonometry, in 1809, and the second, Geometry of Curve Lines, in 1813; the third volume, on Descriptive Geometry and the Theory of Solids was never completed. With reference to his invention (in 1810) of a process of artificial congelation, he published in 1813 A Short Account of Experiments and Instruments depending on the relations of Air to Heat and Moisture; and in 1818 a paper by him “On certain impressions of cold transmitted from the higher atmosphere, with an instrument (the aethrioscope) adapted to measure them,” appeared in the Transactions of the Royal Society of Edinburgh. In 1819, on the death of Playfair, he was promoted to the more congenial chair of natural philosophy, which he continued to hold until his death, and in 1823 he published, chiefly for the use of his class, the first volume of his never-completed Elements of Natural Philosophy. Leslie’s main contributions to physics were made by the help of the “differential thermometer,” an instrument whose invention was contested with him by Count Rumford. By adapting to this instrument various ingenious devices he was enabled to employ it in a great variety of investigations, connected especially with photometry, hygroscopy and the temperature of space. In 1820 he was elected a corresponding member of the Institute of France, the only distinction of the kind which he valued, and early in 1832 he was created a knight. He died at Coates, a small property which he had acquired near Largo, on the 3rd of November 1821.

Leslie, Thomas Edward Cliffe (1827–1882), English economist, was born in the county of Wexford in (as is believed) the year 1827. He was the second son of the Rev. Edward Leslie, prebendary of Dromore, and rector of Annahilt, in the county of Down. His family was of Scottish descent, but had been connected with Ireland since the reign of Charles I. Amongst his ancestors were those that accomplished prelate, John Leslie (1571–1671), bishop first of Raphoe and afterwards of Clogher, who, when holding the former see, offered so stubborn a resistance to the Cromwellian forces, and the bishop’s son Charles (see above), the nonjuror. Cliffe Leslie received his elementary education from his father, who resided in England, though holding church prebents as well as possessing some landed property in Ireland; by him he was taught Latin, Greek and Hebrew, at an unusually early age; he was afterwards for a short time under the care of a clergyman at Clapham, and was then sent to King William’s College in the Isle of Man, where he remained until, in 1842, being then only fifteen years of age, he entered Trinity College, Dublin. He was a distinguished student there, obtaining, besides other honours, a classical scholarship in 1845, and a senior moderatorship (gold medal) in mental and moral philosophy at his degree examination in 1846. He became a law student at Lincoln’s Inn, was for two years a pupil in a conveyancer’s chambers in London, and was called to the English bar. But his attention was soon turned from the pursuit of legal practice, for which he seems never to have had much inclination, by his appointment, in 1853, to the professorship of jurisprudence and political economy in Queen’s College, Belfast. The duties of this chair requiring only short visits to Ireland in certain terms of each year, he continued to reside and prosecute his studies in London, and became a frequent contributor to the leading periodicals and other periodicals. In 1850 he collected a number of his essays, adding several new ones, into a volume entitled Land Systems and Industrial Economy of Ireland, England and Continental Countries. J. S. Mill gave a full account of the contents of this work in a paper in the Fortnightly Review, in which he pronounced Leslie to be “one of the best living writers on applied political economy.” Mill had sought his acquaintance on reading
his first article in *Macmillan's Magazine*; he admired his talents and took pleasure in his society, and treated him with a respect and kindness which Leslie always gratefully acknowledged.

In the frequent visits which Leslie made to the continent, especially to Belgium and some of the less-known districts of France and Germany, he occupied himself much in economic and social observation, studying the effects of the institutions and system of life which prevailed in each region, on the material and moral condition of its inhabitants. In this way he gained an extensive and accurate acquaintance with continental rural economy, of which he made excellent use in studying parallel phenomena at home. The accounts he gave of the results of his observations were among his happiest efforts; "no one," said Mill, "was able to write narratives of foreign visits at once so instructive and so interesting." In these excursions he made the acquaintance of several distinguished persons, amongst others of M. Léonce de Lavergne and M. Emile de Laveleye. To the memory of the former of these he afterwards paid a graceful tribute in a biographical sketch (*Fortnightly Review*, February 1881); and to the close of his life there existed between him and M. de Laveleye relations of mutual esteem and cordial intimacy.

Two essays of Leslie's appeared in volumes published under the auspices of the Cobden Club, one on the "Land System of France" (2nd ed., 1870), containing an earnest defence of *la petite culture* and still more of *la petite propriété*; the other on "Financial Reform" (1871), in which he exhibited in detail the impediments to production and commerce arising from indirect taxation. Many other articles were contributed by him to reviews between 1875 and 1879, including several discussions of the history of prices and the movements of wages in Europe, and a sketch of life in Auvergne in his best manner: the most important of them, however, related to the philosophical method of political economy, notably a memorable one which appeared in the Dublin University periodical, *Hermathena*. In 1870 the provost and senior fellows of Trinity College published for him a volume in which a number of these articles were collected under the title of *Essays in Political and Moral Philosophy*. These and some later essays, together with the earlier volume on *Land Systems*, form the essential contribution of Leslie to economic literature. He had long contemplated, and had in part written, a work on English economic and legal history, which would have been his *magnum opus*—a more substantial fruit of his genius and his labours than anything he has left. But the MS. of this treatise, after much pains had already been spent on it, was unaccountably lost at Nancy in 1872; and, though he hoped to be able speedily to reproduce the portions and finish the work that he had left in a state fit for publication, when the nature of it would have been may have been gathered from an essay on the "History and Future of Profit" in the *Fortnightly Review* for November 1881, which is believed to have been in substance an extract from it.

That he was able to do so much may well be a subject of wonder when it is known that his labours had long been impeded by a painful and depressing malady, from which he suffered severely at intervals, whilst he never felt secure from its recurring attacks. To this disease he in the end succumbed at Belfast, on the 27th of January 1882.

Leslie's work may be divided under two heads, that of applied political economy and that of discussion on the philosophical method of the science. The *Land Systems* belonged principally to the former division. The author perceived the great and growing importance for the social welfare of both Ireland and England of what is called "the land question," and treated in this volume at once with breadth of view and with a rich variety of illustrative detail. His general purpose was to show that the territorial systems of both countries were so enmeshed with elements of feudal origin as to be absolutely unfitted to reproduce the missions and tendencies of a modern society. The policy he recommended is summed up in the following list of requirements: "a simple jurisprudence relating to land, a law of equal intestate succession, a prohibition of entail, a legal security for conveyancers, improvements, an open registration of title and transfer, and a considerable number of peasant properties." This volume is full of practical good sense, and exhibits a thorough knowledge of home and foreign agricultural economy; and in the handling of the subject is everywhere shown the special power which its author possessed of making what he wrote interesting as well as instructive. The way in which sagacious observation and shrewd comment are constantly intermingled in the discussion not seldom reminds us of his master, whose manner was so congenial to Leslie than the abstract and arid style of Ricardo.

But what, more than anything else, marks him as an original thinker and gives him a place apart among contemporary economists is the exposition of a new and original method in political economy. Both at home and abroad there has for some time existed a profound and growing dissatisfaction with the method and many of the doctrines of the hitherto dominant school, which, it is argued, under a "positivist" garb, "exactness" disguises a real hollowness and discordance with fact. It is urged that the attempt to deduce the economic phenomena of a society from the so-called universal principles of the desire of individuals to acquire commodities, and to distribute these commodities apart from the general social conditions and historic development of which they are the outcome. Of this movement of thought Leslie was the principal representative, if not the originator, in England. There is no doubt, for he has himself placed it on record, that the first influence which impelled him in the direction of the historical method was that of Sir Henry Maine, by whose personal teaching of jurisprudence, as well as by the example of his writings, he was led to look at the present economic structure and state of society as the result of a long evolution. The study of those German economists who represent similar tendencies doubtless confirmed him in the new line of thought on which he had entered, though he professed to have been further indebted to M. Léonce, perhaps, in some small degree to Roscher. And the writings of Comte, whose "prophetic genius," as exhibited in the *Philosophie Positive*, he admired and proclaimed, though he did not accept his ideas as a philosophy, must have powerfully contributed to form him the habit of regarding economic science as only a single branch of sociology, which should always be kept in close relation to the others. The earliest writing in which Leslie's revolt against the so-called "orthodox" school is expressed is an essay on *Land Tenures,* which was first published in 1868 and was reproduced as an appendix to the volume on *Land Tenures.* In this, after exposing the infancy of the theory of the wage-fund, and showing the utter want of agreement between its results and the observed phenomena, he concludes by declaring that "political economy must be content to rank as an inductive, instead of a purely deductive science," and that, by "putting the human character and its result in a world of real truth far more than a full compensation for the forfeiture of a fictitious title to mathematical exactness and certainty." But it is in the essays collected in the volume of 1879 that his attitude in relation to the question of public policy most completely appears. In one of these, on "the political economy of Adam Smith," he exhibits in a very interesting way the co-existence in the *Wealth of Nations* of historical-inductive investigation in the manner of Montesquieu with a principle speculative on the logical-epaphysical bases, and points out the error of ignoring the former element, which is the really characteristic feature of Smith's social philosophy, and places him in strong contrast with his *solidary* followers of the school of historical-iuristic essays. The *Future of Profit* and the essays on Smith's contributions against the "orthodox school," as well as the most luminous account and the most powerful vindication of the new direction, was that of which we have above spoken as having first appeared in *Hermathena.* It may be recommended as exhibiting the best extant presentation of one of the two contending views of economic method. On this essay mainly rests the claim of Leslie to be regarded as the founder and first head of the English historical school of political economy. Those who share his views on the philosophical constitution of the science regard the work he did, notwithstanding its unsystematic character, as, in reality the most important done by any English economists in the latter half of the 19th century. But even most of his partizans will admit that for scholarly work he did excellent service by insisting on a kind of inquiry, previously too much neglected, which was of the highest interest and value in whatever relation it might be supposed to stand to the establishment of a real truth. The members of both groups acknowledge his great learning, his patient and conscientious habits of investigation and the large social spirit in which he treated the problems of his science.

**Leslie**, a police burgh of Fifehire, Scotland. Pop. (1901) 3587; It lies on the Leven, the vale of which is overlooked by the town, 4 m. W. of Markinch by the North British railway. The industries include paper-making, flax-spinning, bleaching and linen-weaving. The old church claims to be the "Christ's Kirk on the Green" of the ancient ballads of that name. A stone on the Green, called the Bull Stone, is said to have been used when bull-baiting was a popular pastime. Leslie House, the seat of the earl of Rithes, designed by Sir William Bruce, rivalled Holyrood in magnificence. It was noted for its tapestry and its gallery of family portraits and other pictures, including a
portrait of Rembrandt by himself. Daniel Defoe considered its park the glory of the kingdom. The mansion sustained serious damage from fire in 1809. Norman Leslie, master of Rothes, was concerned in the killing of Cardinal Beaton (1546), and the dagger with which John Leslie, Norman's uncle, struck the fatal blow is preserved in Leslie House.

Markinch (pop. 1490), a police burgh situated between Conland Burn and the Leven, 72 m. N. by E. of Kirkcaldy by the British railway, is a place of great antiquity. A cell of the Culeux was established here by one of the last of the Celtic bishops, the site of which may possibly be marked by the ancient cross of Balgonie. Markinch is also believed to have been a residence of the earlier kings, where prior to the 11th century they occasionally administered justice; and in the reign of William the Lion (d. 1214) the warrantors of goods alleged to have been stolen were required to appear there. Its industries comprise bleaching, flax-spinning, paper-making, distilling and coal mining. Balgonie Castle, close by, the keep of which is 80 ft. high, was a residence of Alexander Leslie, the first earl of Leven, and at Balfour Castle were born Cardinal Beaton and his uncle and namesake, the archbishop of Glasgow.

Lеспинассе, Jeanne Julie Éléonore de (1732-1776), French author, was born at Lyons on the 26th of November 1732. A natural child of the comtesse d'Albon, she was brought up as the daughter of Claude Lеспинассе of Lyons. On leaving her convent school she became governess in the house of her mother's legitimate daughter, Mme de Vichy, who had married the brother of the marquise du Delfand. Here Mme du Delfand made her acquaintance, and, recognizing her extraordinary gifts, persuaded her to come to Paris as her companion. The alliance lasted ten years (1754-1764) until Mme du Delfand became jealous of the younger woman's increasing influence, when a violent quarrel ensued. Mlle de Lеспинассе set up a salon of her own which was joined by many of the most brilliant members of Mme du Delfand's circle. D'Alembert was one of the most assiduous of her friends and eventually came to live under the same roof. There was no scandal attached to this arrangement, which ensured D'Alembert's comfort and lent influence to Mlle de Lеспинассе's salon. Although she had neither beauty nor rank, her ability as a hostess made her reunions the most popular in Paris. She owes her distinction, however, not to her social success, but to circumstances which remained a secret during her lifetime from her closest friends. Two volumes of Lettres published in 1809 displayed her as the victim of a passion of a rare intensity. In virtue of this ardor, intense quality Sainte Beuve and other of her critics place her letters in the limited category to which belong the Latin letters of Heloise and those of the Portuguese Nun. Her first passion, a reasonable and serious one, was for the marquis de Mora, son of the Spanish ambassador in Paris. De Mora had come to Paris in 1765, and with some intervals remained there until 1772 when he was ordered to Spain for his health. On the way to Paris in 1774 to fulfil promises exchanged with Mlle de Lеспинассе, he died at Bordeaux. But her letters to Guibert, her worthless object of her fatal situation, begin from 1773. From the struggle between her affection for de Mora and her blind passion for her new lover they go on to describe her partial disenchantment with Guibert's marriage and her final despair. Mlle de Lеспинассе died on the 23rd of May 1776, her death being apparently hastened by the agitation and misery to which she had been for the last three years of her life a prey. In addition to the Lettres she was the author of two chapters intended as a kind of sequel to Sterne's Sentimental Journey.

Her Lettres... were published by Mme de Guibert in 1809 and a spurious additional collection appeared in 1820. Among modern editors may be mentioned that of Eugène Aveline (1887), lettres intitulées de Madame Mirlou de Lеспинассе à Condorcet, à D'Alembert, à Guibert, au comte de Crillon, edited by M. Charles Henry (1887), contains copies of the documents available for her biography. Mrs Humphry Ward's novel, Lady Rose's Daughter, owes something to the character of Mlle de Lеспинассе.

Les Sables d'Olonne, a seaport of western France, capital of an arrondissement of the department of Vendée, on an inlet of the Atlantic seaboard, 23 m. S.W. of La Roche-sur-Yon by rail. Pop. (1906) 11,547. The town stands between the sea on the south and the port on the north, while on the west it is separated by a channel from the suburb of La Chaume, built at the foot of a range of dunes 65 ft. high, which terminates southwards in the rocky peninsula of L'Aiguille. The beautiful smoothly sloping beach, 1 m. in length, is much frequented by bathers. To the north of Sables extend salt-marshes and oyster-parks, yielding 6,000,000 to 8,000,000 oysters per annum. Sables has a church built in the Late Gothic style towards the middle of the 17th century. The port, consisting of a tidal basin and a wet-dock, is accessible to vessels of 2000 tons, but is dangerous when the winds are from the south-west. The lighthouse of Barges, a mile out to sea, is visible for 17 to 18 nautical miles. The inhabitants are employed largely in sardine and tunny fishing; there are imports of coal, wood, petroleum and phosphates. Boat-building and sardine-preserving are carried on. The town has a sub-prefecture and a tribunal of first instance.

Founded by Basque or Spanish sailors, Sables was the first place in Poitou invaded by the Normans in 877. Louis XI., who was born there in 1461, granted the inhabitants various privileges, improved the harbour, and fortified the entrance. Captured and recaptured during the Wars of Religion, the town afterwards became a nursery of hardy sailors and privates, who harassed the Spaniards and afterwards the English. In 1696 Sables was bombarded by the combined fleets of England and Holland. In the middle of the 18th century hurricanes caused grievous damage to town and harbour.

Les Saintes-Marries, a coast village of south-eastern France in the department of Bouches-du-Rhône, 24 m. S.S.W. of Aries by rail. Pop. (1906) 544. Saintes-Marries is situated in the plain of the Camargue, 1½ m. E. of the mouth of the Petit-Rhône. It is the object of an ancient and famous pilgrimage due to the tradition that Mary, sister of the Virgin, and Mary, mother of James and John, together with their black servant Sara, Lazarus, Martha, Mary Magdalen and St Maximin fled thither to escape persecution in Judaea. The relics of the two Marys, who are said to have been buried at Saintes-Marries, are bestowed in the upper storey of the apse of the fortress-church, a remarkable building of the 12th century with crenelated and machicolated walls. Two festivals are held in the town, a less important one in October, the other, on the 24th and 25th of May, unique for its gathering of gypsies who come in large numbers to do honour to the tomb of their patroness Sara, contained in the crypt below the apse.

Lesse, one of the most romantic of the smaller rivers of Belgium. It rises at Ochamps in the Ardennes, and flowing in a north-westwardly course reaches the Meuse at Ansereemme, a few miles above Dinant. The river is only 49 m. long, but its meandering course may be judged by the fact that it is no more than 29 m. from Ochamps to Ansereemme in a straight line. There is a good deal of pretty scenery along this river, as, for instance, at Clergmont, but the most striking part of the valley is contained in the last 12 m. from Houyet to Ansereemme. This section of the river is bordered by extensive stretches of flats, fields of clays ranging from 300 to 500 ft. above the river. Here were discovered in the caves near Walzin the bones of prehistoric men, and other evidence of the primitive occupants of this globe at a period practically beyond computation.

Another curious natural feature of the Lesse is that on reaching the hill of Han it disappears underground, reappearing about 1 m. farther on at the village of that name. Here are the curious and interesting Han grottoes. The Lesse receives altogether in its short course the water of thirteen tributaries.

Lesseps, Ferdinand de (1805-1894). French diplomatist and maker of the Suez Canal, was born at Versailles on the 19th of November 1805. The origin of his family has been traced back as far as the end of the 14th century. His ancestors, it is believed, came from Scotland, and settled at Bayonne when that region was occupied by the English. One of his great-grandfathers was town clerk and at the same time secretary to Queen Anne of Neuburg, widow of Charles II. of Spain, exiled to Bayonne after the accession of Philip V. From the middle of the 18th century
the ancestors of Ferdinand de Lesseps followed the diplomatic career, and he himself occupied with real distinction several posts in these, succeeding from 1825 to 1849. His uncle was enabled by King Louis XVI, and his father was made a count by Napoleon I. His father, Mathieu de Lesseps (1774–1832), was in the consular service; his mother, Catherine de Grivégne, was Spanish, and aunt of the countess of Montijo, mother of the empress Eugénie. His first years were spent in Italy, where his father was occupied with his consular duties. He was educated at the College of Henry IV, in Paris. From the age of 18 years to 20 he was employed in the commissary department of the army. From 1825 to 1827 he acted as assistant vice-consul at Lisbon, where his uncle, Barthélemy de Lesseps, was the French chargé d'affaires. This uncle was an old companion of La Pérouse and a survivor of the expedition in which that navigator perished. In 1828 Ferdinand was sent as an assistant vice-consul to Tunis, where his father was consul-general. He courageously aided the escape of Youssouf, pursued, by the soldiers of the bey, of whom he was one of the officers, for violation of the seraglio law. Youssouf acknowledged this protection given him by a Frenchman by distinguishing himself in the ranks of the French army at the time the town was retaken by the Algerians. Ferdinand de Lesseps was also entrusted by his father with missions to Marshal Count Clausel, general-in-chief of the army of occupation in Algeria. The marshal wrote to Mathieu de Lesseps on the 18th of December 1830, “I have had the pleasure of meeting your son, who gives promise of sustaining with great credit the name he bears.” In 1832 Ferdinand de Lesseps was appointed vice-consul at Alexandria. To the placing in quarantine of the vessel which took him to Egypt is due the origin of his great conception of a canal across the isthmus of Suez. In order to help him to while away the time at the lazaretto, M. Mimaut, consul-general of France at Alexandria, sent him several books, among which was the memoir written upon the Suez Canal, according to Bonaparte’s instructions, by the civil engineer Lapère, one of the scientific members of the French expedition. This work struck de Lesseps’s imagination, and gave him the idea of piercing the African isthmus. This idea, moreover, was conceived in circumstances that there was no way to prepare the way for its realization. Mehemet Ali, who was the viceroy of Egypt, owed his position, to a certain extent, to the recommendations made in his behalf to the French government by Mathieu de Lesseps, who was consul-general in Egypt when Mehemet Ali was a simple colonel. The viceroy therefore welcomed Ferdinand affectionately, while Said Pacha, Mehemet’s son, began those friendly relations that he did not forget later, when he gave him the concession for making the Suez Canal. In 1833 Ferdinand de Lesseps was sent as consul to Cairo, and soon afterwards given the management of the consulate-general at Alexandria, a post that he held until 1837. While he was there a terrible epidemic of the plague broke out and lasted for two years, carrying off more than a third of the inhabitants of Cairo and Alexandria. During this time he went from one city to the other, according as the danger was more pressing, and constantly displayed an admirable zeal and an imperturbable energy. Towards the close of the year 1837 he returned to France, and on the 1st of December married Mlle Arthure Delamalle, daughter of the government prosecuting attorney at the court of Angers. By this marriage M. de Lesseps became the father of five sons. In 1839 he was appointed consul at Rotterdam, and in the following year transferred to Malaga, the place of origin of his mother’s family. In 1842 he was sent to Barcelona, and soon afterwards promoted to the grade of consular. In the course of a bloody insurrection in Catalonia, which ended in the bombardment of Barcelona, Ferdinand de Lesseps showed the most persistent bravery, rescuing from death, without distinction, the men belonging to the rival factions, and protecting and sending away not only the Frenchmen who were in danger, but foreigners of all nationalities. From 1848 to 1849 he was minister of France at Madrid. In the latter year the government of the French Republic confided to him a mission to Rome at the moment when it was a question whether the expelled pope would return to the Vatican with or without bloodshed. Following his interpretation of the instructions he had received, de Lesseps began negotiations with the existing government at Rome, according to which Pius IX. should peacefully re-enter the Vatican and the independence of the Romans be assured at the same time. But while he was negotiating, the elections in France had caused a change in the foreign policy of the government. His course was disapproved; he was recalled and brought before the council of state, which blamed his conduct without giving him a chance to justify himself. Rome, attacked by the French army, was taken by assault after a month’s sanguinary siege. M. de Lesseps then retired from the diplomatic service, and never afterwards occupied any public office. In 1853 he lost his wife and daughter at a few days’ interval. Perhaps his energy would not have been sufficient to sustain him against these repeated blows of destiny if, in 1854, the accession to the vicerealty of Egypt of his old friend, Said Pacha, had not given a new impulse to the ideas that had haunted him for the last twenty-two years concerning the Suez Canal. Said Pacha invited M. de Lesseps to pay him a visit, and on the 29th November 1854 he landed at Alexandria; on the 30th of the same month Said Pacha officially commissioned authorizing M. de Lesseps to pierce the isthmus of Suez.

A first scheme, indicated by him, was immediately drawn out by two French engineers who were in the Egyptian service, MM. Linant Bey and Mougel Bey. This project, differing from others that had been previously presented or that were in opposition to it, provided for a direct communication between the Mediterranean and the Red Sea. After being slightly modified, the plan was adopted in 1856 by an international commission of civil engineers to which it had been submitted. Encouraged by this approval, de Lesseps no longer allowed anything to stop him. He listened to no adverse criticism and receded before no obstacle. Neither the opposition of Lord Palmerston, who considered the projected disturbance as too radical not to endanger the commercial position of Great Britain, nor the opinions entertained in France as well as in England, that the sea in front of Port Said was full of mud which would obstruct the entrance to the canal, that the sands from the desert would fill the trenches—no adverse argument, in a word, could dishearten Ferdinand de Lesseps. His faith made him believe that his adversaries were in the wrong; but how great must have been this faith, which permitted him to undertake the work at a time when mechanical appliances for the execution of such an undertaking did not exist, and when for the utilization of the proposed canal there was as yet no steam mercantile marine! Impelled by his convictions and talent, supported by the emperor Napoleon III. and the empress Eugénie, he succeeded in rousing the patriotism of the French and obtaining by their subscriptions more than half of the capital of two hundred millions of francs which he needed in order to form a company. The Egyptian government subscribed for eighty millions’ worth of shares. The company was organized at the end of 1858. On the 25th of April 1859 the first blow of the pickaxe was given by Lesseps at Port Said, and on the 17th of November 1859 the canal was officially opened by the Khedive, Ismail Pacha (see Suez Canal). While the interests of this canal Lesseps had resisted the opposition of British diplomacy to an enterprise which threatened to give to France control of the shortest route to India, he acted loyally towards Great Britain after Lord Beaconsfield had acquired the Suez shares belonging to the Khedive, by frankly admitting to the board of directors of the company three representatives of the British government. The consolidation of interests which resulted, and which has been developed by the addition in 1884 of seven other British directors, chosen from among shipping merchants and business men, has augmented, for the benefit of all concerned, the commercial character of the enterprise.

Ferdinand de Lesseps steadily endeavoured to keep out of politics. If in 1869 he appeared to deviate from this principle by being a candidate at Marseilles for the Corps Législatif, it was because he yielded to the entreaties of the Imperial
government in order to strengthen its goodwill for the Suez Canal. Once this goodwill had been shown, he bore no malice towards those who rendered him his liberty by preferring Gambetta. He afterwards declined the other candidatures that were offered him: for the Senate in 1876, and for the Chamber in 1877. In 1873 he became interested in a project for uniting Europe and Asia by a railway to Bombay, with a branch to Peking. He subsequently encouraged Major Roudaire, who wished to transform the Sahara desert into an inland sea. The king of the Belgians having formed an International African Society, de Lesseps accepted the presidency of the French committee, facilitated M. de Brazza's explorations, and acquired stations that he subsequently abandoned to the French government. These stations were the starting-point of French Congo. In 1879 a congress assembled in the rooms of the Geographical Society at Paris, under the presidency of Admiral de la Roncière le Noury, and voted in favour of the making of the Panama Canal. Public opinion, it may be declared, designated Ferdinand de Lesseps as the head of the enterprise. It was upon that occasion that Gambetta bestowed upon him the title of Le Grand Français. He was not a man to shirk responsibility, and notwithstanding that he had reached the age of 74, he undertook to carry out the Panama Canal himself, and to raise the money and the man who was to bear the name and the honor of his father. He managed to draw down upon himself alone the burden of the condemnations pronounced. One of the consequences of the persecutions of which he was the object was to oblige him to spend three years, from 1886 to 1889, in England, where his participation in the management of the Suez Canal had won for him some strong friendships, and where he could live in retirement. With which, or whom, he chose to live, his memory and the name of his father were held by Englishmen. Ferdinand de Lesseps died at La Chenaie on the 7th of December 1884. He had contracted a second marriage in 1869 with Mlle Autard de Bragard, daughter of a former magistrate of Mauritius; and eleven out of twelve children of this marriage survived him. M. de Lesseps was a member of the French Academy, of the Academy of Sciences, of numerous scientific societies, Grand Cross of the Legion of Honour and of the Star of India, and had received the freedom of the City of London. According to some accounts he was unconscious of the disastrous events that took place during the closing months of his life. Others report that, feeling himself powerless to scatter the gathered clouds, and aware of his physical feebleness, he had had the moral courage to pass in the eyes of his family, which he did not wish to afflict, as the dupe of the efforts they employed to conceal the truth from him. This last version would not be surprising if we relied upon the following portrait, sketched by a person who knew him intimately: "Simple in his tastes, never the solace of himself, constantly preoccupied about others, extremely kind, he did not and would not recognize such a thing as evil. Of a confiding nature, he was inclined to judge others by himself. This naturally affectionate abandonment that every one felt in him had procured him profound attachments and rare devotions. He showed, while making the Suez Canal, what a gift he possessed for levying the pacific armies he conducted. He set duty above everything, had in the highest degree a reverence for honour, and placed his indomitable courage at the service of everything that was beneficial with an abnegation that nothing could tire. His marvellous physical and moral equilibrium gave him an evenness of temper which always

rundered his society charming. Whatever his cares, his work or his troubles, I have never noticed in him doubt or generous impulses and a love of humanity carried even to those heroic imprudences of which they alone are capable who devote themselves to the alleviation of humanity." No doubt this eulogy requires some reservations. The striking and universal success which crowned his work on the Suez Canal gave him an absolute notion of truth which brooked no contradiction, a despotism temper before which every one must bow, and against which, when he had once taken a resolution, nothing could prevail, not even the most authoritative opposition or the most legitimate entreaties. He had resolved to construct the Panama Canal without locks, to make it an uninterrupted navigable way. All attempts to dissuade him from this resolution failed before his tenacious will. At his advanced age he went with his youngest child to Panama to see with his own eyes the field of his new enterprise. He there beheld the Culebra and the Chagres; he saw the mountain and the stream, those two greatest obstacles of nature that sought to bar his route. He paid no heed to them, but began the struggle against the Culebra and the Chagres. It was against them that was broken his invincible will, sweeping away in the defeat the work of his own hands and even the name of his honour. But this atom, only grazed by calumny, has already been restored to him by postern, for he died poor, having been the first to suffer by the disaster to his illusions. Political agitators, in order to sap the power of the Opportunist party, did not hesitate to drag in the mud one of the greatest citizens of France. But when the Panama "scandal" had been forgotten, for centuries to come the traveller in saluting the statue of Ferdinand de Lesseps at the entrance of the Suez Canal will pay homage to one of the most powerful embodiments of the creative genius of the 19th century.

See G. Barnett Smith, The Life and Enterprises of Ferdinand de Lesseps (London, 1893); and Souvenirs de quarante ans, by Ferdinand de Lesseps (trans. by C. B. Pitman). (Em B.)

LESSING, GOTTHOLD EPHRAIM (1720-1781), German critic and dramatist, was born at Kamenz in Upper Lusatia (Oberlausitz), Saxony, on the 22nd of January 1729. His father, Johann Gottfried Lessing, was a clergyman, and, a few years after his son's birth, became pastor of a church in Berlin. He attended the Latin school of his native town. Lessing was sent in 1741 to the famous school of St Afa at Meissen, where he made such rapid progress, especially in classics and mathematics, that, towards the end of his school career, he was described by the rector as "a steed that needed double fodder." In 1746 he entered the university of Leipzig as a theological student. The philological lectures of Johann Friedrich Christ (1700-1756) and Johann August Ernesti (1707-1781) proved, however, more attractive than those on theology, and he attended the philosophical disputations presided over by his friend A. G. Kästner, professor of mathematics and also an epicurean of repute. Among Lessing's chief friends in Leipzig were C. F. Weisse (1726-1804) the dramatist, and Christlob Mylius (1722-1754), who had made some name for himself as a journalist. He was particularly attracted by the theatre then directed by the talented actress Karoline Neuber (1697-1760), who had assisted Gotschel in his efforts to bring the German stage into touch with literature. Frau Neuber even accepted for performance Lessing's first comedy, Der junge Geliebte (1748), which he began to write at school. His father naturally did not approve of these new interests and acquaintances, and summoned him home. He was only allowed to return to Leipzig on the condition that he would devote himself to the study of medicine. Some medical lectures he did attend, but as long as Frau Neuber's company kept together the theatre had an irresistible fascination for him.

In 1748, however, the company broke up, and Lessing, who had allowed himself to become surety for some of the actors' debts, was obliged to leave Leipzig too, in order to escape their creditors. He went to Wittenberg, and afterwards, towards the end of the year, to Berlin, where his friend Mylius had
established himself as a journalist. In Berlin Lessing now spent three years, maintaining himself chiefly by literary work. He translated three volumes of Charles Rollin’s Historie ancienne, wrote several plays—Der Misogyne, Der Freigeist, Die Juden—and in association with Mylius, began the Beitrag zur Historie und Anfahme des Theaters (1750), a periodical—which soon came to an end—for the discussion of matters connected with the drama. Early in 1751 he became literary critic to the Vossische Zeitung, and in this position laid the foundation for his reputation as a reviewer of learning, judgment and wit. At the end of 1751 he was in Wittenberg again, where he spent about a year engaged in unremitting study and research. He then returned to Berlin with a view to making literature his profession; and the next three years were among the busiest of his life. Besides translating for the booksellers, he issued several numbers of the Theatralische Bibliothek, a periodical similar to that to which he had been with Mylius; he also continued his work as critic to the Vossische Zeitung. In 1754 he gave a particularly brilliant proof of his critical powers in his Vademecum für Herrn G. Lange; as a retort to that writer’s overbearing criticism, Lessing exposed with scathing satire Lange’s errors in his popular translation of Horace.

By 1755 Lessing felt that his position was sufficiently assured to allow of him issuing an edition of his collected writings (Schriften, 6 vols., 1755-1758). They included his lyrics and epigrams, most of which had already appeared during his first residence in Berlin in a volume of Kleinkünigen, published anonymously. Much more important were the papers entitled Rettungen, in which he undertook to vindicate the character of various writers—Horace and writers of the Reformation period, such as Coelaeus and Cardanus—who had been misunderstood or falsely judged by preceding generations. The Schriften also contained Lessing’s early plays, and one new one, Miss Sara Sampson (1755). Hitherto Lessing had, as a dramatist, followed the methods of contemporary French comedy as cultivated in Leipzig; Miss Sara Sampson, however, marks the beginning of a new period in the history of the German drama.

This play, based more or less on Lillo’s Merchant of London, and influenced in its character-drawing by the novels of Richardson, is the first bürgerliches Trauerspiel, or “tragedy of common life” in German. It was performed for the first time at Frankfort-on-Oder in the summer of 1755, and received with great favour. Among Lessing’s chief friends during his second residence in Berlin were the philosopher Moses Mendelssohn (1729-1786), in association with whom he wrote in 1755 an admirable treatise, Pape ein Metaphysiker! tracing sharply the lines which separate the poet from the philosopher. He was also on intimate terms with C. F. Nicolai (1733-1811), a Berlin bookseller and rationalistic writer, and with the “German Horace” K. W. Ramler (1725-1758); he had also made the acquaintance of J. W. L. Gleim (1710-1803), the Halberstadt poet, and E. C. von Kleist (1715-1759), a Prussian officer, whose fine poem, Der Fröhling, had won for him Lessing’s warm esteem.

In October 1755 Lessing settled in Leipzig with a view to devoting himself more exclusively to the drama. In 1756 he accepted the invitation of Gottfried Winkler, a wealthy young merchant, to accompany him on a foreign tour for three years. They did not, however, get beyond Amsterdam, for the outbreak of the Seven Years’ War made it necessary for Winkler to return home without loss of time. A disagreement with his patron shortly after resulted in Lessing’s sudden dismissal; he demanded compensation and, although in the end the court decided in his favour, it was not until the case had dragged on for about six years. At this time Lessing began the study of medieval literature to which attention had been drawn by the Swiss critics, Bodmer and Breitinger, and wrote occasional criticisms for Nicolai’s Bibliothek der schönen Wissenschaften. In Leipzig Lessing had also an opportunity of developing his friendship with Kleist who happened to be stationed there. The two men were mutually attracted, and a warm affection sprang up between them. In 1758 Kleist’s regiment being ordered to new quarters, Lessing decided not to remain behind him and returned again to Berlin. Kleist was mortally wounded in the following year at the battle of Kunersdorf.

Lessing’s third residence in Berlin was made memorable by the Briefe, die neueste Literatur betreffend (1759-1756), a series of critical essays—written in the form of letters to a wounded officer—on the principal books that had appeared since the beginning of the Seven Years’ War. The scheme was suggested by Nicolai, by whom the Letters were published. In Lessing’s share in this publication, his critical powers and methods are to be seen at their best. He insisted especially on the necessity of truth to nature in the imaginative presentation of the facts of life, and in one letter he boldly proclaimed the superiority of Shakespeare to Corneille, Racine and Voltaire. At the same time he marked the immutable conditions to which even genius must submit if it is to succeed in its appeal to our sympathies. While in Berlin at this time, he collected with Ramler a selection from the writings of F. von Logau, an epigrammatist of the 17th century, and introduced to the German public the Lieder eines preussischen Grenadiers, by J. W. L. Gleim. In 1759 he published Philotas, a prose tragedy in one act, and also a complete collection of his fables, preceded by an essay on the nature of the fable. The latter is one of his best essays on criticism, defining with perfect lucidity what is meant by “action” in works of the imagination, and distinguishing the action of the fable from that of the epic and the drama.

In 1760, feeling the need of some change of scene and work, Lessing went to Breslau, where he obtained the post of secretary to General Tauentzien, to whom Kleist had introduced him in Leipzig. Tauentzien was not only a general in the Prussian army, but governor of Breslau, and director of the mint. During the four years which Lessing spent in Breslau, he associated chiefly with Prussian officers, went much into society, and developed a dangerous fondness for the gaming table. He did not, however, lose sight of his true goal; he collected a large library, and, after the conclusion of the Seven Years’ War, in 1763, he resumed more enthusiastically than ever the studies which had been partially interrupted. He investigated the early history of Christianity and penetrated more deeply than any contemporary thinker into the significance of Spinoza’s philosophy. He also found time for the studies which were ultimately to appear in the volume entitled Laokoon, and in fresh spring mornings he sketched in a garden the plan of Minna von Barnhelm.

After resigning his Breslau appointment in 1765, he hoped for a time to obtain a congenial appointment in Dresden, but nothing came of this and he was again compelled, much against his will, to return to Berlin. His friends there exerted themselves to obtain for him the office of keeper of the royal library, but Frederick had not forgotten Lessing’s quarrel with Voltaire, and declined to consider his claims. During the two years which Lessing now spent in the Prussian capital, he was restless and unhappy, yet it was during this period that he published two of his greatest works, Laokoon, oder über die Grenzen der Malerei und Poesie (1766) and Minna von Barnhelm (1767). The aim of Laokoon, which ranks as a classic, not only in German but in European literature, is to define by analysis the limitations of poetry and the plastic arts. Many of his conclusions have been corrected and extended by later criticism; but he indicated more decisively than any of his predecessors the fruitful principle that each art is subject to definite conditions, and that it can accomplish great results only by limiting itself to its special function. The most valuable parts of the work are those which relate to poetry, of which he had a much more intimate knowledge than of sculpture and painting. His exposition of the methods of Homer and Sophocles is especially suggestive, and he may be said to have marked an epoch in the appreciation of these writers, and of Greek literature generally. The power of Minna von Barnhelm, Lessing’s greatest drama, was also immediately recognized. Tellheim, the hero of the comedy, is an admirable study of a manly and sensitive soldier, with somewhat exaggerated ideas of conventional honour; and Minna, the heroine, is one of the brightest and most attractive figures in German
comedy. The subordinate characters are conceived with even more force and vividness; and the plot, which reflects precisely the struggles and aspirations of the period that immediately followed the Seven Years' War, is simply and naturally unfolded.

In 1767 Lessing settled in Hamburg, where he had been invited to take part in the establishment of a national theatre. The scheme promised well, and, as he associated himself with Johann Joachim Christoph Bode (1730–1793), a literary man whom he respected, in starting a printing establishment, he hoped that he might at last look forward to a peaceful and prosperous career. The theatre, however, was soon closed, and the printing establishment failed, leaving behind it a heavy burden of debt. In despair, Lessing determined towards the end of his residence in Hamburg to quit Germany, believing that in Italy he might find congenial labour that would suffice for his wants. The Historische Dramaturgie (1767–1768), Lessing's commentary on the performances of the National Theatre, is the first modern handbook of the dramatist's art. By his original interpretation of Aristotle's theory of tragedy, he delivered German dramatists from the yoke of the classic tragedy of France, and directed them to the Greek dramatists and to Shakespeare. Another result of Lessing's labours in Hamburg was the Antiquarische Briefe (1768), a series of masterly letters in answer to Christian Adolph Klotz (1738–1771), a professor of the university of Halle, who, after flattering Lessing, had attacked him, and sought to establish a kind of intellectual despotism by means of critical journals which he directly or indirectly controlled. In connexion with this controversy Lessing wrote his brilliant little treatise, Wie die Alten den Tod gebildet (1769), contrasting the medieval representation of death as a skeleton with the Greek conception of death as the twin-brother of sleep.

Instead of settling in Italy, as he intended, Lessing accepted in 1770 the office of librarian at Wolfenbüttel, a post which was offered to him by the hereditary prince of Brunswick. In this position he passed his remaining years. For a time he was not unhappy, but the debts which he had contracted in Hamburg weighed heavily on him, and he missed the society of his friends; his health, too, which had hitherto been excellent, gradually gave way. In 1775 he travelled for nine months in Italy with Prince Leopold of Brunswick, and in the following year he married Eva König, the widow of a Hamburg merchant, with whom he had been on terms of intimate friendship. But their happiness lasted only for a brief period; in 1778 she died in childbirth.

Soon after settling in Wolfenbüttel, Lessing found in the library the manuscript of a treatise by Berengarius of Tours on transubstantiation in reply to Lanfranc. This was the occasion of Lessing's powerful essay on Berengarius, in which he vindicated the latter's character as a serious and consistent thinker. In 1771 he published his Zerstörte Anmerkungen über das Epigramm, und einige der vornehmsten Epigrammatisier—a work which Herder described as "itself an epigram." Lessing's theory of the origin of the epigram is somewhat fanciful, but no other critic has offered so many pregnant hints as to the laws of epigrammatic verse, or defended with so much force and ingenuity the character of Martial. In 1772 he published Emilia Galotti, a tragedy which he had begun many years before in Leipzig. The subject was suggested by the Roman legend of Virginia, but the scene is laid in an Italian court, and the whole play is conceived in the spirit of the "tragedy of common life." Its defect is that its tragic conclusion does not seem absolutely inevitable, but the characters—especially those of the Gräfin Orsina and Marimeli, the prince of Guastalla's chamberlain who weaves the intrigue from which Emilia escapes by death, are powerfully drawn. Having completed Emilia Galotti, which the younger generation of playwrights at once accepted as a model, Lessing occupied himself for some years almost exclusively with the treasures of the Wolfenbüttel library. The results of these researches he embodied in a series of volumes, Zur Geschichte und Literatur, the first being issued in 1773, the last in the year of his death.

The last period of Lessing's life was devoted chiefly to theo-

logical controversy. H. S. Reimarus (1694–1768), professor of oriental languages in Hamburg, who commanded general respect as a scholar and thinker, wrote a book entitled Apologie oder Schulschrift für die vernünftigen Verehrer Gottes. His standpoint was that of the English deists, and he investigated, without hesitation, the evidence for the miracles recorded in the Bible. The manuscript of this work was, after the author's death, entrusted by his daughter to Lessing, who published extracts from it in his Zur Geschichte und Literatur in 1774–1778. These extracts, the authorship of which was not publicly avowed, were known as the Wolfenbüttler Fragmente. They created profound excitement among orthodox theologians, and evoked many replies, in which Lessing was bitterly condemned for having published writings of so dangerous a tendency. His most formidable assailant was Johann Melchior Goeze (1717–1756), the chief pastor of Hamburg, a sincere and earnest theologian, but utterly unscrupulous in his choice of weapons against an opponent. To him, therefore, Lessing addressed in 1778 his most elaborate answers—Eine Parabel, Axiomata, eleven letters with the title Anti-Goeze, and two pamphlets in reply to an inquiry by Goeze as to what Lessing meant by Christianity. These papers are not only full of thought and learning; they are written with a grace, vivacity and energy that make them hardly less interesting to-day than they were to Lessing's contemporaries. He does not undertake to defend the conclusions of Reimarus; his immediate object is to claim the right of free criticism in regard even to the highest subjects of human thought. The argument on which he chiefly relies is that the Bible cannot be considered necessary to a belief in Christianity, since Christianity was a living and conquering power before the New Testament in its present form was recognized by the church. The true evidence for what is essential in Christianity, he contends, is its adaptation to the wants of human nature; hence the religious spirit is undisturbed by the speculations of the boldest thinkers. The effect of this controversy was to secure wider freedom for writers on theology, and to suggest new problems regarding the growth of Christianity, the formation of the canon and the essence of religion. The Brunswick government having, in deference to the consistory, confiscated the Fragmente and ordered Lessing to discontinue the controversy, he resolved, as he wrote to Elise Reimarus, to try "whether they would let him preach undisturbed from his old pulpit, the stage." In Nathan der Weise, written in the winter of 1778–1779, he gave poetic form to the ideas which he had already developed in his theological controversy, that is, that good character may be associated with the most diverse vices, and that there can, therefore, be no good reason why the holders of one sect of religious principles should not tolerate those who maintain wholly different doctrines. The play, which is written in blank verse, is too obviously a continuation of Lessing's theological controversy to rank high as poetry, but the representatives of the three religions—the Mahomedan Saladin, the Jew Nathan and the Christian Knight Templar—are finely conceived, and show that Lessing's dramatic instinct had, in spite of other interests, not deserted him. In 1780 appeared Die Erzeugung des Menschen-geschlechts, the first half of which he had published in 1777 with one of the Fragmente. This work, composed a hundred brief paragraphs, was the last, and is one of the most suggestive of Lessing's writings. The doctrine on which its argument is based is that no dogmatic creed can be regarded as final, but that every historical religion had its share in the development of the spiritual life of mankind. Lessing also maintains that history reveals a definite law of progress, and that occasional retrogression may be necessary for the advance of the world towards its ultimate goal. These ideas formed a striking contrast to the principles both of orthodox and of sceptical writers in Lessing's day, and gave a wholly new direction to religious philosophy. Another work of Lessing's last years, Ernst und Falk (a series of five dialogues, of which the first three were published in 1777, the last two in 1780), also set forth many new points of view. Its nominal subject is freemasonry, but its real aim is to plead for a humane and charitable spirit in opposition to a narrow
patriotism, an extravagant respect for rank, and exclusive devotion to any particular church.

Lessing's theological opinions exposed him to much petty persecution, and he was in almost constant straits for money. Nothing, however, broke his manly and generous spirit. To the end he was always ready to help those who appealed to him for aid, and he devoted himself with growing ardour to the search for truth. He formed many new plans of work, but in the course of 1780 it became evident to his friends that he would not be able much longer to continue his labours. His health had been undermined by excessive work and anxiety, and after a short illness he died at Brunswick on the 15th of February 1781. "We lose much in him," wrote Goethe after Lessing's death, "more than we think." It may be questioned whether there is any other writer to whom the Germans owe a deeper debt of gratitude. He was succeeded by poets and philosophers who gave Germany for a time the first place in the intellectual life of the world, and it was Lessing, as they themselves acknowledged, who prepared the way for their achievements. Without attaching himself (as most partisans of G. E. Uhrauer, 1800, did) to the achievements of Lessing, he fought with infinite industry, and in regard to art, poetry and the drama and religion, suggested ideas which kindled the enthusiasm of aspiring minds, and stimulated their highest energies.

BIBLIOGRAPHY.—The first edition of Lessing's collected works, edited by his brother Karl Gottholf Lessing (1740-1812), J. J. Eschenburg and F. Nicolai, appeared in 26 vols. between 1791 and 1794, as a continuation of the Verzöge Schriften, edited by Lessing himself. In 1777-1785: the second edition, edited by Karl Lammach, was published in 13 vols. (1825-1828), this edition being subsequently re-edited by W. von Maltzahn (1853-1857) and by F. Münche (21 vols., 1886 ff.), the last mentioned being the standard edition of Lessing's works. Other editions were editions of Lessing's Vorder, published by Hempel, under the editorship of various scholars (23 vols., 1868-1877); an illustrated edition published by Grote in 8 vols. (1875, new ed., 1882); Lessing's Werke, edited by R. Boxberger and K. Cosack, 18 vols., 1896; and Lessings Holzknieh, 12 vols., 1890. There are also several popular editions. Lessing's correspondence is included in the Lammahn editions and in that of Hempel (edited by C. C. Redlich, 1879). Nachträäge und Beihefte, 1887, and Blumen und Früchte, 1889, are the chief biographies of Lessing by K. G. Lessing (his brother), (1793-1795, a reprint in Recul's Universalbibliothek); by J. F. Schef and G. E. Uhrauer (1849-1853, 2nd ed. by W. von Maltzahn and R. Boxberger, 2 vols., 1880-1881); A. Stahr (2 vols., 1859, 9th ed., 1887); J. Sime, Lessing, his Life and Works (2 vols., 1877); H. Zimmermann, Lessing's Life and Works, (2 vols., 1890); L. Lamm, Lessing, Geschichte seines Lebens und seiner Schriften (2 vols., 1888-1892, 3rd ed., 1910),—this is the most complete biography; T. W. Kolleston, Lessing in "Great Writings," (1888); K. Borinski, Lessing (2 vols., 1891-1892); H. Held,目录 Lessings Leben, 2 vols., 1902-1903; and H. Doehmann, Forsungen über Lessings Sprache (1875); H. C. Cosack, Materialien zu Lessings Hamburger Dramaturgie (1876, 2nd ed., 1894); H. Blümner, Lessings Laokoon (1876, 2nd ed., 1890); H. Blümner, Lessing-Studien (2 vols., 1891-1892); H. Fischer, Lessing als Reformer der deutschen Literatur dargestellt (2 vols., 1881, 2nd ed., 1888); B. A. Wagner, Lessing-Forschungen (1881); J. W. Braun, Lessing im Urteil seiner Zeitgenossen (2 vols., 1894); P. Ahrbrecht, Lessings Plagiate (6 vols., 1890); K. Zimmern, Forsungen über Lessings Nathan (1892); Kettner, Lessings Dramen im Lichte ihrer und unserer Zeit (1904). Translations of Lessing's Dramatic Works (2 vols., 1878), edited by E. Bell, and of Laokoon, Dramatische Werke und die Reprezentation der Dichtung mit dem Leben der E. C. Beasley and H. Zimmermann (1 vol., 1879), will be found in Bohn's "Standard Library." (J. S.I.; J. G. R.)

LESSON (through Fr. legon from Lat. lectio, reading; legere, to read, properly a certain portion of a book appointed to be read aloud, or learnt for repetition, hence anything learnt or studied, a course of instruction or study. A specific meaning of the word is that of a portion of Scripture or other religious writings appointed to be read at divine service, in accordance with a table known as a "lectionary." In the Church of England the lectionary is so ordered that most of the Old Testament is read through during the year as the First Lesson at Morning and Evening Prayer, and as the Second Lesson the whole of the New Testament, except Revelation, of which only portions are read. (See LECTIO and LECTIONARY.)

LESTE, a desert wind, similar to the Leveche (q.v.), observed in Madeira. It blows from an easterly direction in autumn, winter and spring, rarely in summer, and is of intense dryness, sometimes reducing the relative humidity at Funchal to below 20%. The Leste is commonly accompanied by clouds of fine red sand.

L'ESTRANGE, SIR ROGER (1661-1704), English pamphleteer on the royalist and court side during the Restoration epoch, but principally remarkable as the first English man of letters of any distinction who made journalism a profession, was born at Hunsanton in Norfolk on the 17th of December 1661. In 1644, during the civil war, he headed a conspiracy to seize the town of Lynn for the king, under circumstances which led to his being condemned to death as a spy. The sentence, however, was not executed, and after four years' imprisonment in Newgate he escaped to the Continent. He was excluded from the Act of Indemnity, but in 1653 was pardoned by Cromwell upon his personal solicitation, and lived quietly until the Restoration, when after some delay his services and sufferings were acknowledged by his appointment as licenser of the press. This office was administered by him in the spirit which might be expected from a zealous cavalier. He made himself notorious, not merely for the severity of his literary censorship, but by his vigilance in the suppression of clandestine printing. In 1663 (see Newspapers) he commenced the publication of the Public Intelligence and the News, from which eventually developed the famous official paper the London Gazette in 1665. In 1679 he again became prominent with the Observer, a journal specially designed to vindicate the court from the charge of a secret inclination to popery. He discredited the Popish Plot, and the suspicion he thus incurred was increased by the conversion of his daughter to Roman Catholicism, but there seems no reason to question the sincerity of his own attachment to the Church of England. In 1687 he gave a further proof of independence by discontinuing the Observer from his unwillingness to advocate James II's Edict of Toleration, although he had previously gone all lengths in support of the measures of the court. The Revolution cost him his office as licenser, and the remainder of his life was spent in obscurity. He died in 1704. It is to L'Estrange's credit that among the agitations of a busy political life he should have found time for much purely literary work as a translator of Josephus, Cicero, Seneca, Quevedo and other standard authors.

LESUEUR, DANIEL, the pseudonym of JEANNE LAPANZÉ, née Loiseau (1680—1750), French poet and novelist, who was born in Paris in 1680. She published a volume of poems, Fleurs d'ovril (1682), which was crowned by the Academy. She also wrote some powerful novels dealing with contemporary life: Le Mariage de Gabrielle (1882); Un Mysterieux Amour (1802), with a series of philosophical sonnets; L'Amant de Geneviève (1883); Marcelle (1883); Une Vie tragique (1990); Justice de femme (1893); Comédie Haine d'amour (1894); Humeur d'une femme (1901); La Force du passé (1905). Her poems were collected in 1895. She published in 1905 a book on the economic status of women, L'Evolution feminine; and in 1905-1905 a translation (2 vols.) of the works of Flora, the famous Roman poet, which was awarded a prize by the Academy. Her Masque d'amour, a five-act play based on her novel (1904) of the same name, was produced at the Théâtre Sarah Bernhardt in 1905. She received the ribbon of the Legion of Honour in 1900, and the prix Yvet from the French Academy in 1905. She married in 1904 Henry Lapanne (b. 1867), a well-known writer on art.

LE SUEUR, EUSTACHE (1617-1655), one of the founders of the French Academy of painting, was born on the 19th of November 1617 at Paris, where he passed his whole life, and where he died on the 30th of April 1655. His early death and retired habits have combined to give an air of romance to his simple history, which has been decorated with as many fables as that of Claude. We are told that, persecuted by Le Brun, who was jealous of his ability, he became the intimate friend and correspondent of Poussin, and it is added, broken-hearted at the death of his wife, Le Sueur retired to the monastery of the Chartreux and died in the arms of the prior. All this, however, is pure fiction. The facts of Le Sueur's life are these. He was
LESUEUR, JEAN FRANÇOIS (1760 or 1763-1837), French musical composer, was born on the 15th of January 1760 (or 1763) at Drucat-Plessis, near Abbeville. He was a choir boy in the cathedral of Amiens, and then became musical director at various churches. In 1786 he obtained by open competition the musical directorship of the cathedral of Notre-Dame in Paris, where he gave successful performances of sacred music with a full orchestra. This place he retained for twenty years, and after a retirement of five years in a friend's country house, he produced La Caverne and two other operas at the Théatre Feydeau in Paris. At the foundation of the Paris Conservatoire (1795) Lesueur was appointed one of its inspectors of studies, but was dismissed in 1802, owing to his disagreements with Mihul. Lesueur succeeded G. Paisiello as Maestro di cappella to Napoleon, and produced (1804) his Ossian at the Opéra. He also composed for the emperor's coronation a mass and a Te Deum. Louis XVIII, who had retained Lesueur in his court, appointed him (1818) professor of composition at the Conservatoire; and at this institution he had, among many other pupils, Hector Berlioz, Ambrose Thomas, Louis Désiré, Besozzi and Charles Gounod. He died on the 6th of October 1875. Lesueur composed eight operas and several masses, and other sacred music. All his works are written in a style of rigorous simplicity.

LE TELLIER, MICHEL (1602-1685), French statesman, was born in Paris on the 19th of April 1603. Having entered the public service he became maître des requêtes and in 1640 intendant of Piedmont; in 1643, owing to his friendship with Mazarin, he became secretary of state for military affairs, being an efficient administrator. In 1657 he was made chancellor of France and he was one of those who influenced Louis XIV. to revoke the Edict of Nantes. He died on the 30th of October 1685, a few days after the revolution had been signed. Le Tellier, who amassed great wealth, left two sons, one the famous statesman Louise's and another who became archbishop of Reims. His correspondence is in the Bibliothèque nationale in Paris.

See L. Caron, Michel Le Tellier, intendant d'armée au Piémont (Paris, 1881).

Another Michel Le TELLIER (1643-1719) was confessor of the French king Louis XIV. Born at Vire on the 16th of December, 1643 he entered the Society of Jesus and later became prominent in consequence of his violent attacks on the Jansenists. He was appointed provincial of his order in France, but it was not until 1709 that he became the king's confessor. In this capacity all his influence was directed towards urging Louis to further persecutions of the Protestants. He was exiled by the regent Orleans, but he had returned to France when he died at La Flèche on the 2nd of September 1716.

LETHAL (Lat. lethalis, from lethalis, deadly, from letum, death; the spelling is due to a confusion with Gr. μάθης, forgetfulness), an adjective meaning "deadly," "fatal," especially as applied to weapons, drugs, &c. A "lethal chamber" is a room or receptacle in which animals may be put to death painlessly, by the admission of poisonous gases.

LETHARY (Gr. λεθαργία, from λήθη, forgetfulness), drowsiness, torpor. In pathology the term is used of a morbid condition of deep and lasting sleep from which the sufferer can be with difficulty and only temporarily aroused. The term Negro or African lethargy was formerly applied to the disease now generally known as "sleeping sickness" (q.v.).

LÈTHE ("Oblivion"), in Greek mythology, the daughter of Eris (Hesiod, Theog. 27) and the personification of forgetfulness. It is also the name of a river in the infernal regions. Those initiated in the mysteries were taught to distinguish two streams in the lower world, one of memory and one of oblivion. Directions for this purpose, written on a gold plate, have been found in a tomb at Petelia, and near Lebadeia, at the oracle of Trophonius, which was counted an entrance to the lower world, the two springs Menosyne and Lèthe were shown (Pausanias ix. 30. 8). This thought begins to appear in literature in the end of the 5th century B.C., when Aristophanes (Fros, 186) speaks of the plain of Lèthe. Plato (Rep. x.) embodies the idea in one of his finest myths.

LE TRÉPORT, a maritime town of northern France in the department of Seine-Inferieure, on the English Channel, at the mouth of the Brese, 114 m. N.N.W. of Paris on the northern railway. Pop. (1906) 4691. Owing to its nearness to the capital, Le Tréport is a favourite watering-place of the Parisians. A good view is obtained from Mont Huon, which rises to the south-west of the town. The mouth of the Brese forms a small port, comprising an outer tidal harbour and an inner dock accessible to vessels drawing from 13 to 16 ft. The fisheries and oyster parks with their dependent industries, shipbuilding and glass manufacture, furnish the chief occupations of the inhabitants. Coal, timber, ice and jute are imported; articles of Paris, sugar, &c., are exported. The chief buildings are the church of St Jacques (16th century), which has finely carved vaulting and good modern stained glass, and the casino erected 1869-1897. About 1 m. north-east of Le Tréport is the small bathing resort of Mers. The Eu-Tréport canal, uniting the two towns, has a length of about 3 m., and is navigable by vessels drawing 14 ft. Le Tréport (the ancient Ullterior Portus) was a port of some note in the middle ages and suffered from the English invasions. Louis Philippe twice received Queen Victoria here.

LETRONNE, JEAN ANTOINE (1787-1848), French archaeologist, was born at Paris on the 25th of January 1875. His
father, a poor engraver, sent him to study art under the painter David, but his own tastes were literary, and he became a student in the Collège de France, where it is said he used to exercise his already strongly developed critical faculty by correcting for his own amusement old and bad texts of Greek authors, a centre for comparing the results with the latest and most approved editions. From 1810 to 1812 he travelled in France, Switzerland and Italy, and on his return to Paris published an Essai critique sur la toponomie de Syracuse (1812), designed to elucidate Thucy- dides. Two years later appeared his Recherches géographiques et critiques sur le De Mensura Orbis Terrae of Dicuil. In 1815 he was commissioned by government to complete the translation of Strabo which had begun by Laporte-Duthel, and in March 1816 he was one of those who were admitted to the Academy of Inscriptions by royal ordinance, having previously contributed a Mémoire, “On the Methamatical System of the Egyptians,” which had been crowned. Further promotion came rapidly; in 1817 he was appointed director of the École des Chartes, in 1819 inspector-general of the university, and in 1831 professor of history in the Collège de France. This chair he exchanged in 1838 for that of archaology, and in 1840 he succeeded Pierre C. François Daunou (1761–1840) as keeper of the national archives. Meanwhile he had published, among other works, Considerations générales sur l’évaluation des monnaies grecques et romaines et sur les inscriptions de l’alphabet grec, with a view to the restoration of the ancient symbols (1817). Recherches pour servir à l’histoire de l’Egypte pendant la domination des Grecs et des Romains (1823), and Sur l’origine grecque des zodiacs prétendus égyptiens (1837). By the last-named he finally exploded a fallacy which had up to that time viti®ed the chronology of contemporary Egyptologists. His Diplômes et chartes de l’époque Mérovingienne sur papyrus et sur toile were published in 1844. The most important work of Letronne is the Recueil des inscriptions grecques et latines de l’Egypte, of which the first volume appeared in 1842, and the second in 1848. He died at Paris on the 14th of December 1848.

Letter (through Fr. lettre from Lat. littera or litera, letter of the alphabet; the origin of the Latin word is obscure; it has probably no connexion with the root of lincre, to smear, i.e. with wax, for an inscription with a stilus), a character or symbol expressing any one of the elementary sounds into which a spoken word may be analysed, one of the members of an alphabet. As applied to things written, the word follows mainly the meanings of the Latin plural litterae, the most common meaning attaching to the word being that of a written communication from one person to another. For the means adopted to secure the transmission of letters see Post and Postal Service.

The word is also, particularly in the plural, applied to many legal and formal written documents, as in letters patent, letters rogatory and dismemmancy, &c. The Latin use of the plural is also followed in the employment of “letters” in the sense of literature (q.v.) or learning.

LETTERKENNY, a market town of Co. Donegal, Ireland, 23 m. W. by S. of Londonderry by the Londonderry and Lough Swilly and Letterkenny railway. Pop. (1901) 2370. It has a harbour at Port Ballyrane, 1 m. distant on Lough Swilly. In the market square a considerable trade in grain, flax and provisions is prosecuted. Rope-making and shirt-making are industries. The handsome Roman Catholic cathedral for the diocese of Raphoe occupies a commanding site, and cost a large sum, as it contains carving from Rome, glass from Munich and a pulpit of Irish and Carrarra marble. It was consecrated in 1901.

There is a Catholic college dedicated to St. Eunan. The town, which is governed by an urban district council, is a centre of gaol and post office. Its name signifies the “hill of the O’Cannans,” a family who lorded over Tyrconnell before the rise of the O’Donnells.

LETTER OF CREDIT, a letter, open or sealed, from a banker or merchant, containing a request to some other person or firm to advance the bearer of the letter, or some other person named therein, upon the credit of the writer a particular or an unlimited sum of money. A letter of credit is either general or special. It is general when addressed to merchants or other persons in general, requesting an advance to a third person, and special when addressed to a particular person by name requesting him to make such an advance. A letter of credit is not a negotiable instrument. When a letter of credit is given for the purchase of goods, the letter of credit usually states the particulars of the merchandise against which bills are to be drawn, and shipping documents (bills of lading, invoices, insurance policies) are usually attached to the draft for acceptance.

LETTERS PATENT. It is a rule alike of common law and sound policy that grants of freehold interests, franchises, liberties, &c., by the sovereign to a subject should be made only after due consideration, and in a form readily accessible to the public. These ends are attained in England through the agency of that piece of constitutional machinery known as “letters patent.” It is here proposed to consider only the characteristics of letters patent generally. The law relating to letters patent for inventions is dealt with under the heading PATENTS.

Letters patent (litterae patentes) are letters addressed by the sovereign to all to whom these presents shall come, reciting the grant of some dignity, office, monopoly, franchise or other privilege to the patentee. They are not sealed up, but are left open (hence the term “patent”), and are recorded in the Patent Rolls in the Record Office, or in the case of very recent grants, in the Chancery Enrollments Office, so that all successors of the realm may read and be bound by their contents. In this respect they differ from certain other letters of the sovereign directed to particular persons and for particular purposes, which, not being proper for public inspection, are closed up and sealed on the outside, and are thereupon called writs close (litterae clauses) and are recorded in the Close Rolls. Letters patent are used to put into commission various powers inherent in the crown—legislative powers, as when the sovereign entrusts to others the duty of opening parliament or assenting to bills; judicial powers, e.g. of gaol delivery; executive powers, as when the duties of Treasurer and Lord High Admiral are assigned to commissioners of the Treasury and Admiralty (Anson, Const. ii. 47). Letters patent are also used to incorporate bodies by charter—in the British colonies, this mode of legislation is frequently applied to joint stock companies (cf. Rev. Stats. Ontario, c. 191, s. 9)—to grant a congé d’être to a dean and chapter to elect a bishop, or licence to convocation to amend canons; to grant pardon, and to confer certain offices and dignities. Among grants of offices, &c., made by letters patent the following may be enumerated. The benefices of prelates and bishops, the baronet and knight bachelor; the appointments of lord-lieutenant, customs rotulorum of counties, judge of the High Court and Indian and Colonial judgements, king’s counsel, crown livings; the offices of attorney- and solicitor-general, command-in-chief, master of the horse, keeper of the privy seal, postmaster-general, king’s printer; grants of separate courts of quarter-sessions. The fees payable in respect of the grant of various forms of letters patent are fixed by orders of the lord chancellor, dated 20th of June 1871, 18th of July 1871 and 17th of Aug. 1881. (These orders are set out at length in the Statutory Rules and Orders Revised (ed. 1904), vol. ii. tit. “Clerk of the Crown in Chancery,” pp. i. et seq.) Formerly each colonial governor was appointed and commissioned by letters patent under the great seal of the United Kingdom. But since 1875, the practice has been to create the office of governor in each colony by letters patent, and then to make each appointment to the office by commission under the Royal Sign Manual and to give to the governor commissions or special letters under the Royal Sign Manual. The letters patent, commission and instructions, are commonly described as the Governor’s Commission (see Jenkyns, British Rule and Jurisdiction beyond the Seas, p. 100; the forms now in use are printed in Appx. iv. Also the Statutory Rules and Codes Revised, ed. 1904, under the title of the colony to which they relate). The Colonial Letters Patent Act 1863 provides that letters patent shall not take effect in the colonies or possessions beyond the seas until their publication there by proclamation or otherwise (s. 2), and shall
be void unless so published within nine months in the case of colonies east of Bengal or west of Cape Horn, and within six months in any other case. Colonial officers and judges holding offices by patent for life or for a term certain, are removable by a special procedure—"amotion"—by the Governor and Council, subject to a right of appeal to the king in Council (Leave of Absence Act, formerly cited as "Burke's Act" 1782; see Montagu v. Governor of Van Diemen's Land, 1849, 6 Moo. P.C. 401; Willis v. Gipps, 1846, 6 St. Trials [N.S., 311]). The law of conquered or ceded colonies may be altered by the crown by letters patent under the Great Seal as well as by Proclamation or Order in Council (Jephson v. Riera, 1835, 3 Knapp, 130; 3 St. Trials [N.S.] 591).

Procedure.—Formerly letters patent were always granted under the Great Seal. But now, under the Crown Office Act 1877, and the Orders in Council made under it, many letters patent are sealed with the wafer seal. Letters patent for inventions are issued under the seal of the Patent Office. The procedure by which letters patent are obtained is as follows: A warrant for the issue of letters patent is drawn up, and is signed by the lord chancellor; this is submitted to the law officers of the Crown, who countersign it; finally, the warrant thus signed and countersigned is submitted to His Majesty, who affixes his signature. The warrant is then sent to the Crown Office and is filed, after it has been acted upon by the issue of letters patent under the great or under the wafer seal as the case may be. The letters patent are then delivered into the custody of those in whose favour they are granted.

Construction.—The construction of letters patent differs from that of other grants in certain particulars: (i.) Letters patent, contrary to the ordinary rule, are construed in a sense favourable to the grantor (viz., the crown) rather than to the grantee; although this rule is said not to apply so strictly where the grant is made for consideration, or where it purports to be made ex cœrdi scientiæ et mero motu. (ii.) When it appears from the face of the grant that the sovereign has been mistaken or deceived, either in matter of fact or in matter of law, as, e.g., by false suggestion on the part of the patentee, or by misrepresentation of former grants, or if the grant is contrary to law or uncertain, the letters patent are absolutely void, and may still, it would seem, be cancelled, or rescinded as regards letters patent for inventions, which are revoked by a special procedure, regulated by § 26 of the Patents Act 1883, by the procedure known as scire facias, an action brought against the patentee in the name of the crown with the fiat of the attorney-general.

As to letters patent generally, see Bacon's Abridgment ('Prerogative,' F.); Chitty's Prerogative; Hindmarsh on Patents (1846); Anson, Law and Custom of the Const. ii. (3rd ed., Oxford and London, 1907–1908).

**LETTRES DE CACHET.** Considered solely as French documents, lettres de cachet may be defined as letters signed by the king of France, countersigned by one of his ministers, and closed with the royal seal (cachet). They contained an order—in principle, any order whatsoever—emanating directly from the king, and executory by himself. In the case of organized bodies lettres de cachet were issued for the purpose of enroling members to assemble or to accomplish some definite act; the provincial estates were convoked in this manner, and it was by a lettre de cachet (called lettre de jure vacant) that the king ordered a parliament to register a law in the teeth of its own remonstrances. The best-known lettres de cachet, however, were those which may be called penal, by which the king sentenced a subject without trial and without an opportunity of defence to imprisonment in a state prison or an ordinary gaol, confinement in a convent or a hospital, transportation to the colonies, or relegation to a given place within the realm.

The power which the king exercised on these various occasions was a royal privilege recognized by old French law, and can be traced to a maxim which furnished a text of the Digest of Justinian: "Rex solutus est legibus." This signified particularly that when the king intervened directly in the administration proper, or in the administration of justice, by a special act of his will, he could decide without the laws, and even in a sense contrary to the laws. This was an early conception, and in early times the order in question was simply verbal; then, some letters patent of Henry III. of France in 1576 (Isambert, Anciennes lois françaises, xiv. 278) state that François de Monmorency was "prisoner in our castle of the Bastille in Paris by verbal command" of the late king Charles IX. But in the 14th century the principle was introduced that the order should be written, and hence arose the lettre de cachet. The lettre de cachet was contrary to the laws, as opposed to lettres patentes, which contained the expression of the legal and permanent will of the king, and had to be furnished with the seal of state affixed by the chancellor. The lettres de cachet, on the contrary, were signed simply by a secretary of state (formerly known as secrétaire des commandements) for the king; they bore merely the imprint of the king's privy seal, from which circumstance they were often called, in the 14th and 15th centuries, lettres de petit signet or lettres de petit cachet, and were entirely exempt from the control of the chancellor.

While serving the government as a silent weapon against political adversaries or dangerous writers and as a means of intimidating those who were in the act of bringing suit in a court of law, the lettres de cachet had many other uses. They were employed by the police in dealing with prostitutes, and on their authority lunatics were shut up in hospitals and sometimes in prisons. They were also often used by heads of families as a means of correction, e.g., for protecting the family honour from the disorderly or criminal conduct of sons; wives, too, took advantage of them to curb the profligacy of husbands and vice versa. They were issued by the intermediary on the advice of the intendants in the provinces and of the lieutenant of police in Paris. In reality, the secretary of state issued them in a completely arbitrary fashion, and in most cases the king was unaware of their issue. In the 18th century it is certain that the letters were often issued blank, i.e., without containing the name of the person against whom they were directed; the recipient, or mandatory, filled in the name in order to make the letter effective.

Protests against the lettres de cachet were made continually by the parlement of Paris and by the provincial parlements, and often also by the States-General. In 1648 the sovereign courts of Paris procured their momentary suppression in a kind of charter of liberties which they imposed upon the crown, but which was ephemeral. It was not until the reign of Louis XVI. that a reaction against this abuse became clearly perceptible. At the beginning of that reign Malesherbes during his short ministry endeavoured to abuse some measure of justice into the system, and in March 1784 the baron de Breteuil, a minister of the king's household, addressed a circular to the intendants and the lieutenant of police with a view to preventing the crying abuses connected with the issue of lettres de cachet. In Paris, in 1779, the Cour des Aides demanded their suppression, and in March 1788 the parlement of Paris made some exceedingly energetic remonstrances, which are important for the light they throw upon old French public law. The crown, however, did not decide to lay aside this weapon, and in a declaration to the States-General in the royal session of the 23rd of June 1789 (art. 142) it would not renounce it absolutely. Lettres de cachet were abolished by the Constituent Assembly, but Napoleon restored them and made them the equivalent of a political measure in the decree of the 9th of March 1801 on the state prisons. This was one of the acts brought up against him by the sénatus-consulte of the 3rd of April 1814, which pronounced his fall "considering that he has violated the constitutional laws by the decrees on the state prisons."

See Honoré Mirabeau, Les Lettres de cachet et des prisons d'état (Hamburg, 1782), written in the dungeon at Vincennes into which his father had thrown him by a lettre de cachet, one of the ablest and most eloquent of his works, which had an immense circulation and was translated into English with a dedication to the duke of Norfolk in 1788; Frantz Funck-Brentano, Les Lettres de cachet à Paris (Paris, 1904); and André Chassaigne, Les Lettres de cachet sous l'ancien régime (Paris, 1903).
LETTUCE, known botanically as Lactuca sativa (nat. ord. Compositae), a hardy annual, highly esteemed as a salad plant. The London market-gardeners make preparation for the first main crop of Cos lettuces in the open ground early in August, a frame being set on a shallow hotbed, and, the stimulus of heat not being required, this is allowed to subside till the first week in October, when the soil, consisting of leaf-mould mixed with a little sand, is put on 6 or 7 in. thick, so that the surface is within 4½ in. of the sashes. The best time for sowing is found to be about the 11th of October, one of the best varieties being Lobjoets Green Cos. When the seeds begin to germinate the sashes are drawn quite off in favourable weather during the day, and put on, but tilted, at night in wet weather. Very little watering is required, and the aim should be to keep the plants gently moving till the days begin to lengthen. In January a more active growth is encouraged, and in mild winters a considerable extent of the planting out is done, but in private gardens the preferable time would be February. The ground should be light and rich, and well manured below, and the plants put out at 1 ft. apart each way with the dibble. Frequent stirring of the ground with the hoe greatly encourages the growth of the plants. A second sowing should be made about the 5th of November, and a third in frames about the end of January or beginning of February. In March a sowing may be made in some warm situation out of doors; successional sowings may be made in the open border about every third or fourth week till August, about the middle of which month a crop of Brown Cos, Hardy Hammersmith or Hardy White Cos should be sown, the latter being the most reliable in a severe winter. These plants may be put out early in October on the sides of ridges facing the south or at the front of a south wall, beyond the reach of drops from the copings, being planted 6 or 8 in. apart. Young lettuce plants should be thinned out in the seed-beds before they crowd or draw each other, and transplanted as soon as possible after two weeks, the cultivators prefer that the summer crops should not be transplanted, but sown where they are to stand, the plants being merely thinned out; but transplanting checks the running to seed, and makes the most of the ground.

For a winter supply by gentle forcing, the Hardy Hammersmith and Brown Dutch Cabbage lettuces, and the Brown Cos and Green Paris Cos lettuces, should be sown about the middle of August, and in the beginning of September, in rich light soil, the plants being pricked out 3 in. apart in a prepared bed, as soon as the first two leaves are fully formed. About the middle of October the plants should be taken up carefully with balls attached to the roots, and should be placed in a mild hotbed of well-prepared dung (about 55°) covered about 1 ft. deep with a compost of sandy peat, leaf-mould and a little well-decomposed manure. The Cos and Brown Dutch varieties should be planted about 1 foot apart; over-planting in the warm weather and protecting from frost. For winter work Stanstead Park Cabbage Lettuce is greatly favoured now by London market-gardeners, as it stands the winter well. Lee's Immense is another good variety, while All the Year Round may be sown for almost any season, but is better perhaps for summer crops.

There are two races of the lettuce, the Cos lettuce, with erect oblong heads, and the Cabbage lettuce, with round or spreading heads,—the former generally crisp, the latter soft and flabby in texture. Some of the best lettuces for general purposes of the two classes are the following:—

Cos: White Paris Cos, best for summer; Green Paris Cos, harder than the white; Brown Cos, Lobjoets Green Cos, one of the hardest and best for winter; Hardy White Cos.

Cabbage: Hammersmith Hardy Green; Stanstead Park, very hardy, good for winter; Tom Thumb; Brown Dutch; Neapolitan, best for summer; All the Year Rouzd; Golden Ball, good for forcing in private establishments.

Lactuca virosa, the strong-scented lettuce, contains an alkaloid which has the power of dilating the pupil and may possibly be identical with hyoscyamine, though this point is as yet not determined. No variety of lettuce is now used for any medicinal purpose, though there is probably some slight foundation for the belief that the lettuce has faint narcotic properties.

LEUCADIA, the ancient name of one of the Ionian Islands, now Santa Maura (q.v.), and of its chief town (Hamaxich). LEUCIPPS, Greek philosopher, born at Miletus (or Eleus), founder of the Atomistic theory, contemporary of Zeno, Empedocles and Anaxagoras. His fame was so completely overshadowed by that of Democritus, who subsequently developed the theory into a system, that his very existence was denied by Epicurus (Diog. Laërt. x. 7), followed in modern times by E. Rohde. Epicurus, however, distinguishes Leucippus from Democritus, and Aristotle and Theophrastus expressly credit him with the invention of Atomism. There seems, therefore, no reason to doubt his existence, although nothing is known of his life, and even his birthplace is uncertain. Between Leucippus and Democritus there is an interval of at least forty years; accordingly, while the beginnings of Atomism are closely connected with the doctrines of the Eleatics, the system as developed by Democritus is conditioned by the sophistical views of his time, especially those of Protagoras. While Leucippus's notion of Being agreed generally with that of the Eleatics, he postulated its plurality (atoms) and motion, and the reality of not-Being (the void) in which his atoms moved.

See DEMOCRITUS. On the Rohde-Diels controversy as to the existence of Leucippus, see F. Lortzing in Bursian's Jahresbericht, vol. xxi. (1881); also J. Burnet, Early Greek Philosophy (1892).

LEUCITE, a rock consisting of potassium and aluminium metasilicate $\text{K}_2\text{SiO}_4$. Crystals have the form of cubic $\text{K}_2\text{Si}_2\text{O}_7$. Some of these are pseudo-cubic. Goniometric measurements made by G. von Raths in 1873 led him to refer the crystals to the tetragonal system, the faces of being distinct from those lettered i in the adjoining figure. Optical investigations have since proved the crystals to be still more complex in character, and to consist of several orthorhombic or monoclinic individuals, which are optically biaxial and repeatedly twinned, giving rise to twin-lamellae and striations on the faces. When the crystals are raised to a temperature of about 500° C. they become optically isotropic, but the twin-lamellae and striations disappearing, reappearing, however, when the crystals are again cooled. This pseudo-cubic character of leucite is exactly the same as that of the mineral boracite (q.v.).

The crystals are white (hence the name suggested by A. G. Werner in 1791, from λευκός) or ash-grey in colour, and are usually dull and opaque, but sometimes transparent and glassy; they are brittle and break with a conchoidal fracture. The hardness is 5-5, and the specific gravity 2-5. Enclosures of other minerals, arranged in concentric zones, are frequently present in the crystals. On account of the colour and form of the crystals the mineral was early known as "white garnet." French authors employ R. J. Haüy's name "amphigen." (L. J. S.)

Leucite Rocks.—Although rocks containing leucite are numerically scarcer than those containing being entirely without them, yet they are of wide distribution, occurring in every quarter of the globe. Taken collectively, they exhibit a considerable variety of types and are of great interest petrographically. For the presence of this mineral it is necessary that the silica percentage of the rock should not be high, for leucite never occurs in presence of quartz. It is most common in lavas of recent and Tertiary age, which have a fair amount of potash, or at any rate have potash equal to or greater alkalina; if soda and potash are equal, leucite is rarely formed. In pre-Tertiary rocks leucite is uncommon, since it readily decomposes and changes to zeolites, analcite, and other secondary minerals. Leucite also is rare in plutonic rocks and dike rocks, but leucite-schist and leucite-tuff are seen to bear witness to the possibility that it may occur in this manner. The rounded shape of its crystals, their white or grey colour, and rough cleavage, make the presence of leucite easily determinable in many of these rocks by simple inspection, especially when the crystals are large. "Pseudo-leucites" are rounded areas consisting of felspar, nepheline, analcite,
LEUCTRA—

which appears extending from the ground such a death change in the character of other minerals. Leucite is very often accompanied by nepheline, sodalite or nosean; other minerals which make their appearance with some frequency are melilite, garnet and molybdenite.

Monte Sepolcro, near the town of Rome, is rich in this mineral, which occurs in many small rounded crystals of leucite. Bracciano and Roccamonfina are other Italian localities for leucite, and in Java, Montana, Sardinia, and the present spot in Bohemia, leucite-syenites belong to more basic types and are rich in olivine and augite. They occur in great numbers in the Rhenish volcanic district (Eifel, Laacher See) and in Bohemia, and accompany nepheline and leucite-syenites in the igneous rocks of the town of Rome is a leucite tuff.

LEUCRA, a village of Boeotia in the territory of Thespiae, chiefly noticeable for the battle fought in its neighbourhood in 371 B.C. between the Thebans and the Spartans and their allies. A Peloponnesian army, about 10,000 strong, which had invaded Boeotia from Phocis, was here confronted by a Boeotian levy of perhaps 6000 soldiers under Epaminondas (q.v.). In spite of inferior numbers and the doubtful loyalty of his Boeotian allies, Epaminondas offered battle on the plain before the town. Massing his cavalry and the 50 deep column of Theban infantry on his left wing, he sent forward this body in advance of his centre and right wing. After a cavalry engagement in which the Thebans drove their enemies off the field, the decisive issue was fought out between the Theban and Spartan foot. The latter, though fighting well, could not sustain in their 12 deep formation against the heavy impact of their opponents' column, and were hurled back with a loss of about 2000 men, of whom 700 were Spartan citizens, including the king Cleombrotus. Seeing their right wing beaten, the rest of the Peloponnesians retired and left the enemy in possession of the field. Owing to the arrival of a Thessalian army under Jason of Phereia, whose friendship they did not trust, the Thebans were unable to exploit their victory. But the battle is none the less of great significance in Greek history. It marks a revolution in military tactics, affording the first known instance of a deliberate concentration of attack upon the vital point of the enemy's line. Its political effects were equally far-reaching, for the loss in material strength and prestige which the Spartans here sustained deprived them for ever of their supremacy in Greece.

LEUK (Fr. Loclé Ville), an ancient and very picturesque little town in the Swiss canton of the Valais. It is built above the right bank of the Rhone, and is about 1 m. from the Leuk station on the main line of the Simplon railway. In 1900 it had 1592 inhabitants, all but wholly German-speaking and Romanists. About 15 m. by a winding carriage road N. of Leuk, and near the head of the Dala valley, at a height of 4629 ft. above the sea-level, and overshadowed by the cliffs of the Gemini Pass (7641 ft.; g.v.) leading over to the Bernese Oberland, are the Baths of Leuk (Leukbad, or Loclé les Bains). They have only 613 permanent inhabitants, but are much frequented in summer by visitors (largely French and Swiss) attracted by the hot mineral springs. These are 22 in number, and are very abundant. The principal is that of St. Laurent, the water of which has a temperature of 124°F. The season lasts from June to September. The village in winter is long deprived of sunshine, and is much exposed to avalanches, by which it was destroyed in 1518, 1719 and 1756, but it is now protected by a strong embankment from a similar catastrophe.

(W. A. B. C.)

LEUTEN, a village of Prussian Silesia, 10 m. W. of Breslau, memorable as the scene of Frederick the Great's victory over the Austrians on December 5, 1757.

The high road from Breslau to Lüben crosses the marshy Schweditz Water at Lissa, and immediately enters the rolling country about Neumarkt.
Leuthe itself stands some 4000 paces south of the road, and a similar distance south again lies Sagschütz, while Nypem, on the northern edge of the hill country, is 5000 paces from the road. On Frederick's approach the Austrians took up a line of battle resting on the two last-named villages. Their whole position was strongly garrisoned and protected by obstacles, and their artillery was numerous though of light calibre. A strong outpost of Saxon cavalry was in Borne to the westward. Frederick had the previous day surprised the Austrian bakers at Neumarkt, and his Prussians, 33,000 to the enemy's 82,000, moved towards Borne and Leuthe early on the 5th. The Saxon outpost was rushed at in the morning mist, and, covered by their advanced guard on the heights beyond, the Prussians wheeled to their right. Prince Charles of Lorraine, the Austrian commander-in-chief, on Leuthe Church tower, could make nothing of Frederick's movements, and the commander of his right wing (Luchesi) sent him a message after message from Nypem and Gockleritz asking for help, which was eventually dispatched. But the real blow was to fall on the left under Nadasly. While the Austrian commander was thus wasting time, the Prussians were marching against Nadasly in two columns, which preserved their distances with an exactitude which has excited the wonder of modern generations of soldiers; at the due place they wheeled into line of battle obliquely to the Austrian front, and in one great échelon—the cavalry of the right wing foremost, and that of the left "refused."—Frederick advanced on Sagschütz. Nadasly, surprised, put a bold face on the matter and made a good defence, but he was speedily routed, and, as the Prussians advanced, battalion after battalion was rolled up towards Leuthe until the Austrians faced almost due south. The fighting in Leuthe itself was furious; the Austrians stood, in places, 100 deep, but the disciplined valour of the Prussians carried the village. For a moment the victory was endangered when Luchesi came down upon the Prussian left wing from the north, but Driesen's cavalry, till then refused, charged him in flank and scattered his troops in wild rout. This stroke ended the battle. The retreat on Breslau became a rout almost comparable to that of Waterloo, and Prince Charles rallied, in Bohemia, barely 37,000 out of his 82,000. Ten thousand Austrians were left on the field, 21,000 taken prisoners (besides 17,000 in Breslau a little later), with 31 colours and 116 cannon. The Prussian loss in all was under 5000. It was not until 1854 that a memorial of this astonishing victory was erected on the battlefield.

See Carlyle, Frederick, bk. xviii. cap. x.; V. Ollech, Friedrich der Grosse von Köln bis Leuthe (Berlin, 1858); Kutzen, Schlacht bei Leuthe (Breslau, 1854); and bibliography under Seven Years' War.

LEUTZE, EMANUEL (1816-1868), American artist, was born at Gnünd, Württemberg, on the 24th of May 1816, and as a child was taken by his parents to Philadelphia, where he early displayed talent as an artist. At the age of twenty-five he had earned enough to take him to Düsseldorf for a course of art study at the royal academy. Almost immediately he began the painting of historical subjects, his first work, "Columbus before the Council of Salamanca," being purchased by the Düsseldorf Art Union. In 1860 he was commissioned by the United States Congress to decorate a stairway in the Capitol at Washington, for which he painted a large composition, "Westward the Star of Empire takes its Way." His best-known work, popular through engraving, is "Washington crossing the Delaware," a large canvas containing a score of life-sized figures; it is now owned by the Metropolitan Museum of Art, New York. He became a member of the National Academy of Design in 1860, and died at Washington, D.C., on the 18th of July 1868.

LEVALLOIS-PERRET, a north-western suburb of Paris, on the right bank of the Seine, 23 m. from the centre of the city. Pop. (1906) 61,410. It carries on the manufacture of motor-cars and accessories, carriages, groceries, liqueurs, perfumery, soap, &c., and has a port on the Seine.

LEVANT (from the French use of the participle of lever, to rise, for the east, the orient), the name applied widely to the coastlands of the eastern Mediterranean Sea from Greece to Egypt, or, in a more restricted and commoner sense, to the Mediterranean coastlands of Asia Minor and Syria. In the 16th and 17th centuries the term "High Levant" was used of the Far East. The phrase "to levant," meaning to abscend, especially of one who runs away leaving debts unpaid, particularly of a betting man or gambler, is taken from the Span. levantar, to lift or break up, in such phrases as levantar la casa, to break up a household, or el campo, to break camp.

LEVASSEUR, PIERRE EMILE (1828— ), French economist, was born in Paris on the 8th of December 1828. Educated in Paris, he began to teach in the lycée at Alençon in 1852, and in 1857 was chosen professor of rhetoric at Besançon. He returned to Paris to become professor at the lycée Saint Louis, and in 1865 was chosen a member of the academy of moral and political sciences. In 1872 he was appointed professor of geography, history and statistics in the Collège de France, and subsequently became also professor at the Conservatoire des arts et métiers and at the École libre des sciences politiques. Levassier was one of the founders of the study of commercial geography, and became a member of the Council of Public Instruction, president of the French society of political economy and honorary president of the French geographical society.

His numerous writings include: Historie des classes ouvrières en France depuis la conquête de Jules César jusqu'à la Révolution (1859); Histoire des classes ouvrières en France depuis la Révolution jusqu'à nos jours (1867); L'Étude et l'enseignement de la géographie (1871); La Populace françoise (1860-1861); L'Agriculture aux États-Unis (1894); L'Enseignement primaire dans les pays civilisés (1897); L'Ouvrier américain (1898); Questions ouvrières et industrielles en la troisième République (1897); and Historie des classes ouvrières en France (1887). He also published a Grand Atlas de géographie physique et politique (1890-1892).

LEVÊCHE, the name given to the dry hot sirocco wind in Spain; often incorrectly called the "solano." The direction of the Levêche is mostly from S.E., S., or S.W., and it occurs also along the coast from Cabo de Gata to Cabo de Nao, and even beyond Malaga for a distance of some 10 m. inland.

LEVÈVE (from Fr. lever, to raise), an embankment which keeps a river in its channel. A river such as the Mississippi (q.v.), draining a large area, carries a great amount of sediment from its swift head-streams to the lower ground. As soon as a stream's velocity is checked, it drops a portion of its load of sediment and spreads an alluvial fan in the lower part of its course. This deposition of material takes place particularly at the sides of the stream where the velocity is least, and the banks are in consequence raised above the main channel, so that the river becomes lifted bodily upwards in its bed, and flows above the level of the surrounding country. In flood-time the muddy water flows over the river's banks, where its velocity is at once checked as it flows gently down the outer side, causing more material to be deposited there, and a long alluvial ridge, called a natural levee, to be built up on either side of the stream. These ridges may be wide or narrow, but they slope from the stream's outer banks to the plain below, and in consequence require careful watching, for if the levee is broken by a "crevasse," the whole body of the river may pour through and flood the country below. In 1890 the Mississippi near New Orleans broke through the Nita crevasse and flooded eastward with a current of 15 m. an hour, spreading destruction in its path. The Hwang-ho river in China is peculiarly liable to these inundations. The word levée is also sometimes used to denote a riverside quay or landing-place.

LEVÈVE (from the French substantival use of lever, to rise; there is no French substantival use of levée in the English sense), a reception or assembly held by the British sovereign or his representative, in Ireland by the lord-lieutenant, in India by the viceroy, in the forenoon or early afternoon, at which men only are present in distinction from a "drawing-room," at which ladies also are presented or received. Under the ancien régime in France the lever of the king was regulated, especially under Louis XIV., by elaborate etiquette, and the various divisions of the ceremonial followed the stages of the king's rising from bed, from which it gained its name. The petit lever began when the
king had washed and said his daily offices; to this were admitted the princes of the blood, certain high officers of the household and those to whom a special permit had been granted; then followed the première entrée, to which came the secretaries and other officials and those having the entrée; these were received by the king in his dressing-gown. Finally, at the grand lever, the remainder of the household, the nobles and gentlemen of the court were received; the king by that time was shaved, had changed his linen and was in his wig. In the United States the term "levee" was formerly used of the public receptions held by the president.

**LEVELLERS**—

LEVI FELLERS, the name given to an important political party in England during the period of the Civil War and the Commonwealth. The germ of the Levelling movement must be sought for among the Agitators (q.v.), men of strong republican views, and the first Leveller first appears in a letter of the 1st of November 1647, although it was undoubtedly in existence as a nickname before this date (Gardiner, Great Civil War, iii. 380). This letter refers to these extremists thus: "They have given themselves a new name, viz. Levellers, for they intend to set all things straight, and raise a party and community in the kingdom."

The Levellers first became prominent in 1647 during the protracted and unsatisfactory negotiations between the king and the parliament, and while the relations between the latter and the army were strained. Like the Agitators they were mainly found among the soldiers; they were opposed to the existence of kingship, and they feared that Cromwell and the other parliamentary leaders were too compliant in their dealings with Charles; in fact they doubted their sincerity in this matter. Led by John Lilburne (q.v.) they presented a manifesto, The Case of the Army truly stated to the commander-in-chief, Lord Fairfax, in October 1647. In this they demanded a dissolution of parliament within a year and substantial changes in the constitution of future parliaments, which were to be regulated by an unalterable "law paramount." In a second document, The Agreement of the People, they expanded these ideas, which were discussed by Cromwell, Ireton and other officers on the one side, and by John Wildman, Thomas Rainsborough and Edward Sexby for the Levellers on the other. But no settlement was made; some of the Levellers clamoured for the king's death, and in November 1647, just after his flight from Hampton Court to Carisbrooke, they were responsible for a mutiny which broke out in two regiments at Corkbush Field, near Ware. This, however, was promptly suppressed by Cromwell. During the twelve months which immediately preceded the execution of the king the Levellers did not elaborate their ideas, and during the 14th of January 1649 Lilburne was arrested for using seditious language at a meeting in London. But no success attended these and similar efforts, and their only result was that the Levellers regarded Cromwell with still greater suspicion.

Early in 1649, just after the death of the king, the Levellers renewed their activity. They were both numerous and dangerous, and they stood up, says Gardiner, "for an exaggeration of the doctrine of parliamentary supremacy." In a pamphlet, England's New Chains, Lilburne asked for the dissolution of the council of state and for a new and reformed parliament. He followed this up with the Second Part of England's New Chains; his writings were declared treasonable by parliament, and in March 1649 he and three other leading Levellers, Richard Overton, William Walwyn and Prince were arrested. The discontent which was spreading in the army was fanned when certain regiments were ordered to proceed to Ireland, and in April 1649 there was a meeting in London; but this was quickly put down by Fairfax and Cromwell, and its leader, Robert Lockyer, was shot. Risings at Burford and at Banbury were also suppressed without any serious difficulty, and the trouble with the Levellers was practically over. Gradually they became less prominent, but under the Commonwealth they made frequent advances to the exiled king Charles II., and there was some danger from them early in 1655 when Wildman was arrested and Sexby escaped from England. The distinguishing mark of the Leveller was a sea-green ribbon.

Another but more harmless form of the same movement was the assembling of about fifty men on St George's Hill near Oaklands in Surrey. In April 1649 these "True Levellers" or "Diggers," as they were called, took possession of some unoccupied ground which they began to cultivate. They were, however, soon dispersed, and their leaders were arrested and brought before Fairfax, when they took the opportunity of denouncing landowners. It is interesting to note that Lilburne and his colleagues objected to being designated Levellers, as they had no desire to take away "the proper right and title that every man has to what is his own."

Cromwell attacked the Levellers in his speech to parliament in September 1654 (Carlyle, Cromwell's Letters and Speeches, Speech II). He said: "A nobleman, a gentleman, a yeoman; the distinction of these; that is a good interest of the nation, and a great one. The 'natural' magnificacy of the nation, was it not almost trampled under foot, under despite and contempt, by men of Levelling principles? I beseech you, for the orders of men and ranks of men, did not that Levelling principle tend to the reducing of all to an equality? Did it 'consciously' think to do so; or did it 'only unconsciously' practise towards that for property and interest? 'At all events,' what was the purport of it but to make the tenant as liberal a fortune as the landlord? Which, I think, if obtained, would not have lasted long."

In 1724 there was a rising against enclosures in Galloway, and a number of men who took part therein were called Levellers or Dyke-breakers (A. Lang, Border Ballads, vol. ii. p. 89). The word was also used in Ireland during the 18th century to describe a secret revolutionary society similar to the Whiteboys. (A. W. H.*

**LEVEN, ALEXANDER LESLIE, 1ST EARL OF (c. 1580–1661), Scottish general, was the son of George Leslie, captain of Blair-Athol, and a member of the family of Leslie of Balquhain. After a scanty education he sought his fortune abroad, and became a soldier, first under Sir Horace Vere in the Low Countries, and afterwards (1605) under Charles IX. and Gustavus Adolphus of Sweden, in whose service he remained for many years and fought in many campaigns with honour. In 1626 Leslie had risen by merit to the rank of lieutenant-general, and had been knighted by Gustavus. In 1628 he distinguished himself by his constancy and energy in the defence of Stralsund against Wallenstein, and in 1630 seized the island of Rügen in the name of the king of Sweden. In the same year he returned to Scotland to assist in recruiting and organizing the corps of Scottish Volunteers which James, 3rd marquis of Hamilton, brought over to Gustavus in 1631. Leslie received a severe wound in the following winter, but was able nevertheless to be present at Gustavus's last battle at Lützen. Like many others of the soldiers of fortune who served under Gustavus, Leslie cherished his old commander's memory to the day of his death, and he kept with particular care a jewel and miniature presented to him by the king. He continued as a general officer in the Swedish army for some years, was promoted in 1636 to the rank of field marshal, and continued in the field until 1638, when events recalled him to his own country. He had married long before this—in 1637 his eldest son was made a colonel in the Swedish army—and he had managed to keep in touch with Scottish affairs.

As the foremost Scottish soldier of his day he was naturally nominated to command the Scottish army in the impending war with England, a post which, resigning his Swedish command, he accepted with a glad heart, for he was an ardent Covenanter and had caused "a great number of our commanders in Germany subscryve our covenant" (Baillie's Letters). On leaving Sweden he brought back his arrears of pay in the form of cannon and muskets for his new army. For some months he busied himself with the organization and training of the new levies, and with inducing Scottish officers abroad to do their duty to their country by returning to lead them. Diminutive in size and somewhat deformed in person as he was, his reputation and his shrewdness
and simple tact, combined with the respect for his office of lord general that he enforced on all ranks, brought even the unruly nobles to subordination. He had by now amassed a considerable fortune and was able to live in a manner befitting a commander-in-chief, even when in the field. One of his first exploits was to take the castle of Edinburgh by surprise, without the loss of a man. He commanded the Scottish army at Dunse Law in May of that year, and in 1640 he invaded England, and defeated the king's troops at Newburn on the Tyne, which gave him possession of Newcastle and of the open country as far as the Tees. At the treaty with the king at Ripon, Leslie was one of the commissioners of the Scottish parliament, and when Charles visited Edinburgh Leslie entertained him magnificently and accompanied him when he drove through the streets. His affirmations of loyalty to the crown, which later events caused to be remembered against him, were sincere enough, but the complicated politics of the time made it difficult for Leslie, the lord general of the Scottish army, to maintain a uniformly consistent attitude. However, his influence was exercised chiefly to put an end to, even to hush up, the troubles, and he is found, now giving a private warning to plotters against the king to enable them to escape, now guarding the Scottish parliament against a royalist coup d'état, and now securing for an old comrade of the German wars, Patrick Ruthven, Lord Etrick, indemnity for having held Edinburgh Castle for the king against the parliament. Charles created him, by patent dated Holyrood, October 11, 1641, earl of Leven and Lord Balgonie, and made him captain of Edinburgh Castle and a privy councillor. The parliament recognized his services by a grant, and, on his resigning the lordship, appointed him commander of the permanent forces. A little later, Leven, who was a member of the committee of the estates which exercised executive powers during the recess of parliament, used his great influence in support of a proposal to raise a Scottish army to help the elector palatine in Germany, but the Ulster massacres gave this force, when raised, a fresh direction and Leven himself accompanied it to Ireland as lord general. He did not remain there long, for the Great Rebellion (q.v.) had begun in England, and negotiations were opened between the English and the Scottish parliaments for mutual armed assistance. Leven accepted the command of the new forces raised for the invasion of England, and was in consequence freely accused of having broken his personal oath to Charles, but he could hardly have acted otherwise than he did, and at that time, and so far as the Scots were concerned, to the end of the struggle, the parliaments were in arms, professedly and to some extent actually, to rescue his majesty from the influence of evil counsellors.

The military operations preceding Marston Moor are described under GREAT REBELLION, and the battle itself under its own heading. Leven's great reputation, wisdom and tact made him an ideal commander for the allied army formed by the junction of Leven's, Fairfax's and Manchester's in Yorkshire. After the battle the allied forces separated, Leven bringing the siege of Newcastle to an end by storming it. In 1645 the Scots were less successful, though their operations ranged from Westmorland to Hereford, and Leven himself had many administrative and political difficulties to contend with. These difficulties became more pronounced when in 1646 Charles took refuge with the Scottish army. The king remained with Leven until he was handed over to the English parliament in 1647, and Leven continued to him to take the covenant and to make peace. Presbyterians and Independents had now parted, and with no more concession than the guarantee of the covenant the Scottish and English Presbyterians were ready to lay down their arms, or to turn them against the "sectaries." Leven was now old and infirm, and though retained as nominal commander-in-chief saw no further active service. He acted with Argyll and the "godly" party in the discussions preceding the second invasion of England, and remained at his post as long as possible in the hope of preventing the Scots becoming merely a royalist instrument for the conquest of the English Independents. But he was induced to the end to resign, though he was appointed lord general of all new forces that might be raised for the defence of Scotland. The occasion soon came, for Cromwell annihilated the Scottish invaders at Preston and Uttoxeter, and therupon Argyll assumed political and Leven military control at Edinburgh. But he was now over seventy years of age, and willingly resigned the effective command to his subordinate David Leslie (see NEWARK, LORD), in whom he had entire confidence. After the execution of Charles I. the war broke out afresh, and this time the "godly" party acted with the royalists. In the new war, and in the disastrous campaign of Dunbar, Leven took but a nominal part, though attempts were afterwards made to hold him responsible. But once more the parliament refused to accept his resignation. Leven at last fell into the hands of a party of English dragoons in August 1651, and with some others was sent to London. He remained imprisoned in the Tower for some time, till released on finding securities for £20,000, upon which he retired to his residence in Northumberland.

While sharing the legislature, he was again arrested, for a technical breach of his engagement, but by the intercession of the queen of Sweden he obtained his liberty. He was freed from his engagements in 1654, and retired to his seat at Balgonie in Fife-shire, where he died at an advanced age in 1661. He acquired considerable landed property, particularly Inchmaran in the Carse of Gourie, which he called Inchlesie.

See LEVEN AND MELVILLE, EARLS OF, below.

LEVEN, a police burgh of Fife-shire, Scotland. Pop. (1901) 9,577. It is situated on the Firth of Forth, at the mouth of the Leven, 5 m. E. by N. of Thornton Junction by the North British railway. The public buildings include the town hall, public hall and people's institute, in the grounds of which the old town cross has been erected. The industries are numerous, comprising flax-spinning, brewing, linen-weaving, paper-making, seed-crushing and rope-making, besides salt-works, a foundry, saw-mill and brick-works. The wet dock is not much used owing to the constant accumulation of sand. The golf-links extending for 2 m. to Lundin are among the best in Scotland. Two miles N.E. is Lundin Mill and Dromochie, usually called LUNDIN (pop. 570), at the mouth of Kiel Burn, with a station on the Links. The three famous standing stones are supposed to be either of "Druidal" origin or to mark the site of a battle with the Danes. In the vicinity are the remains of an old house of the Lundins, dating from the reign of David II. To the N.W. of Leven lies the parish of KENNOY (pop. 870). In Captain Seton's house, which still stands in the village of Kennoy, Archbishop Sharp spent the night before his assassination (1679). One mile east of Lundin lies LARGO (pop. of parish 2046), consisting of Upper Largo, or Kirkton of Largo, and Lower Largo. The public buildings include Simpson institute, with a public hall, library, reading-room, bowling-green and lawn-tennis court, and John Wood's hospital, founded in 1659 for poor persons bearing his name. A statue of Alexander Selkirk, or SelCraig (1676-1721), the prototype of "Robinson Crusoe," who was born here, was erected in 1886. Sir John Leslie (1766-1832), the natural philosopher, was also a native. Largo claims two famous sailors, Admiral Sir Philip Durham (1763-1843), commander-in-chief at Portsmouth from 1836 to 1839, and Sir Andrew Wood (d. 1831), the trusted servant of James III. and James IV., who sailed the "Great Michael," the largest ship of its time. When he was past active service he had a canal cut from his house to the parish church, to which he was rowed every Sunday in an eight-oared barge. Largo town is built on a hillside to a height of Largo Law (948 ft.). Kellie Law lies some 5 m. to the east.

LEVEN, LOCH, a lake of Kinross-shire, Scotland. It has an oval shape, the longer axis running from Newtow to S.E., has a length of 2.5 m., and a breadth of 0.3 m., and is situated near the south and east boundaries of the shire. It lies at a height of 350 ft. above the sea. The mean depth is less than 15 ft., with a maximum of 83 ft., the lake being thus one of the shallowest in Scotland. Reclamation works carried on from 1826 to 1836 reduced its area by one quarter, but it still possesses a surface
area of 53 sq. m. It drains the county and is itself drained by the Leven. It is famous for the Loch Leven trout (Salmo leuciscus, considered by some a variety of S. trutta), which are remarkable for size and quality. The fishings are controlled by the Loch Leven Angling Association, which organizes competitions attracting anglers from far and near. The loch contains seven islands. Upon St Serf's, the largest, which commemorates the patron saint of Fife, are the ruins of the Priory of Rothemoak—so named from St Moak, the first abbot—the oldest Culdee establishment in Scotland. Some time before 967 it was made over to the bishop of St Andrews, and shortly after 1144 a body of canons regular was established on it in connexion with the priory of canons regular founded in that year at St Andrews. The second largest island, Castle Island, possesses remains of even greater interest. The first stronghold is supposed to have been erected by Congal, son of Dongart, king of the Ficts. The present castle dates from the 13th century and was occasionally used as a royal residence. It is said to have been in the hands of the English for a time, from whom it was delivered by Wallace. It successfully withstood Edward Balliol's siege in 1314 and was granted by Robert II. to Sir William Douglas of Lugton. It became the prison at various periods of Robert II.; of Alexander Stuart, earl of Buchan; "the Wolf of Badenoch"; Archibald, earl of Douglas (1420); Patrick Graham, archbishop of St Andrews (who died, still in bondage, on St Serf's Island in 1478), and of Mary, queen of Scots. The queen had visited it more than once before her detention, and had had a presence chamber built in it. Conveyed hither in June 1567 after her surrender at Carberry, she signed her abdication within its walls on the 4th of July and effected her escape on the 2nd of May 1568. The keys of the castle, which were thrown into the loch during her flight, were found and are preserved at Dalmahoy in Midlothian. Support of Mary's cause had involved Thomas Percy, 7th earl of Northumberland (b. 1525). He too was lodged in the castle in 1560, and after three years' imprisonment was handed over to the English, by whom he was beheaded at York in 1572. The proverb that "Those never got luck who came to Loch Leven" sums up the history of the castle. The causeway connecting the island with the mainland was long submerged too deeply for use, but the reclamation operations already referred to almost brought it into view again.

LEVEN AND MELVILLE, EARLS OF. The family of Melville which now holds these two earldoms is descended from Sir John Melville of Raith in Fifehire. Sir John, who was a member of the reforming party in Scotland, was put to death for high treason on the 13th of December 1548; he left with other children a son Robert (1527-1621), who in 1616 was created a lord of parliament as Lord Melville of Monymaill. Before his elevation to the Scottish peerage Melville had been a stout partisan of Mary, queen of Scots, whom he represented at the English court, and he had filled several important offices in Scotland under her son James VI. The fourth holder of the lordship of Melville was George (c. 1634-1707), a son of John, the 3rd lord (d. 1674), and a descendant of Sir John Melville. Implicated in the Rye House plot against Charles II., George took refuge in Flanders in 1681, but he returned to England after the revolution of 1688 and was appointed secretary for Scotland by William III. in 1689, being created earl of Melville in the following year. He was made president of the Scottish privy council in 1696, but he was deprived of his office when Anne became queen in 1702, and he died on the 20th of May 1707. His son David, 2nd earl of Melville (1660-1728), fled to Holland with his father in 1683; after serving in the army of the elector of Brandenburg he accompanied William of Orange to England in 1688. At the head of a regiment raised by himself he fought for William of Orange and elsewhere, and as commander-in-chief of the troops in Scotland he dealt promptly and effectively with the attempted Jacobite rising of 1708. In 1712, however, his office was taken from him and he died on the 6th of June 1728.

Alexander Leslie, 1st earl of Leven (p. 282), was succeeded in his earldom by his grandson Alexander, who died without sons in July 1664. The younger Alexander's two daughters were then in turn countesses of Leven in their own right; and after the death of the second of these two ladies in 1675 a dispute arose over the succession to the earldom between John Leslie, earl (afterwards duke) of Rothes, and David Melville, 2nd earl of Melville, mentioned above. In 1681, however, Rothes died, and Melville, who was a great-grandson of the 1st earl of Leven, assumed the title, calling himself earl of Leven and Melville after he succeeded his father as earl of Melville in May 1707. Since 1805 the family has borne the name of Leslie-Melville. In 1806 John David Leslie-Melville (b. 1886) became 12th earl of Leven and 11th earl of Melville.

See Sir W. Fraser, The Melvilles, Earls of Melville, and the Leslies, Earls of Leven (1890); and the Leven and Melville Papers, edited by the Hon. W. H. Leslie-Melville for the Bannatyne Club (1843).

LEVER, CHARLES JAMES (1806-1872), Irish novelist, second son of James Lever, a Dublin architect and builder, was born in the Irish capital on the 31st of August 1806. His descent was purely English. He was educated in private schools, where he wore a ring, smoked, read novels, was a ringleader in every branch of discipline, and behaved generally like a boy destined for the navy in one of Captain Marryat's novels. His escapades at Trinity College, Dublin (1823-1828), whence he took the degree of M.B. in 1831, form the basis of that vast collection of anecdotes from which all the best vintages in his novels are derived. The inimitable Frank Webber in Charles O'Malley (spiritual ancestor of Foker and Mr Bouncer) was a college friend, Robert Boyle, later on an Irish parson. Lever and Boyle sang ballads of their own composing in the streets of Dublin, after the manner of Ferguson or Goldsmith, filled their caps with coppers and played many other pranks embroidered in the pages of O'Malley, Con Cregan and Lord Kilgobbin. Before seriously embarking upon the medical studies for which he was designed, Lever visited Canada as an unqualified surgeon on an emigrant ship, and has drawn upon some of his experiences in Con Cregan, Arthur O'Leary and Roland Cashed. Arrived in Canada he plunged into the backwoods, was affiliated to a tribe of Indians and had to escape at the risk of his life, like his own Bungalow Daly.

Back in Europe, he travelled in the guise of a student from Göttingen to Weimar (where he saw Goethe), thence to Vienna; he loved the German student life with its beer, its fighting and its fun, and several of his merry songs, such as "The Pope he loved a merry life" (greatly envied by Tittmarsh), are on Student-lied models. His medical degree admitted him to an appointment from the Board of Health in Co. Clare and then as dispensary doctor at Port Stewart, but the liveliness of his diversions as a country doctor seems to have prejudiced the authorities against him. In 1833 he married his first love, Catharine Baker, and in February 1837, after varied experiences, he began running The Confessions of Harry Lorrequer through the pages of the recently established Dublin University Magazine. During the previous seven years the popular taste had declared strongly in favour of the service novel as exemplified by Frank Mildmay, Tom Cringle, The Subaltern, Cyril Thornton, Stories of Waterloo, Ben Brawen, but it was Lever himself who had met William Hamilton Maxwell, the titular founder of the genre. Before Harry Lorrequer appeared in volume form (1839), Lever had settled on the strength of a slight diplomatic connexion as a fashionable physician in Brussels (16, Rue Ducate). Lorrequer was merely a string of Irish and other stories good, bad and indifferent, but mostly rollicking, and Lever, who strove together his anecdotes late at night after the serious business of the day was done, was astonished at its success. "If this sort of thing amuses them, I can go on for ever." Brussels was indeed a superb place for the observation of half-pay officers, such as Major Monsoon (Commissioner Meade), Captain Bubbleton and the like, who terrorized the taverns of the place with their endless peninsular stories, and of English society a little damaged, which it became the specialty of Lever to depict. He sketched with a free hand, wrote, as he lived, from hand to mouth, and the chief difficulty he experienced was that of getting rid of his
characters who "hung about him like those tiresome people who never can make up their minds to bid you good night." Lever had never taken part in a battle himself, but his next three books, Charles O'Malley (1841), Jack Hinton and Tom Burke of Ours (1843), written under the spur of the writer's chronic extravagance, contain some splendid military writing and some of the most animated battle-pieces on record. In pages of O'Malley and Tom Burke Lever anticipates not a few of the best effects of Marbot, Thibault, Lejeune, Grosi, Seruzier, Burgoyne and the like. His account of the Dourno need hardly fear comparison, it has been said, with Napier's. Condemned by the critics, Lever had completely won the general reader from the Iron Duke himself downwards.

In 1842 he returned to Dublin to edit the Dublin University Magazine, and gathered round him a typical coterie of Irish wits (including one or two hornets) such as the O'Sullivans, Archer Butler, W. Carleton, Sir William Wilde, Canon Hayman, D. F. McCarthy, McGlashan, Dr Kenealy and many others. In June 1843 he welcomed at Templeogue, 4 m. south-west of Dublin, the author of the Snob Papers on his Irish Tour (the Sketch Book was, later, dedicated to Lever). Thackeray recognized the fund of Irish sadness beneath the surface merriment. "The author's character is not humour but sentiment. The spirits are mostly artificial, the fondness is sadness, as appears to me, to be that of most Irish writing and people." The Waterloo episode in Vanity Fair was in part an outcome of the talk between the two novelists. But the "Galway pace," the display he found it necessary to maintain at Templeogue, the stable full of horses, the cards, the friends to entertain, the quarrels to compose and the enormous rapidity with which he had to complete Tom Burke, The O'Donnogue and Arthur O'Leary (1843), made his native land an impossible place for Lever to continue in. Templeogue would soon have proved another Abbotsford. Thackeray suggested London. But Lever required a new field of literary observation and anecdote. His stay there was exhausted and he decided to renew it on the continent. In 1845 he resigned his editorship and went back to Brussels, whence he started upon an unlimited tour of central Europe in a family coach. Now and again he halted for a few months, and entertained to the limit of his resources in some ducal castle or other which he hired for an off season. Thus at Riedenburg, near Bregenz, in August 1846, he entertained Charles Dickens and his wife and other well-known people. Like his Doltous or Dodd Family Abroad he travelled contidentally, from Carlshwe to Conmo, from Conmo to Florence, from Florence to the Baths of Lucca and so on, and his letters home are the litany of the literary remittance-hunter, his ambition now limited to driving a pair of novels abreast without a diminution of his standard price for serial work ("twenty pounds a sheet"). In the Knight of Gwynne, a story of the Union (1847), Con Cregan (1810), Roland Cashel (1850) and Maurice Tierney (1852) we still have traces of his old manner; but he was beginning to lose his original joy in composition. His fondness of sadness began to cloud the animal joyousness of his temperament. Formerly he had written for the happy world, which last long; and now he grew fat and bald and grave. "After 38 or so what has life to offer but one universal declension. Let the crew pump as hard as they like, the leak gains every hour." But, depressed in spirit as he was, his wit was unexhausted; he was still the delight of the salons with his stories, and in 1857, after a few years' experience of a similar kind at Spezia, he was cheered by a letter from Lord Derby offering him the more lucrative consulsiphip of Trieste. "Here is six hundred a year for doing nothing, and you are just the man to do it." The six hundred could not atone to Lever for the lassitude of prolonged exile. Trieste, at first "all that I could desire," became with characteristic abruptness "detestable and damnable," "Nothing to eat, nothing to drink, no one to speak to." "Of all the dreary places it has been my lot to sojourn in this is the worst" (some references to Trieste will be found in That Boy of Norcot's, 1869). He could never be alone and was almost morbidly dependent upon literary encouragement. Fortunately, like Scott, he had unscrupulous friends who assured him that his last efforts were his best. They include The Fortunes of Glencore (1847), Tony Butler (1866), Latrell of Arran (1856), Sir Brooke Fosbrooke (1866), Lord Kilgobbin (1872) and the table-talk of Cornelius O'Doaly, originally contributed to Blackwood. His depression, partly due to inelastic heart disease, partly to the growing conviction that he was the victim of literary and critical conspiracy, was confirmed by the death of his wife (23rd April 1879), to whom he was tenderly attached. He visited Ireland in the following year and seemed alternately in very high and very low spirits. Death had already given him one or two runaway knocks, and, after his return to Trieste, he failed gradually, dying suddenly, however, and almost painlessly, from failure of the heart's action on the 1st of June 1872. His daughters, one of whom, Sydney, is believed to have been the real author of The Rent in a Cloud (1869), were well provided for.

Trollope praised Lever's novels highly when he said that they were just like his conversation. He was a born raconteur, and had in perfection that easy flow of light description which without a strain leads up to the point of the good stories of which in earlier days his supply seemed inexhaustible. With little respect for unity of action or conventional novel structure, his brightest books, such as Loreeuer, O'Malley and Tom Burke, are in fact little more than recitals of scenes in the life of a particular "hero," unconnected by any continuous intrigue. The type of character he depicted is for the most part elementary. His women are mostly rouselle, romps or Xanthippe; his heroes have too much of the Pickle temper about them and fall an easy prey to the serious attacks of Poe or to the more playful gibes of Thackeray in Phil Fogarty or Bret Harte in Terence Deaville. This last is a perfect bit of burlesque. Terence exchanges nineteen shots with the Hon. Captain Henry Somerset in the glen. "At each fire I shot away a button from his uniform. As my last bullet shot off the last button from his sleeve, I remarked quietly, 'You seem now, my lord, to be almost as ragged as the gentry you sneered at,' and rode haughtily away." And yet Webber, Major Monsoon and Micky Free, "the Sam Weller of Ireland." Falstaff is alone in the literature of the world; but if ever there came a later Falstaff, Monsoon was the man. As for Baby Blake, is she not an Irish Di Vernon? The critics may praise Lever's thoughtful and careful later novels as they will, but Charles O'Malley will always be the pattern of a military romance.

Superior, it is sometimes claimed, in construction and style, the later books approximate it may be thought to the good ordinary novel of commerce, but they lack the extraordinary qualities, the incomunicable "go" of the early books—the élan of Lever's untamed youth. Artless and almost formless these productions may be, but they represent to us, as very few other books can, that pathetic ejaculation of Lever's own—"Give us back the wild freshness of the morning!" We know the novelist's teachers, Maxwell, Napier, the old-fashioned compilation known as Vicaires, contes et destres des Francois (1823), and the old buffets at Brussels who emptied the room by uttering the word "Badajoz." But where else shall we find the equals of the military scenes in O'Malley and Tom Burke, or the military episodes in Jack Hinton, Arthur O'Leary (the story of Aubuisson) or Maurice Tierney (nothing he ever did is finer than the chapter introducing "A remnant of Fontenoy")? It is here that his true genius lies, even more than in his talent for conviviality and fun, which makes an early copy of an early Lever (with Phiz's illustrations) seem literally to exhale an atmosphere of past and present entertainment. It is here that he is a true romanticist, not for boys only, but also for men.

Lever's lack of artistry and of sympathy with the deeper traits of the Irish character have been stumbling-blocks to his reputation among the critics. Except to some extent in The Martins of Cro'Martin (1856) it may be admitted that his portraits of Irish are drawn too exclusively from the type depicted in Sir Jonah Barrington's Memoirs and already well known on
the English stage. He certainly had no deliberate intention of “lowering the national character.” Quite the reverse. Yet his posthumous reputation seems to have suffered in consequence, in spite of all his Gallic sympathies and not unsuccessful endeavours to apotheosize the “Irish Brigade.”

The chief authorities are the Life, by W. J. Fitzpatrick (1879), and the Letters, ed. in 2 vols. by Edmund Downey (1860), neither of which, however, enables the reader to penetrate below the surface. See also J. Bennett in Dict. Nat. Biog. Dublin Univ. Mag. (1880), 455 and 570; Anthony Trollope’s Autobiography; Blackwood (August 1862); Fortnightly Review, vol. xxxii.; Andrew Lang’s Essays in Little (1892); Henley’s Views and Reviews; Hugh Walker’s Literature of the Victorian Period (1910); The Bookman (1896); English Literature (1906), p. 667; Bookman (June 1906; portraits). An early edition of the novels in 37 vols. appeared 1897–1899 under the superintendence of Lever’s daughter, Julie Kate Neville. (T. Se.)

LEVER (through O. Fr. levée, levere, mod. levier, from Lat. levare, to lift, raise), a mechanical device for raising bodies; the "simple" lever consists of a rigid bar free to move about a fixed point, termed the fulcrum; one point of the rod is connected to the piece to be moved, and power is applied at another point (see MECHANICS).

LEVERRIE, URBAIN JOSEPH (1811–1877), French astronomer, was born at St Lô in Normandy on the 11th of March 1811. His father, who held a small post under government, made great efforts to send him to Paris, where a brilliant examination gained him, in 1831, admittance to the École Polytechnique. The distinction of his career there was rewarded with a free choice amongst the departments of the public service open to pupils of the school. He selected the administration of tobacco, addressing himself especially to chemical researches under the guidance of Gay-Lussac, and gave striking proof of ability in two papers on the combinations of phosphorus with hydrogen and oxygen, published in Annales de Chimie et de Physique (1835 and 1837). His astronomical vocation, like that of Kepler, came from without. The place of teacher of that science at the École Polytechnique falling vacant in 1837, it was offered to and accepted by Leverrier, who, “docile to circumstance,” instantly abandoned chemistry, and devoted the whole of his powers to celestial mechanics.

The first fruits of his labours were contained in two memoirs presented to the Academy, September 16 and October 14, 1839. Pursuing the investigations of Laplace, he demonstrated with greater rigour the stability of the solar system, and calculated the limits within which the eccentricities and inclinations of the planetary orbits vary. This remarkable début excited much attention, and, on the recommendation of François Arago, he took in hand the theory of Mercury, producing, in 1843, vastly improved tables of that planet. The perturbations of the comets discovered, the one by H. A. E. A. Faye in November 1843, the other by Francesco de Vico a year later, were minutely investigated by Leverrier, with the result of disproving the supposed identity of the first with Lexell’s lost comet of 1770, and of the other with Tycho’s of 1585. On the other hand, he made it appear all but certain that Vico’s comet was the same with one seen by Philippe de La Hire in 1688. Recalled once more, by the summons of Arago, to planetary studies, he was this time invited to turn his attention to Uranus. Step by step, with sagacious and patient accuracy, he advanced to the great discovery which has immortalized his name. Carefully sitting all the known causes of disturbance, he showed that one previously unknown had to be reckoned with, and on the 23rd of September 1846 the planet Neptune was discerned by J. G. Galle (d. 1910) at Berlin, within one degree of the spot Leverrier had indicated (see NEPTUNE).

This memorable achievement was greeted with an outburst of public enthusiasm. Academies vied with each other in enrolling Leverrier among their members; the Royal Society awarded him the Copley medal; the king of Denmark sent him the order of the Dannebrog; he was named officer in the Legion of Honour, and preceptor to the comte de Paris; a chair of astronomy was created for his benefit at the Faculty of Sciences; he was appointed adjutant astronomer to the Bureau of Longitudes. Returned to the Legislative Assembly in 1849 by his native department of Manche, he voted with the anti-republican party, but devoted his principal attention to subjects connected with science and education. After the coup d’état of 1851 he became a senator and inspector-general of superior instruction, sat upon the commission for the reform of the École Polytechnique (1854), and, on the 30th of January 1854, succeeded Arago as director of the Paris observatory. His official work in the latter capacity would alone have strained the energies of an ordinary man. The institution had fallen into a state of lamentable inefficiency. Leverrier placed it on a totally new footing, freed it from the control of the Bureau of Longitudes, and raised it to its due rank among the observatories of Europe. He did not escape the common lot of reformers. His uncompromising measures and unconciliatory manner of enforcing them raised a storm only appeased by his removal on the 4th of February 1870. On the death of his successor Charles Eugène Delaunay (1816–1872), he was reinstated by Thiers, but with authority restricted by the supervision of a council. In the midst of these disquietudes, he executed a task of gigantic proportions. This was not hinging less than the complete revision of the planetary theories, followed by a laborious comparison of results with the most authentic observations, and the construction of tables representing the movements thus corrected. It required all his indomitable perseverance to carry through a purpose which failing health continually menaced with frustration. He had, however, the happiness of living long enough to perfect his work. Three weeks after he had affixed his signature to the printed sheets of the theory of Neptune he died at Paris on the 23rd of September 1877. By his marriage with Mademoiselle Choquet, who survived him little more than a month, he left a son and daughter.

The discovery with which Leverrier’s name is popularly identified was only an incident in his career. The elaboration of the scheme of the solar system, the researches into the causes of its irregularities, was its larger aim, for the accomplishment of which forty years of unremitting industry barely sufficed. He nevertheless found time to organize the meteorological service in France and to promote the practical use of instrumental methods by forming the Association Scientifique, and was active in introducing a practical scientific element into public education. His inference of the existence, between Mercury and the sun, of an appreciable quantity of circum-solar matter, of which the first direct evidence was not yet verified. He was twice, in 1868 and 1876, the recipient of the gold medal of the Royal Astronomical Society, London, and the university of Cambridge conferred upon him, in 1875, the honorary degree of LL.D. His planetary and solar tables were adopted by the Nautical Almanac, as well as by the Connaissance des temps.

The Annales de l’Observatoire de Paris, the publication of which was set on foot by Leverrier, contain, in vols. i.-vi. (Mémoires) (1839–1846), i.-vi. (Périodiques) (1847–1852), and x.-xi. (Mémoires de la classe de mathématiques) (1853–1862). That entitled Développements sur différents points de la théorie des perturbations (1841), was translated in part xviii. of Taylor’s Scientific Memoirs. For his scientific work see Professor Adams’s address, Monthly Notices, xxxvi. 232, and L. Tisserand’s latter influence, planetary observations, and warnings (1880). For a notice of his life, J. Bertrand’s “Éloge historique,” Mémo. de l’Ac. des Sciences, tome xli., 2ème série (A. M. C.)

LEVERTIN, OSCAR IVAN (1862–1906), Swedish poet and man of letters, was born of Jewish parents at Norrköping on the 17th of July 1862. He received his doctorate in letters at Upsala in 1887, and was subsequently docent at Upsala, and later professor of literature at Stockholm. Enforced sojourns in southern Europe on account of health familiarized him with foreign languages. He began by being an extreme follower of the naturalist school, but on his return in 1890 from a two years’ residence in Davos he wrote, in collaboration with the poet C. G. Verner von Heldenstam (b. 1859), a novel, Pettits bröllop (1890), which was a direct attack on naturalism. His later volumes of short stories, Racoconouveler and Sista noveller, are fine examples of modern Swedish fiction. The lyrical beauty of his poems, Legender och risor (1891), placed him at the head of the romantic renaissance in Sweden. In his poems entitled Nya Dikter (1894) he drew his material partly from medieval sources, and a third
volume of poetry in 1902 sustained his reputation. His last
poetical work (1905) was Kung Salomo och Morals, poems founded
on an eastern legend. As a critic he first attracted attention by
his books on the Gustavian age of Swedish letters: Teater och
drama under Gustaf III. (1880), &c. He was an active colla-
borator in the review Ord och Bild. He died in 1906, at a time
when he was engaged on his Linné, posthumously published,
a fragment of a great work on Linnaeus.

LEVI, HERMANN (1839-1900), German orchestral conductor,
was born at Giessen on the 7th of November 1839, and was the
son of a Jewish rabbi. He was educated at Giessen and Mann-
heim, and came under Vincenz Lachner's notice. From 1855 to
1858 Levi studied at the Leipzig conservatory, and after a
series of travels which took him to Paris, he obtained his first
post as music director at Saarbrücken, which post he exchanged
for that at Mannheim in 1861. From 1862 to 1864 he was chief
conductor of the German opera in Rotterdam, then till 1872
at Carlsruhe, when he went to Munich, a post he held until 1876,
when ill-health compelled him to resign. Levi's name is ind-
dissolubly connected with the increased appreciation of
Wagner's music. He conducted the first performance of Parsifal
at Bayreuth in 1882, and was connected with the musical life
of that place during the remainder of his career. He visited
London in 1895.

LEVI, LEONE (1827-1888), English jurist and statistician,
was born of Jewish parents on the 6th of June 1827, at Ancona,
Italy. After receiving an early training in a business house in
his native town, he went to Liverpool in 1844, became naturalized,
and changing his faith, joined the Presbyterian church. Per-
ceiving the necessity, in view of the unsystematic condition of
the English law on the subject, for the establishment of chambers
and tribunals of commerce in England, he warmly advocated
their institution in numerous pamphlets; and as a result of his
labours the Liverpool Chamber of Commerce, of which Levi was
made secretary, was founded in 1849. In 1850 Levi published his
Commercial Law of the World, being an exhaustive and com-
parative treatise upon the laws and codes of mercantile countries.
Appointed in 1857 to the chair of commercial law in King's
College, London, he proved himself a highly competent and
popular instructor, and his evening classes were a most success-
ful innovation. He was called to the bar at Lincoln's Inn in 1859,
and received from the university of Tübingen the degree of
doctor of political science. His chief work—History of British
Commerce and of the Economic Progress of the British Nation,
1763-1870, is perhaps a rather too partisan account of British
economic development, being a eulogy upon the blessings of
Free Trade, but its value as a work of reference cannot be
 gainsaid. Among his other works are: Work and Pay; Wages
and Earnings of the Working Classes; International Law, with
Materials for a Code. He died on the 7th of May 1888.

LEVIATHAN, the Hebrew name (leyvāthān), occurring in the
poetical books of the Bible, of a gigantic animal, apparently
the sea or water equivalent of behemoth (q.v.), the king of the
animals in the dry land. Job xxv. 13 it would seem to repre-
sent a crocodile; in Isaiah xxxiv. 5 it is crooked and piercing
snake, the dragon of the sea; cf. Psalms civ. 26. The etymology
of the word is uncertain, but it has been taken to be connected
with a root meaning "to twist." Apart from its scriptural
usage, the word is applied to any gigantic marine animal such
as the whale, and hence, figuratively, of very large ships, and
also of persons of outstanding strength, power, wealth or influ-
ence. Hobbes adopted the name as the title of his principal work,
applying it to "the multitude so united in one person...called
a commonwealth... This is the generation of that Leviathan,
or rather... of that mortal God, to which we owe under the
immortal God, our peace and defence."

LEVIRATE (Lat. levir, a husband's brother), a custom,
sometimes even a law, compelling a dead man's brother to
marry his widow. It seems to have been widespread in primitive
times, and is common to-day. Of the origin and primitive
purpose of the levirate marriage various explanations have been
put forward:—

1. It has been urged that the custom was primarily based
on the law of inheritance; a wife, regarded as a chattel, being
inherited like other possessions. The social advantage of pro-
viding one who should maintain the widow doubtless aided
the spread of the custom. The abandonment of a woman and her
children in the nomadic stage of civilization would be equiva-
 lent to death for them; hence with some peoples the levirate
became a duty rather than a right. Among the Thlinkets,
for example, when a man dies, his brother or his sister's son
must marry the widow, a failure in this duty occasioning
feuds. The obligation on a man to provide for his sister-in-law
is analogous to other duties devolving on kinsfolk, such as the
vendetta.

2. J. F. McLennan, however, would assume the levirate to be
a relic of polyandry, and in his argument lays much stress on the
fact that it is the dead man's brother who inherits the widow.
But among many races who follow the custom, such as the
Fijians, Samoans, Papuans of New Guinea, the Caroline Islanders,
and some tribes in the interior of Western Equatorial Africa,
the rule of inheritance is to the brother first. Thus among the
Santals, "when the elder brother dies, the next younger inherits
the widow, children and all the property." Further, there is
no known race where it is permitted to a son to marry his own
mother. Inheriting a woman in primitive societies would be
always tantamount to marrying her, and, apart from any special
laws of inheritance, it would be natural for the brother to take
over the widow. In polygamous countries where a man leaves
many widows the son would have a right of ownership over
these, and could dispose of them or keep them as he pleased,
his own mother alone excepted. Thus among the Bakalai, an
African tribe, widows may marry the son of their dead husband,
or in default of a son, can live with the brother. The Negroes
of Benin and the Gabun and the Kaffirs of Natal have similar
customs. In New Caledonia every man, married or single,
must immediately marry his brother's widow. In Polynesia the
levirate has the force of law, and it is common throughout
America and Asia.

3. Another explanation of the custom has been sought in a
semi-religious motive which has had extraordinary influence in
countries where to die without issue is regarded as a terrible
calamity. The fear of this catastrophe would readily arise
among people who did not believe in personal immortality,
and to whom the extinction of their line would be tantamount
to abolition. Or it is easily conceivable as a natural result
of ancestor-worship, under which failure of offspring entails
deprivation of cherished rites and service. Thus it is only when
the dead man has no offspring that the Jewish, Hindu and
Malagasy laws prescribe that the brother shall "raise up seed"
to him. In this sense the levirate forms part of the Deuteronome
Code, under which, however, the obligation is restricted to the
brother who "dwelleth together" (i.e. on the family estate)
with the dead man, and the first child only of the levirate
marriage is regarded as that of the dead man. That the custom
was obsolescent seems proved by the enjoining of ceremony on
the brother who wished to evade the duty, though he had to
submit to an insult from his sister-in-law, who draws off his
sandals and spits in his face. The Biblical story of Ruth ex-
emplifies the custom, though with further modifications (see
Ruth, Book of). Finally the custom is forbidden in Leviticus,
though in New Testament times the levirate law was still observed
by some Jews. The ceremony ordained by Deuteronomy is still
observed among the orthodox. Among the Hindus the levir
did not take his brother's widow as wife, but he had intercourse
with her. This practice was called nityaga.

4. Yet another suggested origin of the levirate is agrarian,
the motive being to keep together under the levirate husband the

1 An expression of this idea is quoted from the Mahābhārata
(Muir's trans.), by Max Muller (Gifford Lectures), Anthropological
Religion, p. 31—
That stage completed, seek a wife
And gain the fruit of wedded life,
A race of sons, by rites to seal,
When thou art gone, thy spirit's weal."
property which would otherwise have been divided among all the brothers or next of kin.

LEVIS—Edward disparity.

LEVITES, or sons of Levi (son of Jacob by Leah), a sacred caste in ancient Israel, the guardians of the temple service at Jerusalem.

1. Place in Ritual.—In the developed hierarchic system the ministers of the sanctuary are divided into distinct grades. All are "Levites" by descent, and are thus correlated in the genealogical and other lists, but the true priesthood is confined to the sons of Aaron, while the mass of the Levites are subordinate servants who are not entitled to approach the altar or to perform any strictly priestly function. All access to the Deity is restricted to the one priesthood and to the one sanctuary at Jerusalem; the worshipping subject is the nation of Israel as a unity, and the function of worship is discharged on its behalf by divinely chosen priests. The ordinary individual may not intrude under penalty of death; only those of Levitical origin may perform service, and they are essentially the servants and hereditary serfs of the Aaronite priests (see Num. xviii.). But such a scheme finds no place in the monarchy; it presupposes a hierarchy under which the priesthood increased its rights by claiming the privileges which past kings had enjoyed; it is the outcome of a complicated development in Old Testament religion in the light of which it is to be followed (see *Hebrew Religion*).

First (a), in the earlier biblical writings which describe the state of affairs under the Hebrew monarchy there is not this fundamental distinction among the Levites, and, although a list of Aaronite high-priests is preserved in a late source, internal details and the absence of the words of the Levites in the lists of the fathers of the tribes have led to their being thought doubtful (1 Chron. vi. 3-15, 40-53). In Jerusalem itself the subordinate officers of the temple were not members of a holy guild, but of the royal body-guard, or bond-slaves who had access to the sacred courts, and might even be uncircumcised foreigners (Josh. ix. 27; 1 Kings xiv. 28; 2 Kings xi.; cf. Zeph. i. 8 seq.; Zech. xiv. 21). Moreover, ordinary individuals might serve as priests (1 Sam. ii. 11, 18; 1 Chron. ii. 18, 19; 2 Chron. viii. 18, deliberately altered in 1 Chron. xviii. 17); however, every Levite was a priest, or at least qualified to become one (Deut. x. 8, xviii. 7; Judges xiv. vi.); and when the author of 1 Kings xii. 31, wishes to represent Jeroboam's priests as illegitimate, he does not say that they were not Aaronites, but that they were not of the sons of Levi.

The next stage (b) is connected with the suppression of the local high places or minor shrines in favour of a central sanctuary. This involved the suppression of the Levitical priests in the country (cf. perhaps the allusion in Deut. xxvi. 5); and the present book of Deuteronomy, in promulgating the reform, represents the Levites as more scattered "sojourners" and recommends them to the charity of the people (Deut. xx. 12, 18 seq. xiv. 27, 29, xvi. 11, 14, xxvi. 11 sqq.). However, they are permitted to congregate at "the place which Yahweh shall choose," where they may perform the usual priestly duties together with their brethren who "stand there before Yahweh," and they are

allowed their share of the offerings (Deut. xviii. 6-8).2 The Deuteronomistic history of the monarchy actually ascribes to the Judaean king Josiah (621 B.C.) the suppression of the high-places, and states that the local priests were brought to Jerusalem and received support, but did not minister at the altar (2 Kings xxii. 6). Finally, a scheme of ritual for the second temple raises this exclusion to the rank of a principle. The Levites who had been violators are punished by exclusion from the proper priestly work, and the subordinate offices which the uncircumcised and polluted foreigners had formerly filled, while the sons of Zadok, who had remained faithful, are henceforth the legitimate priests, the only descendants of Levi who are admitted to minister unto Yahweh (Ezek. xxxvi. 6-15, cf. xl. 36, xlii. 10, xlvii. 11). "A threefold cord is not quickly broken," and these three independent witnesses agree in describing a significant innovation which ends with the supremacy of the Zadokites of Jerusalem over their brethren.

In the last stage (c) the exclusion of the ordinary Levites from all share in the priesthood of the sons of Aaron is looked upon as a matter of course, dating from the institution of priestly worship by Moses. The two classes are supposed to have been founded separately (Exod. vi. 19-20; Josh. v. 6-7; Num. x. cf. Zadok's name from any degradation being attached to the rank and file of the Levites, their position is naturally an honourable one compared with that of the mass of non-Levitical worshippers (see Num. i. 50-53), and they are taken by Yahweh as a surrogate for the male first-born of Israel (iii. 11-13). They are inferior only to the Aaronites to whom they are "joined " (xviii. 2, a play on the name Levi) as assistants. Various adjustments and modifications still continue, and a number of scattered details may indicate that internal rivalries made themselves felt. But the different steps can hardly be recovered clearly, although the fact that the priesthood was extended beyond the Zadokites to families of the dispossessed priests points to some compromise (1 Chron. xxiv.). Further, it is subsequently found that certain portions of temple servants, the singers and porters, who had been outside the Levitical guilds, became absorbed as the term "Levite" was widened, and this change is formally expressed by the genealogies which ascribe to Levi, the common "ancestor" of them all, the singers and even certain families whose heathenish and foreign names show that they were once mere servants of the temple.3

2 Significance of the Development.—Although the legal basis for the final stage is found in the legislation of the time of Moses (latter part of the second millennium B.C.), it is in reality scarcely earlier than the 5th century B.C., and the Jewish theory finds analogies when developments of the Levitical service are referred to David (1 Chron. xvii. seq., xxiii. seq.), Hezekiah (2 Chron. xxix.), and Josiah (xxvii.)—contrast the history in the earlier books of Samuel and Kings; or when the still later book of Jubilees (xxxii.) places the rise of the Levitical priesthood in the patriarchal period. The traditional theory of the Mosaic origin of the elaborate Levitical legislation cannot be maintained save by the most arbitrary and inconsequent treatment of the evidence and by an entire indifference to the historical spirit; and, although numerous points of detail still remain very obscure, the three leading stages in the Levitical institutions are now recognized by nearly all independent scholars. These stages with a number of concomitant features confirm the literary hypothesis that biblical history is in the main due to two leading recensions, the Deuteronomistic and the Priestly (cf. b and c) above, which have incorporated older sources.4 If the hierarchical system as seen in the "The words " beside which cometh the sale of his patriarchal" (Deut. xiv. 29; see according to the fathers) "are obscure; they seem to imply some additional source of income which the Levites enjoys at the central sanctuary."

3 For the ethnom ("given") and "children of the slaves of Solomon" (whose hereditary service would give them a pre-eminence over the temple slaves), see art. NEHIMIN, and BENZINGER, *Ency. Bibl.* cols. 3397 sqq.

4 In defence of the traditional view, see S. I. Curtiss, *The Levitical Priesthood* (1877), with which his later attitude should be contrasted (see *Primitive Semitic Religion* To-day, pp. 14, 50, 133 seq., 171, 238 seq., 241 sqq.); W. L. Baxter, *Sanctuary and Sacrifice* (1885):
it existed in the post-exilic age was really the work of Moses, it is inexcusable that all trace of it was so completely lost that the degradation of the non-Zadokites in Ezekiel was a new feature and a punishment, whereas in the Mosaic law the ordinary Levites, on the traditional view, were already forbidden priestly rights under penalty of death. There is in fact no clear evidence of the existence of a distinction between priests and Levites in any Hebrew legal text earlier than the Deuteronomic stage, although, even as the Pentateuch contains ordinances which have been carried back by means of a "legal convention" to the days of Moses, writers have occasionally altered earlier records of the history to agree with later standpoints.

No argument in support of the traditional view can be drawn from the account of Korah's revolt (Num. xvi. sqq.; see § 3) or from the Levitical cities (Num. xxxiv.; Josh. xxi.). Some of the latter were either not conquered by the Israelites until long after the invasion, or, if conquered, were not held by Levites; and names are wanting of places in which priests are actually known to have lived. Certain the names are largely identical with ancient holy cities, which, however, are holy because they possessed noted shrines, not because the inhabitants were members of a holy tribe. Gezer and Shihem, for example, are said to have remained in the hands of the Canaanites (Judges ii. 27, 29; cf. I Kings ix. 16), and recent excavation has shown how far the cultus of these cities was removed from Mosaic doctrine and ritual and how long the grosser elements persisted. On the other hand, some of the Levitical cities, even those of the post-exilic age, say, Gibeon and Jericho, were ministers, all of whom in time could be called Levitical, and it is only in this sense, not in that of the late priestly legislation, that a place like Shechem could ever have been included. Further, instead of having a clear cut-off line between Levitical and non-Levitical, even the places described as scattered and divided (Gen. xix. 7; Deut. xviii. 6), and though they may naturally possess property as private individuals, they alone of all the tribes of Israel possess no tribal inheritance. All the Levites, whether in the north or the south, are found in the Pentateuch later than the generation of the Exodus, and the names of the Levitical cities, though found in the exilic period, are in other cases simply geographical terms.

3. The Traditions of the Levites.—In the "Blessing of Moses" (Deut. xxxiii. 8-11), Levi is a collective name for the priesthood, probably that of (north) Israel. He is the guardian of the sacred oracles, knowing no kin, and enjoying his privileges for proofs of fidelity at Massah and Meribah. That these places (in the district of Kadesh) were traditionally associated with the origin of the Levites is suggested by various Levitical stories, although it is in a narrative now in a context pointing to Horeb or Sinai that the Levites are Israelites who for some cause (now lost) severed themselves from their people and took up a stand on behalf of Yahweh (Exod. xxxiii.). Other evidence allows us to link together the Kenites, Calebites and Danites in a tribe which, though not separate, is quite distinct from the great invasion of Israelite tribes which predominate in the existing records. The priesthood of Dan certainly traced its origin to Moses (Judges xvii. 9, xviii. 30); that of Shiloh claimed an equally high ancestry (1 Sam. ii. 27 seq.; 6) Some tradition of a widespread movement appears to be ascribed to the age of Jehu, whose accession, promoted by the prophet Elisha, marks the end of the conflict between Yahweh and Baal. To a Rechabite (the clan is allied to the Kenites) it is definitely ascribed a hand in Jehu's sanguinary measures, and, though little is told of the obviously momentous events, one writer clearly alludes to a bloody period when reforms were to be effected by the sword (1 Kings xix. 17). Similarly the story of the original selection of the Levites in the wilderness mentions an uncompromising massacre of idolaters. Consequently, it is very noteworthy that popular tradition preserves the recollection of some attack by the "brothers" Levi and Simeon of Israel, it may be observed that no adequate interpretation has yet been found of the ethnological traditions of Levi and other sons of Leah in their historical relation to one another or to the other tribes. However intelligible may be the notion of a tribe reserved for priestly service, the fact that it does not apply to early biblical history is apparent from the heterogeneous details of the Levitical divisions. The incorporation of singers and porters is indeed a late process, but it is typical of the tendency to co-ordinate all the religious classes (see Genealogy: Biblical). The genealogies in their complete form pay little heed to Moses, although Aaron and Moses could typify the priesthood and other Levites generally (1 Chron. xxii. 14). Certain priesthoods in the first stage (§ 1 (a)) claimed descent from these prototypes, and it is interesting to observe (1) the growing importance of Aaron in the later sources of "the Exodus," and (2) the relation between Moshe (Moses) and his twin in the naming of Aaron and Miriam. The names of the Levitical priest Eleazar, on the other. There are links, also, which unite Moses with Kenite, Rechabite, Calebite and Edomite families, and the Levitical names themselves are equally connected with the southern tribes of Judah and Simeon and with the Edomites.

It is to be inferred, therefore, that some relationship subsisted, or was thought to subsist, among (1) the Levites, (2) clans actually located in the south of Palestine, and (3) families whose names and traditions point to a southern origin. The exact meaning of these features is not clear, but if it be remembered (a) that the Levites of post-exilic literature represent only the result of a long and intricate development, (b) that the name "Levite," in the later stages at least, was extended to include all priestly servants, and (c) that the priesthoods, in tending to become hereditary, included priests who were Levites by adoption and not by descent, it will be recognized that the examination of the evidence for the earlier stages cannot confine itself to those narratives where the specific term alone occurs.

A. van Hooenacker, Le Sacerdoce levitique (1889); and J. Orr, Problem of the O.T. (1905). These and other apologetic writings have so far failed to produce any adequate alternative hypothesis, and while they argue for the traditional view, later revision not being excluded, the modern critical view accepts letters, written for the literary sources in their present form, and explicitly recognizes the presence of much that is ancient. Note the curious old tradition that Ezra wrote out the law which had been burnt (2 Esdr. xiv. 21 ff.).

For the present disorder in the text of 2 Sam. xxiv. 17, see the commentary.

3 A messenger was often fully "in Israel" (cf. Judges xx. 6 and often), and in 36, "Jacob" is not a personal but a collective idea, for he says, "I am a few men," and the capture and destruction of a considerable city is in the nature of things the work of two individuals. In the allusion to Levi and Simeon in Gen. xlix. the two are spoken of as "brothers" with a communal assembly. See, for other examples of personification, Genealogy: Biblical.

4 See E. Meyer, Israeliten u. ihre Nachbarstämme, pp. 299 sqq. (passim); S. A. Cook, Encyc. Bibl. col. 1665 seq.; Crit. Notes on O.T. History (pp. 84 seq.) to 122-125.

5 The second element of the name Abiathar is connected with Jether or Jethro, the father-in-law of Moses, and even Ichabod (1 Sam. iv. 21) seems to be an intentional reshaping of Jehovah, which elsewhere is the name of the mother of Moses. Phinehas, Eli's son, becomes in later writings the name of a prominent Aaronite priest in the days of the exodus from Egypt.
upon the famous holy city of Shechem to avenge their 'sister' Dinah (Gen. xxix.), and that a detailed narrative tells of the bloody fight though pious Danites who sacked an Ephraimite shrine on their journey to a new home (Judges xvii. sq.).

The older accounts utilized by the Deuteronomistic and later compilers indicate some common tradition which has found expression in these varying forms. Different religious standpoints are represented in the biblical writings, and it is now important to observe that the prophecy of the post-exilic period, above all its apocalyptic character, show no such attitude in Israelite priesthood. The condemnation of Jehu's bloodshed (Hos. i. 4) gives another view of events in which both Elijah and Elisha were concerned, and the change is more vividly realized when it is found in the account of the high priest and Levites of Judah, the traditional founders of Israelite religion and ritual, is ascribed an offence whereby they incurred Yahweh's wrath (Num. xx. 12, 24, xxvii. 14; Deut. ix. 20, xxxii. 51). The sanctuaries of Shiloh and Dan lasted until the deposition of priest contemporary with the foundation of the first temple (1 Kings ii. 27, 35). These situations cannot be severed from what is known elsewhere of the Deuteronomistic teaching, of the reform ascribed to Josiah, or of the principle inculcated by Ezekiel (see § 1 [b]). The late specific tendency in favour of Jerusalem arises with the Deuteronomistic editor of Kings who condemns the sanctuaries of Dan and Bethel for calf-worship (1 Kings xii. 28-31), and does not acknowledge the northern priesthood to be Levitical (1 Kings xii. 31, note 14). If the high priest Shaphan is that of Zadok, his standpoint is that Aaron is condemned for the manufacture of the golden calf, and a compiler (not the original writer) finds its sequel in the present of the faithful Levites.

In the third great stage there is another change in the tone. The present (priestly) recension of Gen. xxxiv. has practicly justified Levi and Simeon from its standpoint of opposition to intermarriage, and in spite of Jacob's curse (Gen. xlix. 5-7) later traditions continue to extol the slaughter of the Shechemites as a holy duty. Post-exilic revision has also hopelessly obscured the essence of Moses and Aaron, although there was always a late tendency to place the blame upon the people (Deut. i. 19, xxxii. 26, iv. 21). When two-thirds of the priestly families are said to be Zadokites and one-third are of the families of Abiathar, no reconciliation, some adjustment of rivalries, is to be recognized (1 Chron. xxvii.). Again, in the composition of the form of its revolt, while one version reflects a contest between Aaronites and the other Levites who claimed the priesthood (Num. xvi. 8-11, 36-40), others attribute the supremacy of the Levites as a caste either over the people (cf. the prayer, Deut. xxxiii. 11), or, since the latter are under the leadership of Korah, the eponym of a gild of singers, perhaps over the more subordinate ministers who once formed a separate class.

In the composite work Chronicles-Ezra-Nehemiah (dating after the post-exilic Levitical legislation) a peculiar interest is taken in the Levites, more particularly in the singers, and certain passages even reveal another development in Israelite religion, observe that Judaean cultic activity was continued in part by a Levitical author of a work which was ascribed to Moses, and that, according to the compiler of Kings, Hezekiah was the first to destroy it when he suppressed idolatrous worship in Judah (2 Kings xviii. 4). It may be added that the source of the material in Nehemiah xiii. 16-21 is in no way original, for the coming of the Levites to the land and the rise of the noble agrarian patriarchalism, is manifestly a_product of the mind of the seventh or eighth century B.C., and was dominated by a Levitical spirit, but curiously shows that any retaliation upon Cain shall be avenged (seebelow, note 5).

With this development in Israelite religion, observe that Judaean cultic activity was continued in part by a Levitical author of a work which was ascribed to Moses, and that, according to the compiler of Kings, Hezekiah was the first to destroy it when he suppressed idolatrous worship in Judah (2 Kings xviii. 4). It may be added that the source of the material in Nehemiah xiii. 16-21 is in no way original, for the coming of the Levites to the land and the rise of the noble agrarian patriarchalism, is manifestly a_product of the mind of the seventh or eighth century B.C., and was dominated by a Levitical spirit, but curiously shows that any retaliation upon Cain shall be avenged (see below, note 5).

The name Korah itself is elsewhere Edomite (Gen. xxxvi. 5, 14, 18) and Calebite (1 Chron. ii. 43). See Ency. Bib., s.v.

some animus against the Aaronites (2 Chron. xxix. 34, xxx. 3). A Levite probably had a hand in the work, and this, with the evidence for the Levitical Psalms (see Psalms), gives the case an interesting place in the study of the transmission of the biblical records. But the history of the Levites in the early post-exilic stage and onwards is a separate problem, and the work of criticism has not advanced sufficiently for a proper estimate of the various vicissitudes. However, the feeling which was aroused among the priests when some centuries later the singers obtained from Agrippa the privilege of wearing the priestly linen dress (Josephus, Ant. xx. 9, 6), at least enables one to appreciate more vividly the scanty hints of internal jealousies during the preceding years.

4. Summary.—From the inevitable conclusion that there are three stages in the written sources for the Levitical institutions, the next step is the correlation of allied traditions on the basis of the genealogical evidence. But the problem of fitting these into the history of Israel still remains. The assumption that the earlier sources for the pre-monarchical history, as incorporated by later compilers, are necessarily trustworthy confines the inquiry (Gen. xxxv.), since this is the residuum of a larger work of a revising spirit in Jehu's age depends upon the critical assessment of the related records (see Josh., xvi. 11-14). The view that the Levites came from the south may be combined with the conviction that there Yahweh had his seat (cf. Deut. xxxii. 2; Judges v. 4; Hab. iii. 3), but the latter is only one view, and the traditions of the patriarchs point to another belief (cf. also Gen. iv. 26). The two are reconciled when the God of the patriarchs reveals His name for the first time unto Moses (Exod. iii. 15, vi. 3). With these variations is involved the problem of the early history of the Israelites. Moreover, the real Judaean tendency which associates the fall of Eli's priesthood at Shiloh with the rise of the Zadokites involves the literary problems of Deuteronomy, a composite work whose age is not certainly known, and of the twofold Deuteronomistic reduction elsewhere, one phase of which is more distinctly Judaean and anti-Samaritan. There are vicissitudes and varying standpoints which point to a complicated literary history and require some historical background, and, apart from actual changes in the history of the Levites, some allowance must be made for the real change of the circles where the diverse records originated or through which they passed. The key must be sought in the exilic and post-exilic age where, unfortunately, direct and decisive evidence is lacking. It is clear that the Zadokite priests were rendered legitimate by finding a place for their ancestor in the Levitical genealogies—through Phinehas (cf. Num. xxv. 12 seq.), and Aaron—there was a feeling that a legitimate priest must be an Aaronite, but the historical reason for this is uncertain (see R. H. Kennett, Journ. Theol. Stud., 1905; pp. 161 sqq.). Hence, it is impossible at present to trace the earlier steps which led to the grand hierarchy of post-exilic Judaism. Even the name Levite itself is of uncertain origin. Though popularly connected with ládah, "be joined, attached," an ethnic from Leah has found some favour; the Assyrian l'âd "powerful, wise," has also been suggested. The term has been more plausibly identified with lâdû (fem. lâdû), the name given in old Arabian inscriptions (e.g. at-ûlû, south-east of Elath) to the priests and priestesses of the Arabian god Yâdû (so especially Hommel, Anc. Heb. Trad., pp. 278 sqq.). The date of the evidence, however, has not been fixed with unanimity, and this very
attractive and suggestive view requires confirmation and independent support.

Authorities.—For the argument in § 1, see Wellhausen, Prolegomena, pp. 121-151; W. R. Smith, Old Test., in Jew. Church (2nd ed., Index, s. v. "Levites"); A. Kuenen, Hexateuch, §§ 3 n. 16; n. pp. 203 sq.; 15 n. 15 (more technical); also the larger commentaries on Exodus-Joshua and the ordinary critical works on the later part of the text.

In § 1 and part of § 2 use has been made freely of W. R. Smith’s article "Levites" in the 9th edition of the Enc. Brit. (see the revision by A. Bertholet, Ency. Bib. col. 2770 sq.). For the history of the Levites in the post-exilic and later ages, see the commentaries on Numbers (by G. B. Gray) and Chronicles (E. L. Curtis), and especially H. Vogelstein, Der Kampf zwischen Priestern u. Lekuten seit den Tagen Ezech. es, with Kuenen’s review in his Gesammelte Abhandlungen (ed. K. Budde, 1894).
